Institutional studies have always held an important place in economics. While the classical doctrine and its derivatives have tended to make them a subordinate category of description, they have occupied a position of great importance in the explanatory scheme of most dissenting individuals and schools. Thus the work of Sismondi and Richard Jones may be described as primarily institutional. The German historical school of necessity was deeply concerned with the changing structure of economic institutions and the progressive adaptation of life and thought to such change. Karl Marx' attention was centered upon the evolution of economic institutions in their relation to the distribution of economic power. Other socialist thinkers also examined the origin and effects of economic institutions as a preliminary to devising ways and means of reconstruction. In general the institutional interest has been tied to reform movements of one sort or another and has been antipathetic to economic explanations running in terms of uniform self-interest, static economic relationships and a stable institutional structure.

While institutionalism is a word applied specifically to a phase of economic thought in the United States, it stands in a close spiritual relationship to certain developments in all the social sciences both in America and Europe. Thus, to take American examples, the work of Roscoe Pound and R. L. Hale in jurisprudence, of Charles A. Beard and J. H. Robinson in history and government and of W. F. Ogburn in sociology is based upon a set of similar presuppositions. Among economists in both England and France the closest alliance with institutional theory is found among groups primarily interested in projects of reform, such as the French solidarists and the English Fabians. Even in the relatively orthodox precincts of the University of Cambridge the influence of Marshall has

stimulated an institutional interest, while Cannan at the London School of Economics has quite directly been responsible for a series of institutional studies, although not in the Veblenian terminology of American institutionalism. In Germany more than elsewhere may be found a rich development of ideas and activities like those in the United States. They are in part derivatives of the earlier historical and Marxian schools of economics, in part aspects of more recent sociological thought.

The institutional movement in American economics is peculiarly a derivative from the work of Veblen, although with his name should be linked that of C. H. Cooley and the pragmatic philosophical trend represented by William James and John Dewey. Much of Veblen's thought is compounded from the ideology of Marx and the historical school. What is most distinctive in it, however, is an introduction into economics of ideas derived from the evolutionary sciences, particularly biology, anthropology and psychology. Thus the central theses of Veblen are that human activity, including economic activity, may be most profitably approached from the angle of an evolutionary process; that institutions are decisive factors in shaping human behavior; that social science must deal with real human beings, not with a rationalized human nature, with the run of facts rather than with a normalized picture of them.

Stated in somewhat greater detail, the cardinal tenet of institutionalism is that contemporary society is a complex of institutions or habitual forms for organizing and regulating the behavior of individuals. Social institutions, including the economic, defined as those which bear on the behavior of individuals in providing the community with its complement of useful goods and which determine the manner of the control and use of these goods, are subject to change because of the impact of human nature, changes in technology and the general development of knowledge and ideas. In a certain sense the development of institutions is a competitive process, and its outcome determines what forms of behavior are acceptable and sanctioned. At any given time the behavior of individuals or groups is restricted within limits set by such formal or informal sanctions. Since in the view of psychologists "original human nature" is remarkably stable, most overt behavior must be explained by reference to the prevailing institutional structure, and this in its turn is intelligible only if viewed as a result of cumulative change.

The bearing of this general ideology on economics is in the first place critical. Institutionalism impugns the credibility of orthodox economic theory on the following counts: it asserts that orthodox economics depends upon a discredited hedonic theory of human behavior; that its basic institutional postulate of individualistic competition is inadequate and inaccurate; and that its central problem of determining the conditions of economic equilibrium rests on an untenable analogy to physical science and implies a static view of economic organization at variance with the actual processes of development. The institutionalists believe that while the equilibrium concept and the marginal method may be found useful for some subordinate purposes of analysis fundamentally correct explanations of economic phenomena are possible only by reference to the nature and prescriptive force of social institutions.

While the critical position which constitutes an essential ingredient of institutional economics is definite and clear cut, the positive content of institutionalism is not so well defined. In the nature of the case it is difficult to draw the boundaries of an economic science based upon institutional postulates. Since economic institutions, such as competition, the wage system, the credit system, the property system and the like, are but isolated aspects of a much more complex general structure of social institutions, the specific scientific boundaries between economics on the one hand and sociology, politics and jurisprudence on the other tend to become very indistinct. Moreover, since the raw materials of an institutional economics are of necessity a vast accretion of factual data, the institutional approach tends to realize itself in an unorganized and vaguely related congeries of separate studies, quantitative, descriptive or historical. In consequence there has been developed no technique of analysis, or methodology, of a uniquely institutional character. In fact, the common institutionalist attitude is that each economic study justifies itself on other grounds than those of method and that, methods being but instruments, each study may proceed with the aid of any extant methods of economic analysis or call into existence new methods. Thus is achieved a certain methodological elasticity in the treatment of social data, which are so complex that they must be subject to varied "approaches." In this there is striking contrast with orthodox economics, the peculiar strength of which is that it provides concepts and analytical procedure ap-

plicable to an unlimited number of detailed situations.

In discussions of methodology one rather commonly hears of the descriptive method, the quantitative method and the genetic method as adjuncts of institutional economics. This mode of speech involves some inaccuracy. Description, for example, can hardly be spoken of as a method, since realistic description of concrete data raises a host of problems of method with respect to categories, concepts and generalized results. The influence of the institutional approach in the field of description is, however, real and far reaching, not merely through promoting it but through attacking its problems in an experimental frame of mind. Thus institutionalism may alter the categorical framework of description; illustrations of this may be found in Hoxie's studies of labor organization, in studies of corporate organization and in other fields.

Quantitative analysis may be regarded as a specialized method of description, although a more ambitious theoretical destiny is held out for it. It has no particular affinity with institutional economics but has been linked to it as providing a type of institutional knowledge and perhaps a type of theoretical conclusion different in kind from the generalizations of orthodox economic theory. In this connection it is significant that the institutionalists regard W. C. Mitchell's treatise on *Business Cycles* (1913) as a positive contribution to their critical attack upon orthodox theory. Although quantitative analysis is no more allied to one type of theory than to another, quantitative studies have a very special interest for institutionalists and a special bearing on their system of thought, because they afford an opportunity and a justification on the grounds of expediency for arranging data in other categories and concepts than those crystallized in orthodox economic usage. In particular, quantitative-descriptive studies tend to present data in the categories in which they appear to those technically trained for, and actually engaged in, the various practical pursuits of life. For example, treatments of interest which deal with call money, commercial paper, bank loans, farm mortgages, public credit and the like are different in kind from systematic theories of interest but not an alternative to them. Another example is offered by studies of corporate organization and profits, a field in which the assumptions of general theory seem to have lagged behind the current facts. Such studies may be properly regarded as having an importance be-

yond the immediate end which induced them and as collectively furnishing data for extensive emendation of general economic theory.

The so-called genetic method, the explanation in terms of cumulative causation, may perhaps be regarded as a distinctive institutionalist method, although it has also been championed by such representatives of the German historical school as Karl Bücher. If contemporary phenomena are the outcome of a cumulation of causes in past time, they cannot be properly or accurately analyzed on causal lines without recourse to the genetic principle. In pressing this point home, in suggesting that orthodox theory is rationalized description and sometimes an apologetic rationalization of the economic institutions of a limited area and period, institutionalists have made orthodox theorists self-conscious and are in part responsible for the recent careful and modest statements of the functions of orthodox theory.

Unfortunately, in their enthusiasm for the genetic principle the institutionalists have overlooked its inadequacies as the sole method and the dangers often implicit in it. In its usual form of a translation of a limited number of historical sequences into terms of cause and effect it is of doubtful scientific accuracy. Nor is it capable, except when used in conjunction with deductive logic, of providing precise answers to many if not most of the analytical problems with which economists are faced. Institutional thought, which seems at times to regard the genetic method as an alternative to the allegedly invalid deductive method of generalizing on economic causation, seems not to have grasped the exact significance of the genetic principle.

On such methodological questions American institutionalism has not been as penetrating as might be wished. The methodological writings of Max Weber, who may be regarded as the champion of institutionalist economics in Germany, present the problem of "understanding the phenomena of life in their cultural significance" with more illumination. Having decided to eliminate analogies to the natural sciences as inapplicable, having discussed the objective and subjective aspects of the social scientist's work and the impossibility of creating a direct nexus between scientific knowledge and social policy, he adopted "ideal types" as his chief methodological instrument for the attainment of the necessary degree of abstraction in dealing with complex social data. This device, which isolates and synthesizes into a logically consistent picture

factors deemed relevant to the historical development of the process under investigation, is a particular application of the genetic principle. It is, however, also open to the objections that rigid "ideal types" will command no consensus of support and that their very construction is a highly personal performance permitting the penetration of bias.

American institutionalist writing on methodological questions has taken the form of sections and chapters in books devoted to other subjects and of occasional articles in periodical publications. It has been on the whole of a very inferior or else very fragmentary character; it has not attempted, as J. R. Commons justly observes, "to go at the fundamental concepts upon which the institutional school should be constructed." American institutionalism is far from having thought through its problems when it criticizes economic doctrines so stated as to be unamenable to empirical verification and praises the quantitative method of analysis for the connection of its data with concrete reality, at the same time that it places reliance upon something yielding such vague and highly personal interpretative results as those of the genetic method. Actually, the institutional interest is for things in flux, and it has stood ready to approve whatever methods are applicable for the presentation or interpretation of processes of economic change. One cannot quarrel with this interest, but one may doubt whether it need carry with it an exaggerated dissent from the methods of presenting and interpreting the elements of economic stability and order which are the stock in trade of orthodox economic theory.

The tendency has been for institutional economics to make a virtue of its shortcomings. It has not regretted its inability to construct economic laws; on the contrary, it has neglected and tended to deride studies largely dependent upon a formal economic logic. It has applauded studies of the derivation of the contemporary institutional structure on the one hand and statistical or other accounts of observed behavior on the other; it has favored the multiplication of monographic studies. But it has achieved no synthesis of its data, no general plan wherein its parts will fit, no alternative methods or concepts of general applicability. In fact, it has found a source of gratification in changing economics into a collection of diverse types of study, so long as these offer a concrete body of knowledge relevant to understanding the economic order. In much of this it appears to be repeating the experience of

the historical school, which it so greatly resembles and from which it in part derives.

One reason for the lack of interest on the part of institutionalists in questions of method and system is that the thought and work of most institutional economists actually center less upon problems of scientific explanation than upon those of public policy. Their orientation is primarily a welfare and reform orientation. Centering their attention upon the mutability of institutional structure, they quite generally regard their function as that of bringing disinterested human intelligence to the guidance of social change.

It has been suggested that institutional economics consists of studies of three types: genetic studies, studies of the economic significance of single institutions and studies of typical economic structures in terms of economic functions and types of organization. While this classification indicates the emphases which are common to institutional studies, it offers no clue to the positive content of institutionalist economics. In the absence of a consensus as to the concepts and categories which should govern such studies, of homogeneity in plan and method and of a unitary framework the content of institutional economics can only be described as the aggregate result of all these studies irrespective of the methods by which they have been pursued. Another difficulty in this connection arises from the fact that many notable studies of economic institutions have been made by persons who do not ally themselves with a dogmatic acceptance of the institutionalist approach to economic theory. Such studies cannot, however, be excluded from the range of institutional economics.

Of the branches of economic inquiry in which the institutional approach has proved most fruitful the field of business organization stands out prominently. In this field belong on the one hand studies such as W. H. Hamilton's *The Case of Bituminous Coal* (1925), which combine description with theoretical analysis, and on the other theoretical and interpretative writing like that of Veblen in *The Theory of Business Enterprise* (1904) and *Absentee Ownership* (1923) and of J. M. Clark in his *Studies on the Economics of Overhead Costs* (1923) and the *Social Control of Business* (1926). Recent studies of corporation law in an institutionalist setting, such as those of A. A. Berle, may also be properly considered as an investigation into the genesis and functioning of an important form of business organization.

In the field of labor organization one finds also

a mass of writing, descriptive and interpretative, much of which partakes of the institutionalist spirit. At the head of such works must of course be placed the Webbs' *The History of Trade Unionism* (1894) and *Industrial Democracy* (2 vols., 1897). Hoxie was perhaps the most conspicuous American figure giving an institutionalist interpretation of the labor movement. Other works, such as Carter Goodrich's *The Miner's Freedom* (1925) and Solomon Blum's *Labor Economics* (1925) and the statistical and other writings of Leo Wolman and Isidor Lubin, are similarly related to the movement. One cannot of course overlook the important work of Commons in the labor field, but his interest in relating this work to a new theoretical orientation is a relatively late development.

As in other fields of inquiry, no type of theoretical orientation has any peculiar affinity with research in the field of business fluctuations. It is perhaps an accidental circumstance that one of the most distinguished American proponents of the institutional point of view, W. C. Mitchell, is also the author of the outstanding study in this field. Yet it is undoubtedly true that cyclical studies have not only attracted persons of institutional leanings but have strongly reenforced the effort to study economic phenomena in process, as opposed to analysis of the normal operation of economic forces, and to restate economic theory in these terms. They have impregnated with new meaning the distinction between statics and dynamics current in orthodox economics. In the work of J. M. Clark in the United States and of the German economists who differentiate between structure and conjuncture and attempt the establishment of a dynamic methodology there is promise that the study of business cycles will eventually lead to the formulation of a new theory of dynamic economics. Nevertheless, it is doubtful that quantitative cyclical analysis has the close affinity to institutionalism which is sometimes attributed to it.

The genesis and development of such complex sets of institutions as capitalism in its various aspects constitute a subject peculiarly attractive to the institutionalist. In this field one must notice particularly Werner Sombart's *Der moderne Kapitalismus* (3 vols., 1902-27). In distinguishing the three elements of spirit, form, and technology and carrying them through the evolution of economic institutions Sombart has not merely added vastly to the factual knowledge of the past but has developed an interpretative scheme representing an example of that eco-

economic theory which Veblen has called "the theory of a process." In his sociological writings Max Weber has dwelt at length upon spiritual elements which underlie social institutions; his studies of the relation between the Protestant ethic and the spirit of capitalism offer a particularly penetrating contribution to the literature of economic institutions. A somewhat comparable contribution in this field is R. H. Tawney's *Religion and the Rise of Capitalism* (1926). Veblen is the only recent American economist to attempt historical analysis of a theoretical and interpretative sort, but what he did (e.g. in *The Instinct of Workmanship*, 1914) stands almost as the foundation of institutional economics and furnishes the basis for classing such men as Sombart and Weber with institutional economists. Commons' *Legal Foundations of Capitalism* (1924) must be added to the list of important works in this field. Although it covers a relatively short period and was preceded by a number of studies on the economic significance of property and contract it may be said to open a new branch of inquiry because it represents a peculiarly skilful handling of legal material for the purposes of well considered and thoroughly grounded economic generalization.

This brief survey of the institutionalist contributions may not be concluded without mention of the work of C. H. Cooley (*Social Process*, 1918; *Social Organization*, 1909) and of B. M. Anderson, Jr. (*Social Value*, 1911). The former is second only to Veblen in his general influence in establishing the institutional point of view, while the latter is the only American writer except Commons to attack the problems of economic value from the angle of institutionalist preconceptions.

It is impossible at present to give a definitive evaluation to institutionalism in the context of the historical development of economic thought. The institutionalists constitute one of the most active groups of economists today, and it is impossible to anticipate what will be the final impact of their thought upon the general body of economics. So far one effect of the movement has been to wear down the entrenched authority of the orthodox discipline, until it no longer can be regarded as providing the exclusively correct explanation of economic phenomena or the exclusively accredited instruments of economic analysis. Besides stimulating a large amount of useful research and analysis, oriented with reference to a postulated evolution of institutional structure, the movement has fertilized economic

thinking at large by the infusion of new and relevant ideas. Having failed, however, to create a complete alternative organon of economic thought and seeming unlikely to do so, its separate and controversial existence appears due to be ephemeral. In the synthetic and creative construction of an adequate organon, which is the present task of economic theorists, the influence of the institutional movement will be large; but the outcome should be something larger, something better equipped methodologically than the institutional approach alone appears able to achieve.

A., "The Trend of Economics" in his *Economic Problems, New and Old* (Boston 1927) p. 232-60; Copeland, M. A., "Economic Theory and the Natural Science Point of View," and Burns, E. M., "Does Institutionalism Complement or Compete with 'Orthodox Economics'?" in *American Economic Review*, vol. xxi (1931) 67-87.

EDDY, MARY BAKER (1821-1910), American religious teacher and organizer. After a few years of elementary schooling in New Hampshire this temperamental girl was kept at home until at the age of twenty-two she married. Her husband soon died of yellow fever, and from the birth of her son until 1862 she suffered from severe hysteria. In 1853 although an invalid she married a dentist who was unable to support her and left her at the outbreak of the Civil War.

Dr. Phineas P. Quimby, a mental healer at Portland, Maine, succeeded in restoring her to comparative health after a brief treatment. After 1862 she traveled in eastern Massachusetts, trying with little success to make a living by practising Quimby's art. In 1866 as a result of a fall she

suffered a temporary relapse, but recovery was rapid and according to her later theory miraculous. In 1875 she abandoned Quimby's technique of healing by "manipulating" and claimed that in 1866 she had discovered the principles of Christian Science. From 1870 to 1880 she taught her "science" to students at Lynn, Massachusetts. In 1875 the first edition of her textbook, *Science and Health*, appeared and in 1876 was formed the Christian Scientists' Association, which became The Church of Christ (Scientist) in 1879. In 1877 she married one of her students, Asa Gilbert Eddy. In 1882 she moved to Boston, where she founded the Massachusetts Metaphysical College. Her work prospered and she was soon able to send "spiritual healers" to many American cities. She enlarged and with James H. Wiggin's help improved her textbook. In its fiftieth printing (1891) the book, which is the chief basis of Christian Science, appeared in essentially its present form. After a serious schism among her students she closed the "college" in 1889 and obtained autocratic control of the Mother Church; she then retired to Concord, leaving its actual management to a board of directors. Rumors spread that she was failing in body and mind. Although she suffered periodically from violent hysteria and delusions of persecution she administered church affairs skilfully until almost the end of her life.

EDELMANN, JOHANN CHRISTIAN (1698-1767), German free thinker. Edelmann was born in Saxony and was at first a follower of the traditional Lutheran orthodoxy. He became, however, profoundly influenced by his reading of Pietist literature, especially Gottfried Arnold's *Unpartheyische Kirchen- und Ketzerhistorie* (2 vols., Frankfurt 1699-1700), and as a result became filled with "real disgust" for orthodoxy. In his *Unschuldigen Wahrheiten* (Bückeburg 1735-43) he began his attacks upon the Lutheran orthodoxy and proclaimed the equal value of all creeds. He familiarized himself with the writings of Dippel and accepted his rationalist

principles, even his Socinianism. In 1735 Edelmann visited Zinzendorf in Herrnhut in order to become better acquainted with the Pietism of the Moravian Brethren. He also collaborated in 1736 in the Berleburg translation of the Bible. Gradually, however, he came under the influence of the English deists and especially of Spinoza. In his *Moses mit aufgedecktem Angesicht* (Berleburg 1740), *Die Göttlichkeit der Vernunft* (Berleburg 1741) and *Glaubensbekenntniss* (Frankfort 1746) he popularized the ideas of Spinoza and expounded his own radical criticism of the Bible and a pantheistic and immanent form of rationalism. He aroused the hostility of the theologians, and only after promising not to publish any further writings was he given permission by Frederick the Great in 1746 to live in Berlin.

Edelmann was the most hostile as well as the most influential German critic of orthodoxy before Reimarus and Lessing. He showed the inconsistency of orthodoxy with the early Christian faith in a perspicacious and dexterous manner. He reduced the religion of the church to politics and private mysticism and secularized it until it became a mystico-immanent anthropology and sociology. This vague pantheism and this intellectualistic religion of cultural improvement was unable, however, to exercise a positive and enduring effect. Edelmann's writings were rediscovered in the nineteenth century by Bruno Bauer. The latter represented him as an atheist who had anticipated Bauer's own development from an orthodox theologian to an atheist and denier of religion and as one whose life demonstrated the truth of the theory that subjective Pietism necessarily disintegrates the orthodox creed and produces, as a kind of secularization, the modern individualistic civilization.

EDEN, SIR FREDERICK MORTON (1766–1809), English economist. He was a founder and chairman of the Globe Insurance Company. In his monumental work, *The State of the Poor* (3 vols., London 1797), he describes parish by parish the conditions of life of the English laboring classes at the close of the eighteenth century. He was moved to undertake this survey, he tells us, “from motives both of benevolence and personal curiosity” as to the high prices of 1794–95 and the distress caused by them. He prefaces his study with a historical account of the operation of the British poor laws and an attack on Pitt’s proposed extensions. To make this survey Eden adapted his questionnaire from that used by Sir John Sinclair in his *Statistical Account of Scotland* (Edinburgh 1791–99), employed a field agent for over a year, visited certain localities himself and prevailed upon “respectable clergymen and others” to help collect his material. His harvest is a mass of concrete data covering for large parts of England the typical “diet, dress, fuel and habitation” of laborers, their occupations, their wages, their friendly societies, the trend of population, the rent and distribution of land and the organization and conduct of local workhouses. The core of his work is a series of family budgets from each locality. The book is still a mine of information for the student of eighteenth century England, and Eden’s method has inspired the social statisticians of succeeding generations.

Eden’s attitude is one of *laissez faire*. He uses the more frugal living and lower scale of relief in the northern counties to prove that not wages but improvidence is at fault in the south and insists that not the landed interests but the “marked favour shewn to commerce” causes the disproportionately low wages of agricultural labor. In spite of this differential he finds that “Manufacturers more commonly become Paupers than Labourers in Husbandry.” Calling Adam Smith to his support, Eden concludes that the growth of friendly societies rather than a minimum wage and poor laws will best help the laboring poor. He represents the ruthless new husbandry of Arthur Young against the yet newer humanitarianism of Davies and Whitbread. His later works include an *Estimate of the Number of Inhabitants in Great Britain and Ireland* (London 1800) and an *Address on Maritime Rights* (London 1808), in which he favored firm opposition to the neutrality claims of the United States.

DOROTHY W. DOUGLAS

EDGEWORTH, FRANCIS YSIDRO (1845–1926), English economist. He was born at Edgeworthstown House, County Longford, Ireland, where the family had established itself in the reign of Queen Elizabeth. He was a grandson of the celebrated Richard Lovell Edgeworth, a nephew of the novelist Maria Edgeworth and a first cousin of the poet Thomas Lovell Beddoes. Late in life Edgeworth succeeded to the family property, and on his death his branch of the family in the male line became extinct.

Brought up at Edgeworthstown under tutors, he went at the age of seventeen to Trinity College, Dublin, and then to Oxford. His classical education colored his entire life; he was one of the few survivors of the tradition of free quotation from the classics on all occasions and in all contexts. He was first a lecturer in logic and afterwards Tooke professor of political economy at King’s College, London. In 1891 he succeeded Thorold Rogers as Drummond professor of political economy at Oxford and was elected a fellow of All Souls’, which became his home for the rest of his life.

Edgeworth never composed a magnum opus, which would have been entirely contrary to his temperament and inclinations. Early in life he produced three slim volumes, *New and Old Methods of Ethics* (Oxford 1877), *Mathematical Psychics* (London 1881) and *Metretike* (London 1887). Of these only the second is important, the latter part of it containing the essence of much of Edgeworth’s most characteristic work on mathematical economics, in particular the treatment of contract in a free market (his famous contract curves first appear here) and its possible indeterminateness. For the rest of his life he was content to offer the world his contributions to science in the form of numerous papers in a considerable range of learned periodicals. His work falls into two well defined groups, those dealing with the theory of probability and statistical theory, concerned mainly with the law of error, and those dealing with economics. The former papers, more than fifty in number, have not been collected. A list of those published before 1887 is given in an index to his *Metretike*. A list of the more important, bearing on probability, published before 1921, is given in the bibliographical appendix to Keynes, *A Treatise on Probability* (London 1921). Professor Bowley has summarized Edgeworth’s contribution to the theory of the law of error in a volume entitled *F. Y. Edgeworth’s Contributions to Mathematical Statistics*, published by the Royal Statistical

Society (London 1928). His principal papers on economics, on the other hand, were collected by himself toward the end of his life, thirty-four papers and seventy-five reviews being reprinted in his *Papers Relating to Political Economy* (3 vols.), published by the Royal Economic Society (London 1925). These three volumes, together with *Mathematical Psychics*, preserve in accessible form all of Edgeworth's contributions to the subject of economics which he wished to see preserved. The opportunity thus offered of obtaining a general conspectus of Edgeworth's work added greatly to his reputation. Most present day students of mathematical economics would probably consider Edgeworth the most eminent of nineteenth century pioneers in this subject.

The connecting link between Edgeworth's different works is to be found in his interest in the problems of measurement applied to the so-called moral sciences, or, as he expressed it in his early work, mathematical psychics. He conceived this subject as having five branches—the measurement of utility or ethical value, the algebraical or diagrammatic determination of economic equilibriums, the measurements of belief or probability, the measurement of evidence or statistics and the measurement of economic value or index numbers. Almost all Edgeworth's work falls into one or other of these five groups, his many contributions to the subject of index numbers being particularly important.

Edgeworth's other main work was connected with the *Economic Journal*, of which he became the editor on its first foundation in 1891. For the last thirty-five years of his life, first as editor, then as chairman of the editorial board and finally as joint editor, he devoted a great part of his time to this journal. Its traditions still owe much to his wisdom, his scientific tolerance, his wide international sympathies and to his practical good sense, which he combined with a measure of personal eccentricity and idiosyncrasy.

J. M. KEYNES

Consult: Keynes, J. M., in *Economic Journal*, vol. xxxvi (1926) 140–53; Brinkmann, C., in *Archiv für Sozialwissenschaft und Sozialpolitik*, vol. lvi (1926) 524–30; Schumpeter, J., "Edgeworth und die neuere Wirtschaftstheorie" in *Weltwirtschaftliches Archiv*, vol. xxii (1925) 183–202; Weinberger, Otto, in *Jahrbücher für Nationalökonomie und Statistik*, vol. cxxiv (1926) 205–17; March, L., "F. Y. Edgeworth et les indices des mouvements des prix" in *Société de Statistique de Paris, Journal*, vol. lxxviii (1927) 261–66; Bowley, A. L., *F. Y. Edgeworth's Contributions to Mathematical Statistics* (London 1928).

EDGEWORTH, RICHARD LOVELL (1744–1817), Irish writer, inventor and educational reformer. Edgeworth was educated at Trinity College, Dublin, and at Corpus Christi College, Oxford, lived for a time in England, became prominent in the Lichfield circle of wits and cultured radicals and in 1782 settled on the family estate at Edgeworthstown, Ireland, where he became a philanthropic and popular landlord. He married four times and had nineteen children. In the last Irish parliament he voted against the Union. He invented a telegraphic system and anticipated caterpillar traction. Of inquiring mind and buoyant temper, public spirited, energetic, humorous and affectionate, Edgeworth was a pioneer of child study and of experimental methods in teaching. His early enthusiasm for Rousseau had become chilled after bringing up his eldest son according to the principles of *Emile*, and he entered upon a search for practical processes to replace a priori theories. He laid stress on home education but recognized the value of public instruction. In *Essays on Professional Education* (London 1808, 2nd ed. 1812), written while he was serving on a commission of inquiry into Irish education, he urged the comparative study of various school systems. Influenced by French writers he envisaged a scheme of national education, including secondary schools—Edgeworth was probably the first English writer to use the term—in which advancement from grade to grade would depend upon merit ascertained by public examination. In *Essays on Practical Education* (2 vols., London 1798; new ed., 3 vols., 1822) he had collaborated with his famous daughter, Maria (1767–1849). The book was suspect in evangelical circles but the joint authors put it on record that they deemed "religion the only certain bond of society." A register reporting actual conversations with the Edgeworth children at various stages of their development formed the basis for the essays and gave to *Practical Education* a foundation of carefully recorded experiences which distinguished it from most other pedagogical works of its time.

Possessing great talents as a story teller Maria Edgeworth developed under her father's unwearied direction into an eminent writer of moral tales. As a medium for illustrating the precepts gleaned from her experience she employed the didactic story. These tales, collected in *The Parents' Assistant* (London 1796, new ed. 1897) and *Early Lessons* (London 1802, new ed. 1857), immediately took a prominent place in con-

temporary children's literature. Of her numerous novels *Castle Rackrent* (London 1800) is a strikingly realistic portrayal of Irish social conditions and character. Her writings impressed Turgenev, then just beginning his descriptions of Russian life, and Walter Scott, who declared that she had inspired him to depict Scottish character. *The Absentee* (London 1812), *Ormond* (3 vols., London 1817), *Belinda* (3 vols., London 1801) and other novels were primarily directed toward inculcating the "practise of the moral virtues which constitute human happiness." The extent of her preoccupation with social problems is indicated by the opinion of a contemporary writer, Madame de Staël, that Maria Edgeworth "s'est perdue dans la triste utilité." She was at her best when under the stimulus of her father's lively mind.

EDMONDS, THOMAS ROWE (1803-89), English social theorist. After graduating from Trinity College, Cambridge, Edmonds published *Practical Moral and Political Economy* (London 1828), a comprehensive treatise presenting his view of social philosophy and a constructive, if in its principles highly revolutionary, scheme for the establishment of a "social system." Affiliated in general background with the Owenite socialists, Edmonds accepted the Ricardian laws of value and distribution as necessarily valid for the system of private property and after a detailed analysis of the fundamental needs of society concluded that the operation of these laws, coupled with general ignorance, alone prevented the attainment of human happiness. If private property were abolished, the labor of each adult male for two hours a day would suffice to supply the entire community. Delving into the problem of dissipating ignorance, Edmonds constructed in book III of his work what was in reality a complete and strikingly original system of social psychology; this aimed to show that all aspects of group culture including public opinion and national characteristics had their source in natural instincts, from which they developed by processes of association and memory. At this point Edmonds adumbrated a theory of

evolution resting on the assumption that knowledge is power and leading to the conclusion that the nation which acquired the best methods of controlling the processes of mental and spiritual growth—Edmonds thought it would probably be Great Britain—would become the nucleus of a world state. The means selected by Edmonds as the most conducive to the achievement of social perfection were, besides education, the stimulation of the instinct of gregariousness, the abolition of competition, which he regarded as an obstacle to advantageous division of labor, and the practise of eugenics. As he envisaged it in book IV of his work the structure of his "social system" involved, not unlike the Soviet system, a hierarchy of regional and professional councils for self-government. But lacking confidence in the working classes as agents of their own reform Edmonds believed that the change must be effected from above by the political powers and that it might come gradually. The strengthening of this conservative tendency was indicated by the publication of his *Enquiry into the Principle of Population* (London 1832), in which he considered various plans for the immediate amelioration of social poverty, "the nutriment on which sedition feeds" (p. ix). Among his most original suggestions were national reorganization of poor relief, national insurance for workers, state construction of public utilities, civic development and town planning and the encouragement of education and of a free press.

In 1832 Edmonds became actuary of the Legal and General Life Assurance Society, a post which he held for thirty-four years. Henceforth he devoted himself to problems of vital statistics. In his *Life Tables* (London 1832) he tried to show that the tendency of mortality can be reduced to a law of geometric proportion. This law he expressed by an algebraic formula which closely resembles the celebrated formula stated by Gompertz, although Edmonds insisted upon the independence of his conclusions. Between 1835 and 1862 Edmonds published many articles in the *Lancet* dealing largely with population, mortality and laws of sickness.

EDUCATION, PRIMITIVE. Primitive education, the process by which preliterate peoples induct children into the cultural tradition of

the tribe, is characterized by a very great variety of theories and practises. Different societies select diverse customs for explicit emphasis. The Manus of Admiralty Island give definite early training in the respect for property; Samoans neglect to give any such specific instruction to their children, yet adult Samoans like adult Manus habitually respect property and property rights. Etiquette may be taught very early, as among the Omaha Indians and the Samoans, or the children may be given unbridled license for years, as among the Manus, yet in all three societies the adults observe the customary rules of etiquette. The Manus spend a great deal of time in teaching small children to make correct physical adjustments; the Samoans leave these same adjustments to the casual care of slightly older children and to the processes of imitation. The Kaffirs of South Africa and the Manus do not demand social responsibility from their children until they reach or pass puberty, while the Cheyennes and the Omahas treated the smallest child as an inefficient but nevertheless responsible member of society. A people may select a single technical skill to be taught by social and religious elaboration, as did the Maori in the case of weaving and the Fijians in the case of the art of war, or they may permit their young people to acquire these same arts through play and casual imitation of adult activity, as in the making of mats in Samoa or in the case of the art of spear throwing among the Manus. The importance of the child's role in the community and the consequent attention which is lavished upon him may wax or wane with age: among the Manus young children of two or three are considered of paramount importance and the developing individual is accorded less and less general recognition until after the first few years of married life; in Samoa status and age are positively correlated. The standard set and the progress made by children may be determined by an individual standard, as among the Manus and apparently also among the Plains Indians, or by a group standard, in which a child is expected to approximate only to the average of its age group, as in Samoa. Differentiated behavior for the two sexes may be insisted upon at a very early age or not until puberty, and it may be of different sorts. There may be similar games but sex segregation, as in Samoa; or no sex segregation but an early differentiation of types of play, as among the Manus; or the children's group may be regarded as a unit in

society, as in the children's camp of the Plains Indians or the Kaffir children's play communities, which had their own rules and regulations.

Adults are guided by varying conceptions of the child, who may be regarded as an adult in miniature moved by the same motives which actuate his elders, as among the Plains Indians, or as an unaccountable and irritating creature to be deceived, threatened and intimidated, as among the Kaffirs. There is also a wide variety in the self-consciousness with which the society views any of the processes of education. Among the Manus each child learns to swim by playing with slightly older children and in the same way he learns to beat a slit drum, to throw a spear or shoot a bow and arrow; the elders applaud informally but take no formal part. In Samoa the small child's debut on the dance floor is carefully stylized. The Plains Indians were notable for the degree of conscious instruction which was given children through legends and long moral homilies; among the Omaha a father began to train his young sons into a mystical receptivity to the supernatural at a very early age. Similarly, a Dobuan child is taught magic from his earliest years and is also required to plant and till a small garden plot of his own. The Manus children never receive any formal instruction in religion, magic and the arts; physical proficiency, automatic respect for property and intense prudery are instilled more by chastisement and communicated effect than by any formal appeal to reason.

Methods by which the points that the society has selected for emphasis are enforced upon recalcitrant children also vary widely. The Zuñi Indians fiercely deprecate parental corporal punishment but subject the child to the far more nerve racking experience of being whipped by the masked scare dancers. The Samoans have adopted the disciplinary technique of punishing not the culprit but the next oldest child, who is viewed as being responsible for the younger child's good behavior. The Manus punish a child before the age of three for infractions of the rules of physical training and respect for property but then permit the child to gain the upper hand and control the parents through sulking and threatened withdrawal of emotional allegiance—the parents reserving as a weapon the sense of shame which has been instilled into the young children and which can later be invoked to enforce tabus and social conformity. Attitudes toward the pace at which the child should acquire its cultural tradition

and attempt to participate in adult activity also vary from the Samoan deprecation of all precocity to the gentleness and care with which the older men among the Cheyenne protect a child member of a war party against the teasing of the young men.

In spite of the greater frankness which characterizes much of primitive life there is wide divergence in attitudes toward sex knowledge and sex behavior. Seemliness is enjoined upon children in Samoa and in the Trobriands as the standard of sex behavior; Dobuan children are permitted a license in speech which would be a matter of insult if spoken by an adult; Manus children are denied the slightest approach to sex play. Manus parents make every effort to prevent their children from witnessing sex activity, while Samoan children make a game of spying upon lovers. In Samoa the youngest child is permitted to witness childbirth, but the Kaffirs felt constrained to lie in answer to children's questions about the facts of pregnancy and birth.

The role of the parents, the grandparents and the older siblings is very differently conventionalized among different peoples. In many parts of Melanesia the father's role is that of an affectionate and indulgent nurse, which may be further elaborated by the contrast between the gentleness of the father and the sternness of the mother's brother, who in matrilineal societies assumes disciplinary authority. Among the Kru, however, a strong development of patriliney casts the father in a stern role from earliest childhood. Among the Omaha Indians the moral and disciplinary role was taken over by the grandparents; the parents apparently remained the subjects of active identification, so that a split between moral discipline and affectionate identification may have occurred. In matrilocal residence a child may find refuge from too much teasing in the arms of the husbands of his mother's sisters, as among the Zuni Indians. The strong emphasis upon the fostering role of the father for young children of both sexes among the Manus results in the mother's taking a secondary role, which later complicates her daughter's satisfactory identification with her own sex. Rank within the household may have a strong influence upon the child's development, as in Samoa, where association between men of rank and young children is socially forbidden. The extension of the biological family to include in a close residential unit some dozen to two dozen rela-

tives results in a child's always having brothers and sisters of various ages and makes the sibling relationship a dynamic one educationally. The opposite condition found in Dobu, where each small biological family lives by itself and the child is continuously with its parents, prevents the sibling relationship from any important functioning.

The degree to which the supernatural is invoked as a disciplinary measure also varies arbitrarily. The Kaffirs invoked monsters in whom they do not themselves believe in order to intimidate the children; the Manus rely more upon scare stories of land devils than upon the ancestral spirits in fear of which the community of adult Manus lives; the Dobuans early instil into their children a lively fear of the sorcery of members of other villages and this same fear is a powerful social deterrent in adult life.

Because initiation and puberty rites are conspicuous and lend themselves easily to description, there has been an overemphasis upon their educational significance. Puberty rites are characteristic not of all primitive societies but of some cultural areas in which particular and usually contiguous or related social groups have selected the period of puberty for social, economic, religious or educational elaboration. Initiation ceremonies for boys and girls are also found to have definite geographic distributions. Where either puberty or initiation rites occur, these ceremonies may have an explicit educational reference, as among the Koko Papuans, where consecutive religious training is given to the segregated boys; or they may be merely the admission of the initiate into some secret of adult life. Puberty ceremonials for girls may be oriented to their future success and moral and social achievement, as among the Thompson Indians, where the girl performs symbolic acts which are believed to encourage her magically and practically in various desirable moral traits; or they may be oriented to a protection of the community of the girl from maleficent supernatural influences, as in various parts of California; or they may be definitely directed toward beautifying the girl, as among the Gilbert Islanders and in east Africa. In the Gilbert Islands the nubile girl must remain in a hut which is shrouded from light in order to beautify her complexion, making any industrial pursuit impossible; but moral and legendary exhortation is given her by some elderly female relative. On the other hand, there are many cases, as among the Dobuans, where there is

no social recognition of puberty for educational or any other purpose. Puberty only becomes a crisis if the society has so conventionalized it; it is not necessary to tide an individual over the period of physiological puberty nor the period of social acceptance into the adult group unless that adult group has first phrased either one or both of these universal experiences as some sort of dangerous ordeal.

Definite social institutions designed primarily or at least in part for the instruction of the young are the exception rather than the rule in primitive society. They do not correlate with the amount of esoteric lore to be learned or the difficulty and intricacy of any technique which is to be handed down from specialists in one generation to novitiates in the next but are special developments. The formal training given the priestly novitiate in the Whare Wananga, the sacred college of the Maori, observed all the customary formalities of instruction such as common residence, a teaching class, examinations and graduation—although these were muffled in magical practises which cloud the analogy. Among the Zuni, on the other hand, where there is apparently far more ritual to be memorized, no such institution is developed. A similar contrast is found between instruction in the art of housebuilding in Samoa and among the Indians of the northwest coast of America. Housebuilding in Samoa although not remarkably complicated was in the hands of a definitely recognized group of craftsmen, and apprenticeship to this group and recognition by it were necessary before an individual could become an accepted housebuilder. No such institution is found on the northwest coast, although there more elaborate houses are constructed. In Polynesia the emphasis upon payment for magical or traditional information is lacking; in North America payment between the novice and the master is strongly conventionalized. Where hereditary professions are found in a stratified society, such as in Africa with its smith's group or in India, the problem of technical education receives a special emphasis. The lack of correlation between the formality of training and the complexity of tradition no longer obtains when the tradition becomes as complex as that of ancient Mexico or Peru.

Primitive education, whatever its methods, whatever the age at which formal training is given, regardless of who the teacher is or what disciplinary means are employed, is from a superficial angle uniformly successful. In all

cases the tradition of the society is absorbed by the young. As primitive education does not aim at improvement or at innovation, the standards which modern educational philosophers set up cannot be applied to it. Although divergent societies seem to attain objectively similar results, more detailed studies of primitive education, using as criteria the special consequences to the individual rather than the general results for the society as a whole, may provide data showing differential results. The varying ages at which different social attitudes and habits are instilled may be found to be a decisive factor in the peaceful adjustment of the individual to the demands of his society. Whether respect for property is made an automatic response, as among the Manus, or is enforced by fear of sorcery, as in Dobu, or by the fear of vendetta, as in Ifugao, may make a significant difference. The relative degree to which affection, fear or shame are utilized as socializing techniques may also be found to have important reverberations in the individual personality. The institutions of social control in any society may be found to be in some measure necessitated by or at least responsive to the type of training which is given the children, to the sex, age and relationship of the teacher, to the age of the child and to the techniques of training which are employed.

Striking contrasts are found when primitive education is compared with education in modern society. Modern education is a formal institution integrated with economic and political institutions, a fact which tends to obscure the essential similarity in all societies of the purpose of a total educational process, which may be defined as the assimilation of each individual to a cultural tradition. The great accumulation of knowledge and techniques in a society with a written tradition, a huge population and extensive division of labor makes the educational process impinge differentially upon members of the growing generation. The heterogeneity of contemporary culture also results in propagandist groups developing educational institutions of their own. Although modern man like primitive man cannot teach his children anything which some adults in the culture have not already mastered, it is possible to change so radically the proportions among those who learn different aspects of the accumulated tradition that profound quantitative changes may be wrought in society. It is for this reason that primitive education appears to be much more

static than does education in our modern civilization.

HISTORY. Education is as old as the human race. Indeed it may be much older, depending on the definition employed. Some would make education as broad as the learning process and thus include within its ample domain types of behavior common to all forms of animal life; some would confine it to the induction of the maturing individual into the life and culture of the group; others would restrict the concept still further to the conscious and purposeful control of learning by the more experienced members of society; and still others, reflecting the popular mind, would limit education to the work of certain special agencies, such as the tutor and the school, which presumably are devoted exclusively to the twofold task of teaching and learning.

If education be regarded primarily as the induction of the maturing individual into the life and culture of the group and if the group be broadly conceived to include the dead as well as the living, then this process is clearly essential to both the renewal and the growth of human society. In its absence the achievement of men would be limited by the powers and to the experiences of the individual, and what is known as culture could not develop.

Among primitive peoples formal and institutionalized education plays a distinctly minor role. The school is entirely absent. Organized and systematic instruction of any kind is restricted to very narrow areas. For the most part the individual is inducted into the life and

culture of his group by the process of living itself, much as he learns to speak his native tongue in the more advanced societies. But as knowledge grows and the social structure undergoes differentiation there appears a special class of persons, variously known as priests, shamans, wizards or medicine men, who increasingly take charge of group ritual and oversee the religious and moral instruction of the youth. Moreover, being the repositories of certain forms of strictly esoteric knowledge which the group regards as of transcendent worth, they gradually assume a position of great power and importance. Freed from the more immediate demands of life and endowed with leisure, they are enabled to devote their energies to the further development of this valued heritage.

It is probably at this point that the first true schools appeared. Since the priestly knowledge must be passed on with great thoroughness and precision, the need for a period of prolonged and systematic training is apparent. Among the primitive peoples this training process may never go beyond a crude form of apprenticeship, but with the invention of writing and the accumulation of precious records more efficient and reliable methods of tuition become necessary. The origin of a special institution devoted exclusively to the work of education is lost in mystery. Probably, however, this event occurred some four or five thousand years ago in one of those early civilizations which developed between the Mediterranean and the Yellow Sea.

Possibly Egypt led the way in the organization of formal education. During the period of the Old Kingdom (2980–2475 B.C.) schools of some kind evidently existed, attached to the palace and serving not only the sons of the king but also the boys of the wealthy classes. Here pupils received instruction in the art of writing, ethical precepts, practical philosophy and good manners; also in gymnastics and swimming. At a later date, to meet the need for a trained personnel to administer the affairs of the state, numerous instruction houses, as they were called, were established. Boys from the middle classes attended these institutions and served a sort of apprenticeship under appropriate higher officials chosen for the work.

The Chinese system of education, which rivals the Egyptian in age, has been traced back to the twenty-third century B.C. Very little, however, is known about it during the first seventeen or eighteen centuries of its existence. It was after the time of Confucius (551–478 B.C.) that the system took form which persisted with but little change down to the close of the nineteenth century. The major object of this system, which consisted of an elaborate network of schools of lower and higher grade and state conducted examinations, was the selection of candidates for every office of public trust from that of elementary school teacher to that of member of the emperor's cabinet. The subjects of study were the *Four Books* and the *Five Classics*, the sacred literature of China written by Confucius and his disciples. The pupil was expected to memorize the content and imitate the form of these literary masterpieces. No deviation from the patterns set by the past and no originality in style were tolerated. For century after century the principle of conformity was enforced upon a vast population. Although the schools reached directly but the smallest fraction of the people and although their methods were extremely crude, their influence was felt throughout the length and breadth of society. To this systematic use of the means of formal education for the prevention of social change history offers no parallel.

If China was ruled for many centuries by scholars, India was ruled for a period of almost equal length by priests. During the Brahmanic era, which dates from about the sixth century B.C. to the thirteenth century A.D., the Brahmins—the priests, teachers and lawgivers of the country—fixed the limits of knowledge and the extent of educational opportunity for the

lower castes: the warriors, the merchants and husbandmen, and the artisans and laborers. The outcasts, an order of persons not recognized by the Brahmanic system, possessed no educational rights or privileges of any kind. Two types of schools, reflecting this stratification of Hindu society, were organized: the Sanskrit school and the village school. The former was literary and philosophical in emphasis, was designed for members of the priestly order but was open to the more favored representatives of the lower castes. Its curriculum consisted of the sacred Vedic literature supplemented by heroic secular poems and the science of the age. In the course of time, however, this institution became differentiated into separate schools of literature, law, astronomy and medicine. The village school was eminently practical in purpose and was conducted for the sons of small landowners, gardeners and traders and therefore reached a much larger number of persons. It consisted merely of a class of boys from five to ten or twelve years of age assembled about a teacher in any convenient place. The subjects of study were reading, writing, arithmetic, money, weights, measures and simple accounts; and the instruction was conducted in the vernacular. The Brahmins also exercised a profound influence over all ranks of Hindu society through the all pervading religious ceremonials.

The Jews represent yet another tendency among the early civilizations. Although they were to a peculiar degree a religious people they were somewhat slow in the establishment of schools. This was apparently due in part to the persistence of a simple tribal culture rather than to a lack of interest in education, in part to the non-speculative and largely behavioristic nature of Jewish religion at the time. The exaltation of the family and parental responsibility was no doubt another important factor. In Biblical times the Jewish child had direct experience with the annual festivals and religious ceremonials. The father played the role of interpreter and counselor and was expected to exercise general supervision over the moral and religious training of his children. The educational ideals of this early period may be found in the book of *Proverbs*, which was written about the year 1000 B.C. Following the return of Ezra in 458 B.C. synagogues were established in which the sacred writings were studied and expounded. Under the influence of the scribes these institutions gradually developed into centers of instruction for those interested in the

law. About 70 B.C. definite schools for orphans were founded, and a century later a decree was promulgated requiring the establishment of elementary schools for all children from the age of six. Each community was expected to provide a teacher for every twenty-five children. The program of instruction, however, seems to have been much the same as that of the family. The emphasis was strongly religious and the subject matter was Holy Scripture. The further distinctive development of Jewish education was cut short by the spread of Greek and Roman influence.

The contribution of the Greeks and particularly of the Athenians to the theory and practise of education can scarcely be overstated. They freed the individual from the domination of the group, encouraged the development of personal character, formulated the ideal of a liberal education and for the first time in history endeavored to bring into harmony the intellectual, moral and aesthetic aspects of life. Some enthusiasts would even argue that the intervening centuries have witnessed no important advances outside the realm of the conquest of material things. Yet among these Greeks the position of woman was inferior and degrading, and the great majority of the people were slaves.

During the Homeric period the Greeks were emerging from barbarism into civilization. The methods of education were consequently similar to those found among the primitive peoples today. With the appearance of the city-state as the dominant social institution education assumed definite forms which varied from state to state. The contrast between Sparta and Athens, the two leading states, is peculiarly illuminating.

The essential features of the Spartan system of education, which persisted with but little modification until the Macedonian conquest in 338 B.C., are supposed to have been outlined by Lycurgus in the ninth century B.C. The central purpose of this system was to produce the ideal citizen and soldier—obedient, loyal, truthful, courageous. The general conduct of education was placed in the hands of state officials and the whole of life was organized with a view to the training of the young. Every Spartan adult was a teacher and every Spartan child had a tutor. The girl received the same attention and much the same kind of education as the boy.

During his first seven years the boy was under the direct care of his mother. He then went to

the public barracks to live at state expense. There under the guidance of his elders he engaged in a great variety of gymnastic exercises and sports—running, leaping, boxing, wrestling, hunting, discus throwing, javelin casting, choral dancing and military drill. Reading, writing and music were a purely incidental part of his education. From eighteen to twenty he devoted himself to the serious study of arms and military science. Thereafter for ten years he lived the life of a soldier in the army. At thirty he attained the full status of citizenship and the privilege of marriage.

In Athens the major responsibility for the education of the young was placed on the family. There were no public schools. The state made direct provision only for the military training of young men between the ages of sixteen and twenty. Through the Court of the Areopagus, however, which had special charge of the morals of youth, the state was able to exercise an indirect control over the work of parents and private schools.

As in Sparta the formal education of the boy began at seven years. If the family could afford it, his schooling continued until fifteen or sixteen, when the period of childhood terminated. He attended two schools alternately—the music school and the palaestra, or the gymnastic school. The former seems to have received its name from the fact that its curriculum consisted originally of music and poetry. Later drama, history, oratory and science were added; and about 600 B.C. reading and writing were introduced. The palaestra was devoted to games, gymnastics and physical contests of various kinds. Through dancing the spirit of the two schools was united.

At sixteen the boy discontinued all literary and musical study and entered the gymnasium—a state institution—where he remained two years. Here, while still under the control of parent or guardian, through physical contests, political discussion and free association with his elders he was prepared for the duties of adulthood. At eighteen he became a citizen cadet and for two years a ward of the state. Then at twenty years of age, having successfully passed various tests, he was admitted to full citizenship.

After the age of Pericles profound economic, political and social changes widened the intellectual horizons and created on an unprecedented scale opportunities for individual advancement. As a consequence the love of ease

and comfort grew, the old loyalties weakened and the sense of social obligation atrophied. The entire program of education was affected. In the music school literary study increased, grammar and rhetoric were emphasized and new musical instruments were introduced. In the palaestra the severity of the physical exercises was relaxed. Everywhere education became more intellectual, and instruction took the place of training. To prepare the individual for success under the changed conditions a new class of teachers, the sophists, appeared in the land. These men professed knowledge in all fields and gave instruction in dialectic, discourse and public speech. In their hands education hastened the process of social disintegration.

The question of the reconciliation of the interests of the individual and society became acute. Educational theorists arose who sought a non-traditional basis for morality. Socrates arrived at the fundamental principle that "knowledge is virtue" and perfected a method of questioning by which the individual could arrive at knowledge through the critical examination of his own experience. The development of the power of thought rather than the acquisition of information was to him the goal of education. Plato in the *Republic* drew the outlines of an ideal state in which the citizens were divided into three classes: the philosophers, who governed the state; the soldiers, who defended it; and the farmers, artisans and business men, who produced its wealth. The members of these classes were both trained and selected by an elaborate system of education. Since his inquiry into the nature of knowledge had led Plato to the conclusion that reality lay in ideas, their conception dominated his educational program. Aristotle emphasized the functioning of ideas in practical life and formulated the inductive method as the only reliable source of knowledge. Moreover, he made happiness or goodness rather than knowledge the end of education and the basis for the reconciliation of individual and society. The work of these great theorists, however, seemed to have had but little effect on the course of events: the forces of change were too powerful to be thwarted; the individualistic tendency triumphed; education became a means of promoting personal advancement.

Following the conquests of Alexander Greek culture spread throughout the empire and in time became a universal culture. This resulted in further changes in educational institutions. Out of the work of the sophists came two dis-

tinct types of schools: the rhetorical and the philosophical. The first trained for the practical activities of the intellectual class; the second centered attention on argumentation and philosophical speculation. Illustrative of the latter were the academy of Plato and the lyceum of Aristotle. Other philosophers, such as Zeno and Epicurus, also gathered students about themselves and established schools of great influence. Gradually these institutions abandoned the independent search for knowledge and devoted themselves to the formal elaboration and propagation of the thought of their founders. Finally, out of the rhetorical and philosophical schools grew great universities, like those of Athens and Alexandria, in which famous scholars labored and learning in many fields was cultivated. Thus ancient Greece seems to have developed the basic educational institutions found in the modern world.

The Romans were far less prolific in the realm of education than the Greeks. Essentially a practical people, little given to speculation and intellectual cultivation, they were interested in the conquest of the material world. They were soldiers, administrators, statesmen. In the rearing of their children they consequently emphasized character formation and the homely virtues of piety, modesty, courage, fortitude, prudence, honesty and trustworthiness. The concept of duty pervaded their program of education.

During the period of early Roman education, which embraced the five centuries following the founding of the city in 753 B.C. and which preceded the coming of Greek influences, the processes of education were carried on without the help of special agencies. The major responsibility was borne by the family. Both father and mother directed the education of the child. By means of an informal but rigorous system of apprenticeship which brought the child into contact with real life, rather than through gymnastics, sports, music and literature, the individual was prepared to discharge the various duties of the Roman citizen. Every boy was expected to learn by heart the laws of the Twelve Tables, not for the purpose of awakening the mind but to provide a guide to conduct. Toward the close of the period a few private and relatively unimportant elementary schools for teaching the rudiments of reading, writing and arithmetic began to appear.

As Rome extended her influence over the Italian peninsula in the third century B.C. the old educational system felt the impact of new

forces. The elementary schools increased in number and importance. Their curriculum became more literary. The *Odyssey* was translated into Latin and introduced into the program of study. Greek teachers came to Rome, often as slaves, and founded Greek grammatical and rhetorical schools. Roman youths were sent to Greece to finish their education.

With the founding of the empire during the first century B.C. the appropriation of Greek culture proceeded more thoroughly and systematically. The elementary school took on the character of a preparatory institution for the imported grammar school, which became definitely organized, received public support and assumed two forms, the one teaching Greek and the other Latin. The latter spread throughout the cities of the empire, carrying not only the Latin language but also Roman history, science, literature and in time even music, mathematics and dialectics. After completing the grammar school at fifteen the Roman boy entered the rhetorical school and continued his preparation for public life. Here he studied the theory and practise of oratory and in addition music, arithmetic, geometry, astronomy and philosophy. The object of this training was to produce the orator, the man capable by reason of his knowledge, grace and ability as a speaker of occupying and holding positions of leadership in a society lacking newspapers and printing presses. Quintilian in his *De institutione oratoria* gives the Roman conception of the nature of oratory and at the same time presents the first systematic and comprehensive treatise on education ever written.

Other phases of Greek education were also introduced. Libraries were brought to Italy by Roman conquerors as a part of the spoils of war. One of these libraries, which was established in Rome by Vespasian, developed into the Athenaeum under Hadrian and eventually into the University of Rome. Here were taught Latin, Greek, philosophy, law, medicine and even architecture, mathematics and mechanics. This direction of the university to the service of practical ends is entirely characteristic of the Roman influence.

With the decay of Roman society, the establishment of the absolute monarchy and the reduction of the liberty of the individual citizen the social foundations of this educational system were gradually undermined. As a consequence by the end of the third or the beginning of the fourth century the schools began to lose their

vitality and to become formalized. At the same time a powerful revolutionary force had appeared in the Mediterranean world; through a series of decrees following the conversion of the emperor Constantine in 312 A.D. Christianity was made the official religion of the Roman Empire.

The rapid spread of the Christian church throughout the Roman world during the fourth and fifth and among the Germanic tribes during the sixth and seventh centuries represented a political rather than a spiritual conquest. The task of Christianizing vast populations, pagan and barbarian, still remained. This required, on the one hand, the philosophical elaboration of the simple doctrines of Jesus and, on the other, the conversion of the masses to a new way of living. The first need was met by the work of the early Christian fathers who had been trained in the schools and universities of Greece and Rome; the second, by the various ceremonies and institutions of the church operating over a period of a thousand years.

In the Mediterranean basin the church gradually took over many of the old Roman schools and directed them to the development and propagation of Christian doctrine. In these schools and in others specially founded for the purpose the leaders of the new religion were prepared to meet the attacks of Greek philosophers. Also special schools, known as catechumenal and catechetical schools, were organized to instruct converts in the articles of faith. In time these institutions developed into episcopal or cathedral schools and became a definite part of the ecclesiastical organization: each bishop founded a school for the training of his clergy and after the fifth and sixth centuries for the preparation of boys for the priesthood. Since only these schools and those associated with the monasteries survived the triumph of the barbarians in the West, education reverted to a more primitive level.

The schools established by the various monastic orders for the purpose of training novices were the most important and numerous schools of the Middle Ages. The education provided, however, was primarily moral and disciplinary rather than literary and intellectual. Dedicated to the service of the church, the orders were founded on asceticism; yet the monastery was a center of learning in an age when things of the mind were not prized. The monks collected books, copied manuscripts, wrote chronicles and practically monopolized the production of

literature down to the eleventh century. They also organized the knowledge of the time into the seven liberal arts: the trivium, including grammar, rhetoric and dialectic; and the quadrivium, embracing arithmetic, geometry, music and astronomy.

In the eleventh and twelfth centuries a marked revival of intellectual interest followed the breaking down of mediaeval isolation, the establishment of contacts with the civilizations of the East and the general growth of culture in the West. This revival took the form of scholasticism and generated a movement which dominated the cultural life of Europe until the fifteenth century. Its controlling purpose was to found faith upon reason and combat various heretical views which were creeping into the church. To the task came men of great talents, such as Albertus Magnus (1193-1280), Thomas Aquinas (1225-1274), John Duns Scotus (1271-1308) and William of Ockham (1280-1347). The philosophy of Aristotle was rediscovered and vigorous controversies were waged. Although the subjects of disputation were the doctrines of the church and the methods were highly formal, scholasticism nevertheless represented a movement of great power and significance. It set forces in motion which were destined to overthrow the orthodoxies of the mediaeval world.

The most important product of scholasticism was the establishment of new types of schools. It was in the reign of the schoolmen, as the leaders of the movement were called, that the first universities were founded: the University of Bologna in 1158 and the University of Paris in 1180. During the next century, the thirteenth, nineteen more were founded; during the fourteenth, twenty-five; and during the fifteenth, thirty. By 1600 there were 108 universities in Europe. Since these institutions were given special privileges and a considerable measure of freedom they rapidly became centers of great influence. Young men from many countries mingled together and engaged in the study of the arts, medicine, law and theology—the four faculties, or divisions of knowledge, into which instruction was organized. Latin was the language of the university as it was of the church and constituted approximately the only prerequisite of attendance. Because of the scarcity of books the instructor employed the lecture method and gave opportunity for disputation. Although the university reflected in its structure and its practises the life of the age it fostered

the spirit of inquiry and laid the foundations of European scholarship. Out of it came the heralds and the architects of the modern world—Dante, Petrarch, Wycliffe, Huss, Luther, Calvin, Copernicus, Galileo, Newton.

Because of the position of Latin in church and university the later Middle Ages witnessed the growth of a variety of Latin schools. To the schools of earlier origin—episcopal, cathedral and monastic—were added at this time schools established by various guilds, schools maintained by private endowment and schools connected with almshouses and other institutions for poor relief. The function of these grammar schools was to prepare young boys for the church and the university. By the sixteenth century they were found in most of the towns and cities of the countries of the West. With the passing of the feudal order they gradually came to constitute the system of secondary education which, combined with the university, was to provide the opportunities of formal education for the ruling classes of Europe for more than three hundred years.

At the same time certain social changes were taking place which eventually fashioned a school for the masses. Between the twelfth and the sixteenth century with the growth of commerce and the establishment of self-governing cities a new class appeared, composed of craftsmen and merchants. Since the members of this class had no interest in Latin and since their occupations rested increasingly on reading, writing and arithmetic, a demand arose for the organization of schools to teach these subjects in the vernacular. Such institutions seem to have appeared in certain cities as early as the thirteenth century, although even at the close of the Middle Ages they were almost entirely absent in the villages and rural districts. They represented the beginnings of that system of elementary education which was to serve the masses of the people in every western state a few centuries later.

The burden of education during the Middle Ages was borne by non-scholastic agencies. The rites, ceremonials and services of the church were powerful factors in the sphere of religion and morals. The practical training of the masses was acquired for the most part in the home and on the land. With the development of the guilds a definite system of apprenticeship was organized for the preparation of the craftsman. For the nobility an interesting and elaborate scheme of education took form. From his sev-

enth to his fourteenth year the boy served as a page, performing various simple tasks about the castle, such as attending the ladies and waiting upon the table. At fourteen he became a squire and was attached to some knight, for whom he performed personal services and acted as special attendant in the tournament and on the battlefield. All the while he was supposed to be learning "the rudiments of love, of war, and of religion." At the age of twenty-one, after observing a number of religious ceremonies, he received the badge of knighthood.

In other parts of the world during this period—in China, in India, in Asia Minor—important developments were taking place in learning and education. Under the patronage of the Saracen courts beginning with the eighth century the study of Greek philosophy, which had been suppressed by the Eastern church in the sixth century, was fostered. Mathematics, natural science and medicine also flourished. From such important centers of culture as Bagdad, Basra and Kufa the movement spread to Spain and took form in the famous school of Cordova. Everywhere the Saracens established libraries, universities and institutions for the instruction of children. They promoted the study of geography, algebra, advanced arithmetic, medicine, surgery, pharmacy and physiology and made significant and original contributions to knowledge in all of these disciplines. In the twelfth century, however, a reaction set in and Mohammedan culture entered a period of stagnation and decline. At the same time Christendom came into possession of Saracen learning and entered upon a period of rapid progress.

These various influences—the growth of commerce and industry, the founding of the universities, the establishment of contacts with the culture of the East and the rediscovery of the literature of the ancient world—combined to transform the social system and to destroy the intellectual foundations of the Middle Ages. Men revolted against authority in all of its forms; they craved a richer, fuller and broader life; they yearned to explore the realms of art and nature. And they found in the literature of the ancient Greeks and Romans evidence that at one time men had so lived. Originating in Italy, the intellectual center of the period, the revolt gradually moved north and west and profoundly affected every phase of life.

The Renaissance altered both the purpose and the content of education. Particularly in Italy it shifted attention from the world of spirit

to the world of sense; it defined the goals of life in terms of the development of a free moral personality; it revived the conception of a liberal education as developed by the Greeks. Paulus Vergerius, an educator of the period, thus formulated the new point of view: "We call those studies liberal which are worthy of a freeman; those studies by which we attain and practise virtue and wisdom; that education which calls forth, trains and develops those highest gifts of body and of mind, which ennoble men and which are rightly judged to rank next in dignity to virtue only." The fact that the classical languages and literatures became the vehicle of this humanistic education was in a sense a historical accident. They were but the keys which unlocked the doors to the rich cultures of the past, and yet with the passage of time humanism became identified with the particular forms in which it first was clothed. By the end of the sixteenth century a knowledge of Latin grammar and syntax was substituted for an acquaintance with the culture of the ancient world and a severe discipline of the mind became the goal of education.

The effect of the Renaissance on the organization and conduct of education was pronounced. In the universities Greek language and Greek literature were added to the curriculum, classical Latin was substituted for ecclesiastical Latin, and the general tone of the institution was liberalized. But it was at the level of secondary education that the most significant changes occurred. Here a struggle for control developed between secular and church authorities. In Italy and to some extent in Germany under the influence of court and nobility schools were established in which the ideas of chivalry and humanism were fused. More important in the Teutonic countries, however, was the founding of the *Gymnasium*, which has prevailed down to the present time as the most characteristic form of secondary education. This institution was created during the latter part of the fifteenth century by the transformation of church and burgher schools already existing. The type was set very largely by the *Gymnasium* organized in Strasbourg by Johann Sturm (1507–1589) in 1537. In England the movement took the form of the great public schools, such as Winchester, founded in 1379, Eton in 1440 and St. Paul's in 1512, which have trained British leaders for centuries. In the establishment of the Latin grammar school in Boston in 1635 the influence of the Renaissance reached

America; but by this time the ecclesiastical tradition had triumphed over the liberal vision of the early humanists.

In the north and west of Europe the Renaissance was closely related to, if not identified with, the Protestant Reformation. This movement, which was also a protest against the authority of the mediaeval church and which had its roots far back in the past, reached its fruition in the sixteenth century under the leadership of Martin Luther and John Calvin. According to the Protestant theory the road to individual salvation lies through a direct appeal to God rather than through the mediation of the church. And since the Divine Will was supposed to be revealed to man in its clearest form in the Holy Scriptures, the ability to read the Bible became necessary to salvation. The Protestant Reformation thus laid the foundation for the organization of universal elementary education in the vernacular.

The establishment of a system of universal elementary education, however, was not the immediate result of the Reformation. The first concern of the Protestant leaders was the winning of the struggle. The fact that the art of printing had just been developed greatly affected the situation. The struggle among the rival sects was carried on through books and brochures, as well as by means of the sword. The pamphlet is said to have been originated by the reformers as a cheap and convenient method of reaching the people. In the press society found a new educational agency, which has continued to gain in power with the passing of the centuries. But neither in England nor in Germany was there any great increase in the provisions for elementary schools. Only in Puritan Massachusetts was the logic of the Protestant position applied. There as early as 1647 the General Court required all towns of a certain size to establish and maintain reading schools. When the Protestants finally did organize primary instruction they were less interested in preparing their children to read than in thoroughly indoctrinating them in the tenets of the new faith. The Reformation therefore increased for at least a time the grip of the clergy and the church upon the schools.

This conclusion is reinforced by a reference to the Counter-Reformation. The Catholic church quickly took the offensive in the struggle. The methods of education and propaganda which the Protestants had proved effective were adopted. Various teaching orders were founded

whose members rapidly took over the educational functions of the church. The most powerful of these organizations was the Society of Jesus, which was organized in 1540 by Ignatius de Loyola. Since the major interest of the Jesuits was the education of leaders, they devoted their energies to the promotion of secondary and higher education. This they did with great energy and efficiency. They gave close attention to administration and supervision, upheld a stern and rigorous discipline, provided for a thorough training of teachers and recognized the importance of method. The teaching orders controlled secondary, higher and a large part of elementary education in the Roman Catholic countries of Europe until the end of the eighteenth century.

With the coming of the modern age formal education assumed a significance far in excess of anything that the world had yet seen. The school, which had been a minor social agency in most of the societies of the past, directly affecting the lives of but a small fraction of the population, expanded horizontally and vertically until it took its place along with the state, the church, the family and property as one of society's most powerful institutions. Moreover, the processes of education became the subject of increasingly careful and intensive study, and elaborate programs for the training of teachers were developed. At the same time the educational responsibilities of old institutions like the home, the church and industry weakened, while certain new institutions endowed with large educational possibilities, such as the press, the cinema and the radio, appeared and prospered. The great changes of this period may best be outlined under the heads of nationalism, democracy, industrial civilization, social revolution and the theory and science of education.

The development of the strong national state with populations united by a common cultural tradition and the sentiment of patriotism challenged the power of the church in the realm of temporal affairs. From the sixteenth century onward the former grew at the expense of the latter. As a consequence the state gradually took over responsibility for the organization and conduct of formal education. This change of course progressed at different rates in different countries.

Although the English were perhaps the first people to manifest the characteristics of nationalism they did not establish a national system of schools before the middle of the nineteenth

century. It was Prussia, under the despotic but benevolent rule of the house of Hohenzollern, that led the way in making education a function of the state. Throughout the eighteenth century the Prussian kings displayed an active interest in the question of education and encouraged experimentation. During this period also a powerful philanthropic movement, devoted to the improvement of the conditions of the masses by means of education, spread through Germany, England, France and other countries. In 1794 the agitation and decrees of practically a hundred years culminated in the publication of the *Allgemeine Landrecht*, the fundamental code of the Prussian law, in which schools and universities were defined as state institutions. In the United States the battle for free state schools was fought in the second quarter of the nineteenth century.

The transfer of the school from the church to the state had profound effects on the conduct and substance of education. The purpose of education underwent fundamental transformation. Whereas the church had sought to make good communicants and save souls, the state was interested in making good citizens and promoting the national welfare. To be sure, the conception of what constituted good citizenship or national welfare varied greatly from country to country and reflected the interests of the ruling class or group. Nevertheless, there was a general shift of purpose, which was revealed particularly in changes in the curriculum. Under the domination of the church practically everything taught in the school, from the alphabet to science, carried a strong religious flavor. The state introduced a secular bias, widened the program of instruction, emphasized the teaching of patriotism and exalted the national culture. Moreover, while administrative control ranged from the highly centralized systems of France and Prussia to the extreme localism of England and certain American communities, the assumption of responsibility by the state undoubtedly resulted in the wider extension of educational opportunity and the more systematic organization of schools. During the nineteenth century compulsory schooling for children between the ages of six or seven and thirteen or fourteen became general among the more advanced nations of the world.

Democracy is another force which has left its impress on the schools. Although there is much disagreement about the nature of democracy as an ideal, historically it has assumed two

forms which have greatly affected education. In its political manifestation democracy involves the extension of the right of suffrage to the masses. In democratic countries one of the most powerful reasons advanced in favor of the establishment of free schools is the argument that the responsible citizen must be informed and that in order to be informed he must know how to read. It is interesting to note, however, that the more enlightened monarchs have also favored the abolition of illiteracy. Undoubtedly the ability to read may merely make the individual citizen more subject to propaganda and a willing tool in the hands of some ruling caste. Universal literacy greatly widens the possible range of mob behavior.

A second manifestation of democracy which has influenced the school is the ideal of equality of opportunity. Practically throughout history the privileges of formal education have been limited to a small part of the population, to the favored social classes. Even with the rise of the great state systems of education in the nineteenth century a dual organization of schools was commonly adopted. The one half of the system, providing a meager education and composed of the elementary school only, was designed for the masses; while the other, comprising a rich and extended program of secondary and higher education, was open to the children of the aristocracy. In its primitive stages this dual system was brought to the American continent by the early colonists, but it was unable to survive the democratic conditions generated by a pioneering economy. During the seventeenth century the private academy replaced the Latin grammar school and opened up a variety of opportunities for the middle classes. Then in 1821 there was established in Boston the first public high school. This institution represented an upward extension of elementary education and spread rapidly through the country. During the next thirty years the development in the American Middle West of the state university completed the educational ladder and established a single system of free public schools open alike to all classes of the population. Since the beginning of the twentieth century and particularly since 1918 this organization of education, with certain modifications, has spread to many other countries.

Industrial civilization, although still in its early stages, has already transformed the institutions of education. This new civilization of science, technology and machinery which has

taken form in the west of Europe and in America during the last century and a half and which now unites the whole world into a single great society is marked by rapid change, close integration, extreme differentiation and most extraordinary power; it has greatly widened the interests, the responsibilities and the opportunities of men. The small self-sufficient community is rapidly making way for an order of greater scope and complexity. In the preparation of the individual for even the more common activities of life the simple methods of apprenticeship are no longer adequate. As a consequence the curriculum of the school has been greatly extended. The so-called modern disciplines—mathematics, natural science, modern language and literature, history and social science—have been added to the program of studies in the secondary and higher schools. And following these have come the distinctly practical subjects, such as agriculture, commerce, technology and the industrial, household, aesthetic and recreational arts. The founding of trade schools, technical institutes, engineering colleges and great research laboratories during the nineteenth and twentieth centuries may be traced to the rise of industrial civilization.

Along with the extension of the curriculum has gone a great expansion of formal education. The school, in the form of kindergartens, crèches and nursery schools, is extending itself downward to embrace the early years of childhood and even of infancy. This institution is also reaching upward into the years of adult life. The dynamic quality of industrial civilization is making of education a lifelong process. But perhaps the most striking response of the school to new culture is found in the growth of secondary and higher education. Thus in 1890 there were probably not more than 300,000 boys and girls, or less than 6 percent of children of appropriate age, attending the secondary schools in the United States. By 1930 this number had increased to approximately 5,000,000 and embraced at least one half of the children of appropriate age. More recently the colleges and universities have been growing in similar fashion. Apparently the same forces are operating in other countries as man's conquest of nature increases the economic surplus, lengthens the span of life and makes possible the prolonging of the period of childhood and youth.

The non-scholastic education of the child has also been greatly affected. The family and

small community, the major educational institutions in practically all societies of the past, have both been greatly weakened. The same may be said of the church. On the other hand, certain institutions of great power have either appeared or grown rapidly during recent times. The press although continuing to evolve has already become a factor of enormous influence in social life. The cinema, the radio and travel are still in their youth, but their educational possibilities are clearly manifest. One of the major cultural tasks of the immediate future is the direction of these new agencies to socially desirable ends. The importance of this problem seems to be most fully recognized in Germany, the Soviet Union and some of the smaller countries of Europe.

As industrial civilization spreads over the world it seems destined to influence educational theory and practise everywhere. The great nations of the West, in their search for markets and raw materials, have imposed themselves and their institutions on the industrially retarded peoples of the earth. Thus the English have gone into India, the French into Indo-China, the Dutch into Java, the Americans into the Philippine Islands. In each case the conquering people has sought to carry its educational system, at least in part, to the conquered. On the other hand, the Japanese scrapped their antiquated educational institutions in 1872 and introduced a new system based upon European ideas. At first they followed French leadership, but in 1886 reorganized their program somewhat after the German pattern. In 1905 the Chinese experimented with the new Japanese program only to abandon it seven years later in favor of an arrangement more like that developed in the United States. Throughout the world old educational institutions give way to science and the machine.

The war of 1914-18 precipitated a series of social and political revolutions of profound significance for education. The outstanding event of the period was the great convulsion which overthrew the rule of the Russian czar in 1917 and under the leadership of Lenin proceeded to the construction of a socialistic state. Here for the first time in history formal education is being used on a grand scale in the building of a new order. Practically all of the cultural institutions of society except the family and the church have been forged into a single instrument and made to serve the one great purpose. The Soviet educational system there-

fore includes not only one system of schools for the younger generation and another for adults but also the press, the library, the bookstore, the museum, the art gallery, the theater, the cinema, the radio, the excursion, the amusement park, the army and many other agencies. With the launching of the Five-Year Plan in 1928, a gigantic program for the industrialization of the country, the collectivization of agriculture and the general development of the cultural life of the people, this vast system of education has been assigned a concrete and definite task of enormous magnitude. It is being asked to change the very character of a population of about 160,000,000 persons and to compress within the limits of a single generation the evolutionary processes of a century and a half.

The modern age, like the ages that went before, has had its educational theorists—men who have devoted their lives to the study of the educative process, the nature of the child and the work of the school. John Amos Comenius advocated the complete development of man as a rational creature, outlined a comprehensive plan for the organization of education from birth to maturity, championed gentleness and kindness in the discipline of children and greatly advanced the writing of textbooks. A generation later John Locke contended that learning from books is less important than virtue, wisdom and breeding; that the aims of the school should be secular rather than religious in nature; that the development of “a sound mind in a sound body” should be the dominant purpose of education; and that methods of instruction should be based upon the natural activities of the child. Jean Jacques Rousseau, following in the footsteps of Locke, vigorously attacked artificiality and formalism in education as well as in life; advocated a return to nature in the realms of education, family, politics, religion and art; wrote the most influential book (*Émile*) on education published during modern times; argued that man is good by nature and degraded by social institutions; contended that the child should be treated as a child and not as a miniature adult; and outlined a general theory of education which emphasized motor activity, sense perception, natural interests, simple reasoning and the psychological rather than the logical method. Johannes Heinrich Pestalozzi, under the influence of Rousseau, sought “to psychologize education”; insisted that the child’s instincts and

capacities be respected; defined education as the “harmonious development of all the faculties”; advocated strict but loving discipline in the school; conceived of education as an instrument for improving the condition of the masses; and by precept and example argued that the correct methods of teaching should be discovered by experimentation. Johann Friedrich Herbart said that the “term *virtue* expresses the whole purpose of education”; pointed to the practical limitations placed on education by the nature of the child; made the development of many sided interests the aim of instruction; rejected the “faculty psychology” with the associated conception of education as formal discipline; argued for the importance of subject matter in the educative process; emphasized the humanistic aim of historical studies; developed the doctrine of apperception; and outlined a definite method to be followed in the acquisition of new knowledge. Friedrich Froebel, a close disciple of Pestalozzi, organized experimental and model schools; founded the first kindergarten; developed an elaborate system of symbolism for the instruction of young children; emphasized the importance of creative activity in play, art and domestic life; and contended that social training should be provided from infancy through cooperative games. Herbert Spencer attacked the formalisms of the English education of his day; contended that scientific knowledge is of most worth; defined the goal of education in terms of “complete living”; and made an analysis of the educational needs of society that has greatly influenced subsequent students of the school curriculum. John Dewey argues that the “primary business of the school is to train children in cooperative and mutually helpful living”; that the “primary root of all educative activity is in the instinctive, impulsive attitudes and activities of the child”; that interest and effort are not to be regarded as antagonistic; that industrial activities should be made the basis of the life of the school; and that education should involve the continual reconstruction of individual experience and social life. Under the leadership of William H. Kilpatrick and other educational thinkers in the United States and Europe the ideas of Dewey and certain of his predecessors have taken the form of a definite movement which in the United States has received the label of progressive education. The movement has already gained considerable strength in many schools and in time will no doubt affect the

conduct of the great state systems of education.

Closely associated with the development of educational thought just outlined is the movement for the scientific study of education. Pestalozzi in his insistence on the testing of method by experimentation and Herbart in his psychological studies both recognized the importance of applying the scientific method to the problems of education. In the realm of psychology this point of view received systematic development in the last century at the hands of Wilhelm Wundt, William James, G. Stanley Hall, Ivan Petrovich Pavlov, Ernst Meumann and many others. By the opening of the twentieth century objective and quantitative methods were being employed in the study of the learning process by such men as Charles H. Judd and E. L. Thorndike. At the same time the measurement of mental functions was being cultivated by Alfred Binet and J. M. Cattell, and the history of education by K. A. Schmid and Paul Monroe. Within a few years the movement spread to embrace every phase of education—administration, methods of instruction, curriculum making and the measurement of the results of teaching. Although this interest in scientific inquiry has fostered a mechanical conception of education, centered attention too exclusively on the school and the narrower aspects of tuition and resulted in the accumulation of vast quantities of sterile facts, the new method has already made important contributions to the theory and practise of education.

GEORGE S. COUNTS

PUBLIC EDUCATION. The question as to whether the family, the ecclesiastical authority or the state shall have control of the education of the child is no nearer settlement today than when it was first broached by Plato and Aristotle, who already had before them the *laissez faire* practise of the Athenians and the state controlled system of the Spartans. The universal tendency today is toward the provision of education by the public as represented by the state. State monopoly of education is still contested, however, by those who demand the right to educate their children as they please, mainly in private schools, and by religious bodies who claim that education belongs pre-eminently to the church. Thus the encyclical letter of Pope Pius XI in 1930 on the *Christian Education of Youth*, while recognizing the concern of the family and civil society in education,

states that the right of the church is "absolutely superior . . . to any other title in the national order." The Catholic point of view is in some countries shared by other denominations. Thus in England the Church of England, while accepting state aid for education, insists on the right to provide its own sectarian schools; in Holland public elementary schools are organized on a denominational basis; in Germany a new *Kulturkampf* was waged from 1925 to 1928 around the proposed *Reichsschulgesetz* which aimed to conserve denominational interests in elementary education. Nor has the question been permanently settled in France despite the law of 1904 in favor of a state system. In Russia all education has been laicized and private schools are tolerated only until public schools can be provided or to give vocational or technical training. Recent attempts in Italy and Mexico to withdraw schools from clerical supervision even for religious instruction have failed. The United States and several South American countries, notably Argentina and Uruguay, have definitely broken away from the traditional partnership with religious denominations and have adopted systems of public education under the supervision of public authorities. Yet even in these countries there exist private lay and denominational schools, generally under no public supervision whatever.

Little has been added to the theory underlying public education since Aristotle's discussion of the subject. "Of all things that I have mentioned," he wrote in the *Politics*, "that which contributes most to the permanence of constitutions is the adaptation of education to the form of government." Nearly two thousand years were to pass before these statements of the theory became problems of practical politics. Public education did not become a reality until the pressure of two modern forces—the rise of nationalism and the industrial revolution—produced conditions that demanded action.

The essential features of a system of public education are requirements of compulsory attendance, free tuition and provision of books and equality of educational opportunity "from the gutter to the university." Few of these ideals have been realized in most countries; free education is generally limited to elementary education, and equality of opportunity is provided in the United States only to the extent of the provision of free education in all branches. The additional proposal that free tuition should be supplemented by maintenance scholarships in

the leading countries of the world is still in the discussion stage. Compulsory attendance is, however, more nearly realized in most countries. Examples of compulsory education can be cited before the nineteenth century; it was to be found among the Spartans and the Jews; indirectly it was fostered during the Middle Ages in the oft repeated injunctions to parish priests to open schools. Compulsory education, however, is not synonymous with public education, but public education developed ultimately out of the movement for compulsory education stimulated by the Protestant Reformation in order to make the Bible accessible to the masses. Luther's recognition of the right of the state to enforce education as it did military service was put into practise in 1559 in Württemberg through the organization of a system of elementary, secondary and higher education. This practise was imitated in a number of other German states both Protestant and Catholic and culminated in 1642 in the establishment of a public system of education in Saxe-Gotha. Following the principle of *cujus regio, ejus religio*, education was placed under the combined supervision of state and church. According to Calvin education is a public necessity for all, "so that the Commonwealth may have some comfort by them" and the church be unharmed. Calvin's influence in education extended to Switzerland, parts of Germany, Scotland and New England, but while it spread the idea that the state had the right to enforce education in the interests both of state and church in only a limited sense did it lead to the establishment of public systems of education. Compulsory education lagged behind provision for education.

The modern movement for public education began with the French Revolution. The theorists of the period as exemplified by La Chalotais (*Essai d'éducation nationale*, Geneva 1763) urged that the child belongs to the state, which has both the right to enforce education and to provide schools in the interests of itself, of its citizens and of the nation as a whole. The purpose of education thus shifts from an emphasis on religious ends to one on national well-being. In 1791 Talleyrand drafted a bill for the organization of a public system of education aimed to make happier and more useful citizens through enlightenment. Condorcet in a bill presented in 1792 added a new note: education should also have the purpose of establishing equality of opportunity for the full

development of ability. Neither Talleyrand nor Condorcet contemplated the provision of equality of educational opportunity beyond the primary school. Their main interest lay in establishing that principle expressed by Napoleon in 1805: "Of all political questions, that (of education) is perhaps the most important. There cannot be a firmly established political state unless there is a teaching body with definitely recognized principles." A Napoleonic decree of 1808, supplemented under the Third Republic by the adoption of a system of lay education and the Law of Associations of 1904, has served as the foundation upon which the system of French education is built: the state alone has the right to provide, maintain and supervise education; non-public schools may be established only with the permission and approval of the government and must be open to government inspection.

So far as compulsory education is concerned, attempts during the French Revolution to compel parents to send their children to school or to make citizenship a privilege dependent upon a minimum of education failed. Guizot's law of 1833 requiring the provision of schools did not include compulsory attendance. Compulsory education did not become an issue in France until after 1850 and was finally enacted in 1882 through the efforts of Jules Ferry. This law, which is still unchanged, required attendance from six to thirteen; the enforcement of compulsory attendance, however, is notoriously defective.

The right of the state to enforce education was definitely asserted in Prussia in the *Allgemeines Landrecht* of 1794 and adopted later in other German states. The growth of political, military and economic nationalism served to strengthen this principle of state control. No departure was made from this principle until 1919; the section on education of the new German constitution provides thus: "Art, science, and instruction in them are free. The state guarantees their protection and participates in their promotion." The state thus retains its right to promote and supervise education, but a new spirit which encourages variety and flexibility has entered into the system. The constitution, however, carefully safeguards the establishment of private schools and in order to promote national solidarity prohibits them entirely during the first four years of compulsory education.

In Germany the practises begun during the

Reformation—compulsory provision of schools by localities or the imposition of compulsory attendance at schools, as in Weimar in 1619 and Saxe-Gotha in 1642—were continued with more or less success until the Prussian rulers used education as an instrument of state well-being and power. In 1717 Frederick William required parents under severe penalties to send their children to school. The General Country School Regulations of Prussia in 1763 required compulsory attendance from the fifth year "until the child is found to possess the knowledge necessary for every rational being," which in practise throughout Germany up to the present meant up to fourteen years of age. The average attendance usually reached 95 percent. The constitution of 1919 required compulsory attendance up to eighteen with full time attendance up to fourteen and imposed not merely compulsory education (*Unterrichtszwang*) but the compulsory school (*Schulzwang*) by compelling all children to attend the public *Grundschule* for the first four years of elementary education.

While France and, until 1919, Germany proceeded on the theory that the provision of education is the inherent right of the state, England has never looked kindly on it and has proceeded on the doctrine of *laissez faire* in education as in other aspects of social control. Although the state passed laws as early as the sixteenth century for the control of apprentices and pauper children, intervened through the law courts in the interpretation of educational endowments and through the Church of England regulated the licensing of teachers, it did not begin to participate actively in the provision or support of education until 1833. Education for the poor was provided by philanthropic organizations and for the rest in private fee paying schools, elementary and secondary. A few writers, such as William Godwin and Robert Owen, urged the provision of a public system of education by the state; but the rest of the country either was opposed to such a provision on the ground that education would make the lower classes restless and discontented or accepted the compromise suggested by Adam Smith and Malthus that the state might enforce compulsory education and might give financial support for schools for the poor, but that those who could afford it should pay for their own education. For the poor education must be provided to promote decency and order and to save them from delusions and super-

stitions. Adam Smith's plea for the provision of public education to secure decency and order was crystallized by Guizot in the epigram "every schoolhouse opened closes a jail," which was used for propaganda purposes in England and the United States as well as in France.

The *locus classicus* on the English position is to be found in J. S. Mill's *Essay on Liberty* (1859). Mill was not opposed to the provision of education by the state but believed it should be only one of a number of competing types and a model. A state system of education, he feared, would in time tend to mold all to one pattern intellectually. The extension of the franchise and the development of trade and commerce compelled the state to encourage and support the gradual expansion of the system of public education. The duty of seeing that children within the age limits of compulsory attendance are educated remains, however, with the parents, who may send them either to schools provided at public expense and inspected or to private schools which are in no way controlled or supervised by the state. The function of the state is to guide, encourage and advise the local authorities on whom falls the statutory responsibility of providing schools, and to assist financially not only public schools but others which furnish secondary and higher education and are not run for private profit.

Compulsory education was not introduced in England until 1876, when an act was passed which imposed on parents the duty of securing an efficient education for their children, abolishing child labor under ten and restricting child employment between ten and fourteen under certain scholastic conditions. The ages for employment and for exemptions for part time employment were later raised. Although in 1900 an act was passed permitting local authorities to require full time attendance up to fourteen, in 1914 there were still 70,000 children employed in part time work. The act of 1918 not only abolished the half time system and extended compulsory education to fourteen for all, but further provided that local authorities could raise the age limit to fifteen and by special permission of the Board of Education to sixteen. A report published in 1926 (England, Board of Education, *Report of the Consultative Committee on the Education of the Adolescent*) advocated the extension of the age limit for all to fifteen with the implication that some form of secondary education should be offered to all from about the age of eleven. A school attendance

bill to put these recommendations into effect was carried by the Labour party in the House of Commons but was defeated in the House of Lords in January, 1931. The average attendance attained in England is approximately 90 percent.

In the United States the movement for public education was based on arguments derived from eighteenth century French political philosophy. Two ideas dominated the advocates of a national system of education: faith in the perfectibility of man and belief that loyalty to republican ideals and democratic equality could be promoted only through a general and uniform system of education provided and maintained at public expense. Keen opposition was generally expressed to private schools. These ideas were inherent in the writings of Benjamin Rush on education (*A Plan for the Establishment of Public Schools* . . . , Philadelphia 1786), in the essays submitted in the competition conducted by the American Philosophical Society in the last decade of the eighteenth century and in the political philosophy of American statesmen. They found their way into the state constitutions framed in the early part of the nineteenth century. It took nearly three quarters of a century, however, to effect these ideals and to overcome such obstacles as opposition to taxation for free schools; the elimination of the charity school and the demands of sectarian schools for state aid; and the deep rooted tradition of localism, which was opposed to state control or supervision. Although American opinion in general looks with disfavor on private schools, they are not prohibited and exist in the interests of sectarian groups, of experimentation or of those who can afford to pay the fees. The attempt of one state, Oregon, to prohibit by law the establishment of private schools for elementary education was declared unconstitutional in 1925. Except for the right exercised in some states to enforce the attendance of pupils within the age limits for compulsory education, no provision exists for the control and supervision of private schools. Although Massachusetts laws of 1642 and 1647 imposed on towns of fifty householders the duty of providing a teacher and required parents to educate their children, the fight for compulsory education in the United States had to be undertaken anew after the War of Independence. The provision of public schools and of compulsory education came slowly through the efforts of philanthropic agencies, sectarian and secular, a

variety of education societies and the organized workers' groups and through the growth of cities and rapid spread of industry. The agitation for tax supported, non-sectarian, publicly controlled schools, free of tuition and compulsory, lasted during the first half of the nineteenth century. The first compulsory attendance law, requiring attendance for twelve weeks a year from eight to fourteen, was passed in 1852 in Massachusetts. Twenty-five states had followed the example of Massachusetts by 1889, but according to a report of the United States commissioner of education in 1890 the laws were inoperative except in Connecticut and Massachusetts. By 1914 all but six southern states had some provision for compulsory attendance and in 1920 Mississippi was the last state in the country to adopt such a measure. The effectiveness of the laws was for a long time nullified by the absence of satisfactory child labor laws and by provisions that school might be attended for a minimum period of weeks instead of the full time that schools were in session. A measure to enforce full session attendance was adopted in Connecticut in 1890.

At the present time, although the principle of compulsory education has been adopted throughout the country, the requirements vary considerably in such matters as ages of attendance, minimum length of school session and scholastic attainments required to obtain labor permits.

There is today a general tendency all over the world to require compulsory education up to the age of fourteen. This movement has received a strong stimulus from the international labor conventions held at Washington in 1919, Genoa in 1920 and Geneva in 1921, at which declarations were adopted against the employment of children under fourteen. In 1924 the Fifth Assembly of the League of Nations adopted the declaration of the rights of the child known as the Declaration of Geneva. A number of countries adopted this principle in their revised post-war constitutions, others in specific educational statutes. While the principle of compulsory education up to fourteen has been generally accepted, the enforcement of compulsory attendance lags far behind, partly because of post-war economic conditions, partly on account of an inadequate supply of schools for the extended program and to some extent as the result of the inertia of parents who have themselves had no education.

The program of public education was limited

AGE OF ATTENDANCE AND MINIMUM LENGTH OF

at first to the provision of elementary education for the masses and secondary education for the privileged classes or for the unusually able. A long fight had to be waged also before the idea of free education beyond the elementary school was adopted. In the United States it was not

until after the decision in the Kalamazoo Case in 1874 that taxes could legally be levied for the provision and support of high schools. The industrial revolution, the rapid expansion of trade and commerce and the development of the sciences led to the recognition not merely of the importance of more elementary education and of more differentiation of curricula in the secondary schools but also of the need of more diversified types of education better adapted to the demands of industrial society. This need became more insistent as the traditional systems of apprenticeship began to decline everywhere during the nineteenth century. The gradual universalization of elementary education in the leading cultural countries of the world in turn led to demands for more education. The most rapid progress in the development of public education has, however, taken place since 1918. To this have contributed not only national and economic needs but the spread of democratic forms of government, whose success is dependent on a literate public, and the recognition of the worth of the individual irrespective of the social class to which he may belong. There are thus found side by side world wide movements for the elimination of illiteracy among young and old, movements for the extension of equality of opportunity, which involves the provision of diversified forms of education adapted to the needs and abilities of the younger generation.

Another influence that has been contributed to this expansion is the recognition that education is a continuous process which begins with the birth of the child and persists throughout life. Accordingly, a system of public education is no longer limited to the provision of elementary and secondary education but consists of schools and institutions as varied as the needs of the individuals that make up a state: preschool and child care institutions; primary and secondary schools; special schools for physical and mental defectives; part time and full time vocational schools at different levels corresponding to the great variety of occupations; colleges and universities; professional schools; institutions for the preparation of teachers; adult schools and courses as diversified as are human interests.

The concept of public education is not limited, however, to the provision of schools for instruction only; it includes the provision of all those activities and organizations that will enable the pupils to derive the fullest benefit from

school work. These generally include provisions for medical inspection; medical treatment (legalized in England); meals in school with or without charge; school libraries; vacation schools and classes; school camps and excursions, as in England and Germany; colonies for physically defective children; and above all adequate playgrounds and athletic fields. To these should be added the organization of agencies for vocational guidance and employment of juveniles. If the complete realization of this combination of social services and education is not to be found in any one system of public education, the cause is to be found in the recent origin of this conception of the scope of public education. No country has yet gone so far as Russia in utilizing all possible educative influences and agencies both in and out of school for the preparation of its future citizens. Although extra-school activities, such as clubs, boy scouts and girl guides, are found everywhere they have not been incorporated in public school systems under the control of public authorities. In Russia, however, such youth organizations covering groups between the ages of seven and twenty-three as the Octobrists, the Pioneers and the Young Communists are recognized parts of the national machinery for training future members of the Communist party; in Italy the Balilla for boys from eight to eighteen is a recognized agency of the Fascist party receiving state aid.

In most countries the administration of education has been entrusted to a national ministry of education; in federated countries the practise varies. Thus in the United States there is no ministry but only the Office (formerly the Bureau) of Education in the Department of the Interior, whose primary function is to collect and distribute information on education but without any administrative authority; in Germany there is no federal ministry but there is a semi-official agency, the *Zentralinstitut für Erziehung und Unterricht*, which is mainly a center for information and research; in Switzerland there is no central organization of any kind; in Argentina the Ministry of Public Instruction administers secondary education but delegates the control over elementary education to the provinces; in Canada the Dominion Bureau of Statistics is limited merely to the collection and publication of educational statistics; while Australia does not possess an agency with even this limited duty. In the Union of South Africa the central department of education administers

in the main only higher and vocational education; the control of other forms of education is left to the provincial authorities.

The functions of ministries of education may be as broad as the whole range of the educational and cultural activities of a country or may be limited to the control and supervision of formal educational agencies. Under the first of these types may be included general supervision of fine arts, including theaters and moving pictures, and of scientific undertakings, as in France, Austria, Prussia, Czechoslovakia, Hungary, Denmark, the Irish Free State, Japan, Sweden and Turkey, with the addition in some countries of supervision over ecclesiastical affairs, as in Austria, Czechoslovakia, Norway, Hungary, Japan and Sweden. In general ministries of education are responsible for the administration and organization of education, for drafting and presenting the annual budget to parliament, for proposing legislation, for inspection, for consultation and advice on educational matters, for drafting curricula and courses of study, for examinations and for research.

The important problem in national educational administration, however, concerns not the functions of the central authority but rather the general question of policy or the extent to which direct control is exercised over the process of education and the degree to which local autonomy and private effort are encouraged. In some countries, probably the majority, control is not merely centralized but is bureaucratically conceived in the sense that everything that concerns education is carefully regulated, prescribed and supervised. On this question a dividing line cannot be drawn between countries on the basis of the form of government, whether monarchical or democratic. Thus France, the states of Australia, and Ontario in Canada represent the best examples of closely guarded centralization, while England and the United States represent the best examples of delegation of powers to local authorities.

The character of central control is governed rather by the theory generally accepted in a country of the relation of the state to education. A system of education may be divided in general into the *externa*, all those factors that are essential to make the classroom procedure possible, such as buildings and equipment, compulsory attendance, length of school year, qualifications and salaries of teachers; and the *interna* or the instruction proper, such as curricula, time schedules, courses of study and examina-

tions. The centralized administration tends to regulate and control both the *externa* and the *interna*, as in France; while in those systems in which the responsibility for the progress of education is delegated to local authorities under the inspection, advice and encouragement of the central administration the *externa* are prescribed and the *interna* are influenced by the publication of suggestions, reports and memoranda, as in England and Germany, where the individual school tends increasingly to become the center of initiative. In the first type the emphasis is on uniformity and standardization, in the other on freedom and responsibility as the bases for the advancement of national culture. Between the two, intermediate types may be found; thus in some countries, as in Uruguay and Argentina, there may be freedom in elementary education but prescription in secondary; or in others, as in Italy and Russia, there may be freedom in the development of curricula and courses of study only up to a certain point where the dominant political faith of the country is affected. In the United States the two main types may be found not only within each state but within the local areas to which the control of education is delegated by the state; the tendency seems to be, however, in the direction of greater freedom and flexibility. Bureaucratic administration of the *interna* is increasingly tempered by enlisting the cooperation of teachers.

The character of inspection is determined largely by the general type of control. In the centralized systems whether of a nation, state or city the function of inspection or supervision is to see that the regulations and detailed prescriptions are carried out; in the decentralized system, where prescription is reduced to a minimum, the purpose of inspection is to encourage, advise, discover and disseminate progressive ideas.

The degree of centralization may affect the official definition of the aims and purposes of education, particularly of the masses. Thus the official aim of elementary education in France is "to teach those things of which no adult should be ignorant," just as in pre-war Prussia the aim was "to train God-fearing, law-abiding, self-supporting subjects." The aim in Russia today is to produce socially useful revolutionary activists, in Italy citizens loyal to Fascism and in Japan loyal subjects of the emperor in accordance with the imperial rescript of 1896. In the decentralized systems the aim is more vague, with less direct emphasis on the social end and

more on the development of the individual. Thus the aim in England is character formation, in Germany development of personality "in the spirit of German nationalism and international conciliation," in the United States the training of individuals as intelligent citizens.

It follows from this distinction that educational progress tends to be slower in the centralized systems; thus the elementary school course of study in France remained virtually unchanged from 1887 to 1923 and in Prussia from 1872 until the post-war reorganization, while in England and the United States it has been constantly subject to change, particularly during the present century. New methods and changes in curricula and courses of study are discouraged in the centralized system, while in the decentralized they result in part in response to social changes and demands, in part from the free initiative of the teaching profession. But even in the second as much as in the first type, limits whether deliberate or unconscious are set to freedom in one field of instruction: the teaching of patriotism and nationalism. Here most countries emphasize, particularly in the elementary schools, propaganda and indoctrination through the teaching of history, civics and social studies. Even where a certain amount of professional freedom is tolerated in the choice of textbooks for other subjects, those in historical and civic subjects are under careful supervision and censorship. Thus in Russia and Italy, where teachers are permitted to frame the local courses of study and encouraged to use progressive methods, this freedom is limited in matters of political education, a condition which is also found in the United States. England and Germany are at present outstanding examples of greater freedom in these subjects, England perhaps because of the homogeneity of her population, Germany because of a sincere devotion on the part of a majority of the elementary school teachers to international conciliation. There is in this field of education considerable unrest among teachers even in France.

Secondary education is more governed by a traditional concept of its purpose in terms of culture or liberal education and preparation of leadership than is elementary education. Some differentiation has been introduced into the secondary courses of study since 1900, but further diversification may be expected as soon as the ideal of equality of educational opportunity becomes realized and a genuine attempt

is made to provide types of education and courses adapted to individual differences. Diversification has reached its culmination in the American high school. Such a change is inherent in the movement for universal secondary education; but European educational practise may be slow to accept the American secondary school system, which is based primarily on the concept of equality rather than on any basic educational principles.

It follows then that progress in education, including the introduction of new subjects and methods, demands a system which is flexible and in which freedom and initiative are encouraged for the spontaneous development of culture. This involves a sound and thorough preparation of teachers in an atmosphere that makes for professional growth rather than mere craftsmanship or skill, such as is often developed in centralized systems with fixed and definite educational aims; it demands participation, at any rate in the *interna*, by teachers' associations and faculties, as well as the intelligent cooperation of all groups interested in education, particularly of parents' organizations. The centralized system not only tends to keep under its control what is done in the school but excludes both teachers' organizations and parents from participation in the educative process; because it restricts the establishment of private schools it also limits the opportunity for experimentation. The decentralized system because it regards variety as the essential basis of cultural progress encourages experimentation not only by leaving a free field open for private schools, as in England, the United States and Germany (after the first four years), but also within the public school system itself. There is always present, however, a certain inertia among teachers themselves and among parents, which can be overcome in the first instance by placing the preparation of teachers on a professional rather than an apprenticeship basis, as is being done in Germany, England and increasingly in the United States, and in the second by the education of parents through parent-teacher associations, which have developed generally in the last two decades.

The real problems today, granted the right of the state to provide a system of education, are whether the state shall have a monopoly of education and the extent of its control over what is taught in the schools. Since the beginning of the present century and more particularly since the war of 1914-18 the right of the

state to provide education has been justified on the ground that it alone has at its command the resources to extend the benefits of education as widely as possible and to assure equality of opportunity for the preparation necessary for intelligent citizenship and for the promotion of ability and talent wherever found. There is always the danger, anticipated by Mill and exemplified in the pre-war Prussian system and in present day Russia and Italy, that a state system may attempt to mold all alike according to the views of a group in power and to interfere with the free cultural development of a country. This danger does not affect equally all parts of the educational system or all parts of the course of study. Uniformity may be insisted on in the elementary schools, in which the masses are educated, while scientific objectivity may be permitted in the secondary schools, in which the privileged classes are trained for leadership. Freedom in methods and content may be tolerated and even encouraged in all subjects except those, such as history, geography, social studies or economics, which may involve questions affecting the social, economic or political foundations of a country. In such subjects freedom may be curbed by limitations imposed upon the teachers, either through prior training and selection or through threat of dismissal, or by courses of study prescribed in detail or by the careful selection and censorship of textbooks. From this point of view, that is, the utilization of public education for the promotion of nationalism, there are few countries which refrain from direct control, as does England. The danger is by no means limited to countries whose existence is dependent on the acceptance by their citizens of some particular social, political or economic point of view. For in the last resort systems of public education are determined largely by the political, social and economic forces that determine a nation's character and by its cultural traditions.

I. L. KANDEL

SECTARIAN EDUCATION. In strict usage sectarian education denotes general education conducted under the auspices of minority religious groups or sects and is to be contrasted with education provided by established churches. In modern times the term is used to designate all general education provided for and controlled by religious associations in distinction from education conducted under the auspices of political communities.

The relationships of sectarian to state controlled education are as various as are the patterns of church and state relations. Four main types of relationship, with many subordinate modifications, may be distinguished: identification, affiliation, toleration with competition, and attempted suppression. Church controlled and public education are often identified in countries which maintain an established church or in communities with a religiously homogeneous population. In Sweden, for example, elementary education is controlled by the parish; the school board consists of the rector and other members elected by the vestry, while the bishop acts as superintendent. A variation of this type is to be found in countries where more than one religion is recognized, as in Newfoundland, where the state system of education is directed by three superintendents of whom one represents the Church of England, one the Roman Catholic church and one the United church, while the senior clergyman of each parish is always a member of the school board and each denomination is allowed to appoint teachers of its own creed. Modern Germany represents a similar variation, in so far as public schools are permitted to have a denominational character corresponding to the religious character of the community in which they are located, while both the support and the general control of education remain functions of the state. It is frankly recognized that each solution of the problem of control arising between competing religious and antireligious groups represents a compromise dependent on the distribution of political power within the particular community. A similar type of identification prevails in the Irish Free State, where education is also recognized as a function of the state, which provides support and prescribes standards, while in practise the schools are almost all under denominational management, primarily Roman Catholic but in some instances Episcopalian, Presbyterian or Hebrew. A somewhat similar situation prevails in Canada in the province of Quebec, where two sets of schools—Catholic for the French Canadian and Protestant for the English speaking population—are supported by public funds, drawn partially from a common source and partially from taxes separately collected from the respective groups.

The affiliation type of relationship is represented by England with its system of "provided" and "non-provided" schools, in which schools provided by the state and those estab-

lished and managed by churches or other associations are amalgamated into a single system. The state finances sectarian education in this system to a considerable extent and exerts some measure of control by prescribing standards, by requiring the provision of a limited number of free scholarships and by providing for non-denominational representation on the board of managers. Further, the denominational school is not permitted to discriminate against pupils on religious grounds, and while the school is authorized to teach the doctrines peculiar to the controlling church, parents may withdraw their children from such instruction. In Palestine the British government permits Jewish (Zionist), Arab and Christian sectarian schools but does not wholly meet their budgets.

The third type, that of toleration with competition, prevails in the United States. Under this system the state or local community undertakes no financial responsibility toward sectarian education but recognizes it as legally equivalent to the public school system, at least so far as compulsory attendance is concerned. While state aid has occasionally been granted to sectarian schools in recent times, more than forty states prohibit by constitutional provision the appropriation of public funds for sectarian purposes or that of public school funds for other than public school purposes. On the other hand, provision has been made in nearly all states for the exemption of sectarian schools from taxation. While in law sectarian schools are usually subject to state supervision, the amount of supervision actually exercised is not considerable in the majority of the states. A tendency toward a greater measure of state control, such as the requirement of certification of teachers and the regular inspection of private schools by public authorities, is becoming manifest. Control over secondary and higher education is indirectly exercised by state universities by means of admission requirements and the policy of accrediting recognized schools.

Modern Russia represents the fourth type of attitude toward sectarian education, inasmuch as the state exercises a monopoly over education and suppresses all sectarian education by law.

The history of the French school system illustrates all of the attitudes from identification to attempted suppression, with a modern tendency toward toleration. Prior to the French Revolution education, while a function of the monarchy, had been delegated to the church. Under the Second Republic and the Second Empire

sectarian, i.e. Catholic, schools were affiliated with the national system of education. The anti-clerical movements of the Third Republic, culminating in the separation of church and state in 1905, led to the attempted suppression of sectarian education. The suppression of religious teaching orders was designed to eliminate sectarian education and the number of religious schools was in fact greatly reduced. As a result of social changes brought on by the World War, however, and of the accommodation of the church to the situation the attitude of tolerance has become established. The state neither supports the sectarian schools nor does it prohibit them, but it exercises a certain amount of supervision over them, requiring the certification of teachers and providing directly through prescription and inspection and indirectly through higher examinations for some control of the teaching program.

There is great variation in the strength of the different parts of such independent sectarian educational systems as are to be found in the United States and in France, and also in the interest taken by the different religious denominations in this education. Broadly speaking, Catholicism is chiefly concerned with primary and secondary education, while Protestant church bodies emphasize higher education; Lutheran denominations, however, share with Catholicism the interest in elementary instruction, often establishing parochial schools where they are not permitted to influence public education. On the other hand, the changing social character of its membership has led the Roman Catholic church to found an increasing number of colleges and universities in the United States in recent decades. In elementary education in that country the public schools predominate to an extraordinary extent over competitive denominational systems, the latter enrolling only 10 percent of the total number of pupils attending these grades. Of this number the Catholic schools account for all save a few in the Lutheran schools. The largest Lutheran parochial school system, that of the Missouri synod, embraces about 1250 schools with a total enrolment of approximately 80,000, while Catholic elementary schools number over 10,000 and enrol nearly 2,500,000 pupils. While the Catholic elementary school system is increasing at a rapid rate, Protestant primary schools are steadily declining in importance as many denominations gradually abandon the effort to maintain a sectarian system.

A similar situation prevails in the United

States in the field of secondary education with sectarian and private high schools enrolling somewhat less than 10 percent of the total number of students. In this department of education also rapid increases are to be noted in the Catholic system, although the rate of increase is less than that of the public secondary schools, while high schools conducted by Protestant denominations account for about 1 percent of the total secondary school enrolment. The groups conducting the largest number of academies are Episcopalians, Baptists, Methodists, Presbyterians, Seventh Day Adventists, Lutherans and Friends. Nearly all religious societies in the United States provide and control colleges or universities. In this field sectarian and private institutions, most of which owe their origin to religious groups, markedly predominate in numbers and enrolment over the public institutions. Of 868,793 students enrolled in colleges and universities in 1927-28, 533,784 were enrolled in private or sectarian institutions. More than 200,000 of this number were students in schools still directly controlled by Protestant denominations while approximately 75,000 were being educated in Catholic institutions.

Finally, in almost all countries where there is no close affiliation between church and state and especially in countries where the separation has been accomplished, the sectarian educational system includes institutions for the training of the clergy and for other professional church officers.

The development of sectarian education as competitive with public education is due to the same factors which brought forth the latter: the rise of the democratic movement and of nationalism, with the correlate secularization of life, partly as a result of the industrial revolution. While these movements produced systems of public education they left denominational and other minority interests unsatisfied; and the elimination of all religious instruction from state schools—partly as a result of denominational conflict—outraged the convictions of those groups for whom the religious interest was the primary value in life. Wherever a homogeneous culture with a homogeneous religion prevailed, the problem of sectarian education did not arise, since under such circumstances the state system usually recognized the religious interest, whether in the state as a whole, as in the case of Scandinavian countries, or in religiously unified communities, as in the case of Germany. Religious and social heterogeneity, on the other hand, has

led to the development of non-sectarian public education and to the corresponding competitive sectarian system. Class conflicts in which the church and its schools were identified with the upper classes have brought forth non-sectarian educational systems with the continuation of the church schools in the interest and with the support of the defeated aristocracy.

The conflict of religious groups (which are often identical with racial groupings) with each other and the impossibility of satisfying their conflicting interests by allowing them all a share in an inclusive and efficient educational process, together with the state's interest in the promotion of national homogeneity, have led elsewhere, as in the United States, to the elimination of all religion from the public schools and the rise of competitive sectarian systems in which the minority demands could be fulfilled. The interest at stake which led to the development of sectarian education was sometimes primarily religious, as in the case of the Catholic schools; but sometimes it was racial, as in the case of parochial schools founded mainly to teach the language and to transmit the culture of a minority race whose interests in maintaining its solidarity and distinction could not be satisfied in public schools. It is easy to understand therefore why the problems of religious and minority nationalistic education became confused in pre-war Austria-Hungary. In the United States many Lutheran elementary and secondary schools were established more for the purpose of continuing the German or a Scandinavian language and culture than for the sake of promoting religion and were abandoned when that purpose could no longer be realized.

It is especially difficult to classify general education under Jewish auspices because of the differences of opinion among Jews themselves and among the governments of those countries in which they are dispersed as to whether they are to be considered a religious, racial or national minority. Thus in czarist Russia and elsewhere Jews willingly absented themselves from schemes of public education for religious reasons and were debarred from institutions of higher learning; in Soviet Russia, however, Jewish schools are permitted on the basis of a national minority but not as a sectarian group. In other countries a genuine problem has been raised, especially in the field of higher education, by the restriction of the number of Jews among both the students and the faculty. If therefore schools are set up by the Jewish religious com-

munity they are likely to become parochial and sectarian in character.

Furthermore, when conflict arises between the ethics of the state and the ethics of a particular sect, separate educational institutions may be set up. Thus the interest of the state in educating obedient citizens runs counter to the interest of pacifist sects such as the Quakers, the Dukhobors both in Russia and in Canada, and many others which have been impelled to resist the influence of nationalistic ethics upon their youth by providing special schools for them.

Another phase of the competition between public and sectarian education lies in the conflict between the claims of the state and of the family upon children. The recognition of sectarian education by the state is based ultimately upon its recognition of the primacy of family claims, yet it frequently conditions these claims by prescribing a part of the content of education carried on under other than state auspices.

Sectarian education, however, claims to justify its existence not only by reference to its role in providing for minority interests but also by the contention that it can provide for a more complete transmission of the social heritage than is possible for secular education which has eliminated the religion integral to the culture, and that in consequence it is able to inform the total educational process with a unifying philosophy of life which secularized education is said to lack. Furthermore, sectarian education whether competitive to the state system or affiliated with it asserts that it resists the process of standardization and thus contributes toward the enrichment of social life. Again, sectarian schools maintain that they give freer scope to educational experimentation and individual initiative than do the public systems. It is pointed out that the extension of education to the lowest social classes was inaugurated by church schools under the impulse of religious charity, and that adaptation to the particular needs of these classes led to the introduction of "realistic," scientific and vocational subjects into the curriculum. More recently sectarian interests have led the way in the education of the Negro in the United States and of backward races in colonial possessions; religious organizations, such as the Young Men's and the Young Women's Christian Associations, have made contributions to the advancement of adult education. The association of religious with ethical interests and emphasis upon the motive of benevolence have

led sectarian institutions not only to extend the scope of education to unprivileged groups but also in some instances to modify the curriculum in the interest of liberal humanitarianism.

While such claims may justly be made for some portions of the sectarian system of education, its tendency on the whole appears to be more conservative than that of public education. Despite the willingness of the academies to accept scientific subjects, sectarian secondary and higher schools have generally maintained the classical curriculum far longer than did the democratic public schools. While sectarian schools for women have been occasionally founded, the churches have remained far more interested in the education of men and have been slow to accept coeducation. In methodology also sectarianism has often resisted improvement or innovation, yet this backwardness was probably due as frequently to the comparative poverty of sectarian schools as to a native conservatism. Furthermore, sectarian schools have been subject to criticism because their primary interest in the religious aim of education, together with a denominational or dogmatic interpretation of that aim, has prevented them from giving due recognition to other values of education, including the economic and political as well as the cultural and scientific.

Criticism of sectarian education is not confined to its frequent pedagogical insufficiency but is due also to its sociological character. While representing minority interests it has sometimes sought to prevent the realization of majority interests, as, for example, when sectarian groups attempted to block the establishment of non-sectarian and inclusive public education in Massachusetts in the time of Horace Mann. The occasional association of sectarianism with pre-democratic class structure and its continuation of the aristocratic tradition in schools have been other sources of antagonism in democratic countries; thus the French laws restricting sectarian education were inspired in large part by the association of clericalism with royalism, while the criticism offered by Liberal and Labour groups concerning measures granting state aid to voluntary schools in England was due in part to the class character of many church schools.

When sectarian education serves to continue the language and tradition of a minority racial group, especially when the political loyalty of such a group is suspected, as in the case of German sectarian schools in the United States at the time of the World War, the sectarian

system inevitably arouses antipathy. On the other hand, sectarian systems may be suspected of fostering the interests of an imperial economic or political class or race, as in the case of missionary schools in the Orient and in Africa or of government controlled sectarian schools established among minority populations in pre-war Austria.

While areas of conflict between sectarian and public schools are still to be found, the antagonism between them has declined in recent times in most countries. For example, the acceptance of secular aims of education and the abandonment of narrowly defined religious aims in the Protestant educational systems have allowed them to adjust their curriculum and methodology to the pattern of public education. Growth of tolerance between the denominations and their acceptance of the separation of church and state have further helped to eliminate conflict. On the other hand, the state's abandonment of efforts to exercise monopoly over education, its acceptance of a more or less regulated sectarian education as equivalent to the public school system or its permission to religious groups to participate in public education, has contributed much to the achievement of a balance of interests in the United States, France, Germany, Great Britain and other nations. Where churches have been refused permission to make religious influence effective through public education they have tended to organize programs of religious education complementary to but quite separate from secular instruction and have thus removed their interests from the area of conflict.

The problem of sectarian education, however, is intimately associated with the balance of power between church and state, with the relations of minorities and majorities and with the interaction or conflict of religious, economic and political interests. At the points of conflict between these institutions, groups and values the problem of sectarian education may arise in the future as it has arisen in the past.

H. RICHARD NIEBUHR

PART TIME EDUCATION. Part time education includes those forms of schooling which are organized to fit the leisure time or are taken out of the working time of juveniles and adults. Of these various types Great Britain has contributed the evening tutorial class and university extension; Germany, the part time day continuation school for young workers; Denmark, that variety of the short course known as the people's

high school; the United States, the cooperative and its near relative, the self-help college.

The most thoroughgoing program of part time education is that planned by Soviet Russia for adults and working youth in cities and rural communities. For this work school teachers, union leaders, party workers and high school and college students have been commandeered and given short courses preparatory to teaching. Industrial enterprises are directed to reserve a certain number of places for student workers. The entire program is based on the theory that it is advantageous to combine work and schooling from youth to old age.

In the past part time schooling has had a more important place in Europe than in America. Since the sixteenth century Sunday schools have taught illiterate Europe and England to read the Bible. Churches have often added week day secular instruction as a reward for Sunday school attendance. Workmen who have learned to read have formed evening classes for general and vocational improvement; joined trade unions and cooperatives; set aside union and cooperative funds for further education; demanded extension of the suffrage, free public full time schools for their children and shorter hours of labor.

British workingmen have been active in organizing their own educational programs. In the nineteenth century they started evening technical classes; many of these became endowed mechanics' institutes and later technical colleges with day and evening or only evening classes. Labor colleges and classes train trade union workers. A college at Manchester offers training to employees of cooperatives of every country. The workingmen form classes for general instruction, especially in the social sciences, and ask the universities for instructors: it was in this way that university extension work began in England. Various organizations interested in promoting educational opportunities for workers were brought together in 1903 in the Workers' Educational Association, which has its counterpart in all the British self-governing colonies and in many other countries. In 1928 it reported 35,730 students; of these 10,000 were in tutorial classes, pledged to follow a definite three-year program of evening school university extension work.

While the English have led in the planning of evening school programs, especially in the fields of general culture and political and economic action, they have not gone far in providing for day part time schooling for young workers. The

Fisher Act of 1918, which provided for compulsory continuation schools for young workers, has never been put into operation. The evening class is still the popular method of part time education in technical and general work for juvenile as well as for adult workers in city and country.

In the self-governing British dominions the English tradition is quite closely followed. All have their workers' education associations and university extension classes. In Canada each province has laws providing for evening vocational and general classes. The province of Ontario has a compulsory continuation school law. The province of Alberta, Canada, New South Wales in Australia and the Union of South Africa all have provisions for public supervision and part time school attendance of apprentices.

The contribution of the German states to part time education is the compulsory continuation school for juvenile workers. In the sixteenth century Sunday schools were established to teach religion, singing, reading and writing. In 1739 Württemberg made attendance at a Sunday school compulsory for boys and girls not in full time school; Bavaria passed a similar measure in 1803. Later part time and evening classes were provided on other days, financed usually by public funds or by chambers of commerce. An imperial law empowered communities to set up compulsory part time schools. The new constitution of the German Republic declares for the principle of compulsory continuation school attendance up to the age of eighteen; and although there is no national law, the states are rapidly meeting this standard.

The Danish folk schools have spread from Denmark to Norway, Finland and Sweden. Originally short term boarding schools where farm youth could live for a few months absorbing the national culture, they now frequently include agricultural and home making instruction. Everywhere except in Sweden, where they are public institutions, the folk schools are under private direction with government aid. Several private folk schools have been founded in the United States.

Almost every European country now has its resident rural high schools offering short courses in agricultural and general topics, with evening classes for the neighboring community; its day continuation schools, compulsory or voluntary; its evening and general classes of every grade; its classes for trade unionists and party members. A unique institution is the Chitalishta of Bul-

garia. This is a combination library, theater and social hall built in the various communities in the days of Turkish rule to maintain through education the struggle for national freedom. Returns from 506 of the 1984 Chitalishta showed 337,620 people attending evening classes. Another unique method of providing part time education is reported from Chile: boys in the upper grades are employed part time in instructing their parents and neighbors in evening classes; illiteracy is said to have been reduced in three years from 60 to 20 percent by this method. Although British India with 296,000,000 illiterates out of a total population of 319,000,000 (including 60,000,000 untouchables who are often turned away from the schools) is still a practically undeveloped field for full time as well as part time education, it is reported that about 200,000 adults are attending night schools.

A wide variety of part time schooling, vocational and general, is found in the United States. Private corporation schools have trained a limited number of young people working in large industries. The rank and file of untrained workers lack opportunity for promotion and suffer from inability to readjust themselves when changes in machinery or industrial organization throw them out of work. As a remedy for this continuation schools providing instruction for a few hours a week for young workers have been set up in many industrial centers by means of state laws. These range from the merely permissive to the Wisconsin law requiring all cities of 5000 or over to establish continuation schools and all young workers who are not high school graduates to attend half time to the age of sixteen and eight hours a week to the age of eighteen, and requiring all apprentices under the state supervised system to attend four hours a week for the first two years of apprenticeship.

Very significant is the rapid growth of evening classes in city and country, but even more significant is the changing character of the courses. In addition to cooking and sewing home making education now includes the study of food values, clothing selection, home nursing, home planning and decoration, gardening, landscaping and, most important of all, child care and training. To manual training has been added a variety of vocational courses. Wisconsin has initiated a plan whereby itinerant instructors are employed by several neighboring cities for day work with apprentices and for evening work with journeymen. There has been an increase in the number of courses in foreign languages, literature and

the social sciences. Work in rural communities, aside from classes for illiterates, is just beginning but in some states it doubles yearly. Late afternoon and evening classes of college grade are increasing rapidly. The municipal colleges are outstanding in this field; other universities have followed their lead, and many give extension class work in neighboring communities.

When the day continuation school for young workers made its appearance in the United States it was at first looked upon as a weak substitute for full time schooling. Later it was regarded as a more effective method of vocational education than the full time trade school because it furnished a background of working experience. The so-called cooperative school represents a conscious attempt on the part of educators to create a condition of part school and part work by securing jobs for young people in school and using their working experience as part of the material of instruction. Under the cooperative system, started in 1906 in the College of Engineering at the University of Cincinnati, pupils work half time and attend school half time in two shifts. Most of the cooperative courses offered in this and other universities and in secondary schools are professional courses, but Antioch College at Yellow Springs, Ohio, has adapted itself to letters and science courses as well.

Besides the cooperative colleges, which stress the educational value of work, there are in the United States a number of self-help colleges, which use work primarily as a means for helping students through school. Among these are Berea College, Kentucky; Blackburn College at Carlinville, Illinois; Oakland City College at Oakland City, Indiana, which manufactures fountain pens; Park College at Parkville, Missouri; and the Textile Industrial Institute at Spartanburg, South Carolina, which operates a textile factory.

The main types of workers' education developed in the United States are the resident labor colleges, the summer schools for industrial workers, the evening labor colleges or classes, set up independently by local labor bodies or in cooperation with the boards of education or, as in California, with the university itself, Chautauquas, institutes and conferences. The resident colleges are Brookwood College at Katonah, New York; Commonwealth College, a self-help college on a farm near Mena, Arkansas; and the Vineyard Shore School for Women Workers in Industry at West Park, New York. The Rand School of Social Science in New York City,

owned by the Socialist party of America, gives short residence courses and evening courses for training workers in the party, the unions and the cooperatives, as does the Workers' School maintained by the Communist party. Several summer schools "give workers in industry an opportunity through study and discussion to develop a deeper appreciation of life and a clear understanding of their part and responsibility as industrial workers." The Bryn Mawr and Barnard College schools and the Southern Summer School near Asheville, North Carolina, are for women workers; the school at the University of Wisconsin is for men and women workers; the Colorado Workers' Summer School, which meets in the mountains near Denver for a ten-day session, is for farmers and industrial workers of both sexes.

Practically all the universities of Europe and America and all the teacher training colleges offer summer courses. Universities on the continent, in Great Britain, Mexico, Porto Rico, Hawaii, Brazil, Japan and elsewhere plan summer courses for foreigners in languages, economic and social problems, education, literature, music, international relations and science. Various organizations at Geneva offer short courses for teachers and students of international relations.

Part time education may do more than merely offer the same opportunities as do full time educational institutions. It often affords a field for experimentation in the range of topics and the method of approach. A significant experiment in adult education, the New School for Social Research in New York City, aims to give "due recognition to every serious contemporary intellectual interest." Its curriculum therefore is broader than the term social sciences might indicate and has succeeded in attracting to it a student body that ranges from the self-taught to the P.H.D.

It is beginning to be realized that no one can fully prepare himself in his youth for activity in a society as dynamic as that of modern western civilization. In order that the individual may adjust himself to changes which may throw him out of employment or bring him face to face with new social problems he must keep himself flexible. His best insurance against unemployment and social ineffectiveness is continued schooling. Educators are giving increasing attention to the problem. Part time schooling is no longer considered a poor makeshift for unfortunates who have failed to receive adequate full

time schooling in their youth; it is assuming the dignity of a very effective method of education deserving universal application.

JENNIE McMULLIN TURNER

EDUCATIONAL FINANCE. Education in the United States during the year 1928 cost approximately \$2,945,000,000, about 3 percent of the total national income. The part of the total expenditures for education coming from taxes constituted about 20 percent of all taxes raised. Education is the most expensive function of government with the exception of defense activities, including war costs. The expenditure for highways and streets is the only other item of governmental cost that even approaches the tax burden of education.

Of the total amount spent for education in 1928 approximately \$2,440,000,000, or somewhat over 80 percent, was spent for public education. Approximately \$505,000,000 was spent for private schools, colleges and universities. Elementary and secondary schools account for about 80 percent of the total cost of education, probably \$2,400,000,000 out of \$2,945,000,000. Of the expenditures for elementary and secondary schools about 90 percent goes to public schools and 10 percent to private schools. An insignificant part of the amount reported under elementary schools is expended for preschool and kindergarten facilities. The total expenditures on higher education were about \$505,000,000, of which \$300,000,000 was for private institutions. A small sum was spent upon adult education, not more than a few million dollars.

Of the approximately \$2,200,000,000 spent on public elementary and secondary education about 65 percent went to instruction. This item is almost entirely teachers' salaries. Less than 5 percent was spent upon the general administration of the school system. The operation and maintenance of the physical plant cost approximately \$300,000,000, or about 15 percent of the total. Interest charges and debt retirement and certain miscellaneous items accounted for the other 15 percent. It is not unusual for \$300,000,000 worth of bonds to be issued in a single year for public school construction, and over a period of years this of course makes a very heavy interest charge. The item of interest alone accounts for about \$100,000,000 a year of the cost of public elementary and secondary education. The amount spent on construction of new buildings was almost \$400,000,000, but this cannot be considered a cost against the current

year. Although the expenditures for health, athletics and certain recreational activities are growing very rapidly, they still constitute a very small amount of the total school expenditure.

In higher education we find a somewhat different distribution of costs. The items of research and instruction together account for a slightly larger proportion of expenditures than does instruction in the lower schools. About 70 percent of the total cost of higher education is chargeable to instruction. Expenditures for operation and maintenance are about 15 percent and a long list of miscellaneous items accounts for the other 15 percent. There is an important difference in regard to buildings, because it is not customary to borrow money for college and university buildings whereas it is the usual procedure for the public elementary and secondary schools.

The expansion of the cost of education in the United States has been phenomenally rapid. For elementary and secondary education alone the cost in 1900 was approximately \$225,000,000. By 1910 this had increased to \$445,000,000. By 1920 it had increased to \$1,050,000,000 and by 1928 to \$2,200,000,000. Some of the increase, particularly from 1900 to 1920, was due to a change in the value of the dollar. A large part of the increase was due to the remarkable expansion of the secondary school, which increased in number of students from approximately 700,000 to well over 4,000,000 between 1900 and 1928, and the lengthening of the school year. The increase in high school attendance between 1890 and 1924 is estimated as being 2465 percent in comparison with 156 percent for elementary school attendance, 352 percent college and university attendance, and 79 percent increase in the total population. Some of these factors, such as the increased proportion of children in school, cannot continue to operate indefinitely, for over 90 percent of the children between seven and fourteen are now in school.

Expenditures on education are higher per capita in the United States than in any of the major European countries, but when financial ability is considered the differences are not so great. For instance, England is spending about \$500,000,000 compared with \$2,945,000,000 in the United States. On a per capita basis this is about half the expenditure in the United States, but in relation to income England is spending very little less than the United States.

France and Italy spend substantially smaller sums per capita than England and Germany,

but when taken in relation to national income they compare very favorably. Comparisons are made difficult in view of the great variations in the items which make up the total expenditure, as, for instance, in the range of teachers' salaries, which constitute the major part of the total cost. The Soviet Union has greatly expanded expenditures on cultural activities, and the budget for 1931 provides for about \$3,000,000,000. This includes a far wider range of cultural activities than formal schooling, so it is not comparable with the figures in any other country.

Judgments as to the adequacy of the amounts at present being spent in various countries for formal education must vary with varying social valuations. On a strictly economic basis, however, the great increase in expenditures for education probably could be justified only in case the system had been carefully planned in terms of the educational needs and the economic capacity of the population. Up to the present time no country has worked out a carefully prepared scheme of education in terms of the needs of the entire population. Germany before the war and since has made certain interesting moves in that direction. The Soviet Union, in the last year or two, has started an interesting experiment along this line. One may reasonably question the value of a large part of the money spent for education and still believe that a properly planned system of education would demand a very much larger percentage of the total income than it does in any major country today.

Probably 80 percent of the total revenue of schools in the United States comes from taxation. About 80 percent of the total amount of taxation comes from an antiquated and archaic property tax. Hence it is evident that taxes on property are the major source of money for formal public education in the United States. In theory at least private schools receive no aid from public sources. The total spent for private education is approximately \$505,000,000. Of this amount probably \$300,000,000 comes from fees paid by the students who attend school. Perhaps \$60,000,000 comes from endowments; \$75,000,000 from gifts for current expenses and the additional \$70,000,000 from a large number of miscellaneous sources. Less than half of higher education is publicly supported. Perhaps two thirds of this amount comes from taxation, sometimes from the general state or city fund, sometimes from a specific tax for higher education,

Private gifts to education have recently amounted to over \$100,000,000 a year. A large part of this of course goes to permanent endowment and only the income appears in the figures given above on the cost of private schools. In the past practically all of this money went to higher education, but at the present time many millions of dollars are being given to public elementary and secondary schools each year for a great variety of purposes.

As education has become more expensive the poor communities have become unable to provide adequately for it. One of the most difficult issues confronting public education at this time is how far the nation or state should go in subsidizing such communities. The federal government contributes almost nothing to the support of education in the United States, but in extreme cases as much as 80 or 90 percent of the total cost of education in local communities is being paid from state grants. In a state such as New York about \$100,000,000 a year is distributed by the state to the different school districts.

The development in England has been such that at the present time the central government and the local governments each pay about 50 percent of the cost of public education. In Germany the situation is more nearly comparable to that in the United States. In France and Italy with their more centralized systems the central governments make substantial contributions to the system of education. Each republic in the Soviet Union is in theory largely responsible for education; some contributions are made by the central government, but a large part of the cost is borne by the local districts.

Taxation, fees, gifts and income from endowments provide the major sources for the support of formal education. Taxation will without doubt be used to an increasing extent. If education is to be planned so that it is adjusted to the economic life of the country, the fees should be reduced, perhaps even ultimately abolished. There is considerable discussion on the advisability of increasing gifts for endowments of public education.

Control of finance is control of policy, in education as in other fields. There is a tradition of freedom within certain limits in American schools both public and private. As long as one is operating within the generally accepted fields of discussion and opinion, there may not be great danger. Usually it is only in controversial issues upon which there is deep feeling that

financial pressure is exerted to secure agreement with the opinion of those in control. At the lower levels in both public and private schools the tendency has been to use financial control as a means of preventing discussion of these issues. This is done not so much by actual prohibition as by a process of selection of teachers: teachers are chosen who will have the proper attitude, "proper" being interpreted in reasonable agreement with those in financial control. But financial control does not indicate any one set of economic beliefs or even high economic status, for in the case of certain religious groups those in financial control may be very poor.

In the case of institutions definitely under the control of religious organizations it is customary to exercise very careful scrutiny over the beliefs of teachers before they are employed. This attitude extends even into the higher schools and colleges. The result is on the average probably much less open discussion of many issues in the schools definitely under the control of religious bodies than is the case in other schools. The private institution is under one type of pressure, the public school under another. Although private institutions in many cases claim to be free, their policy in regard to the appointment of the staff is doubtless dictated at times by a desire not to alienate the support of wealthy groups. The public institutions are just as insistent that they are free but undoubtedly are careful in many directions not to offend the legislature and the public that control their support. Except for a very few cases the records of both types of institutions are fairly good as far as the more overt cases are concerned. It is in the selection of faculty that a most subtle difficulty appears.

An additional problem may arise in the future in the case of some of the private institutions which have been given very large sums of money coming from certain specific industries. In a few cases in the United States the control of important industries might revert to universities in case of financial difficulties. This raises again the whole question of the relative efficiencies of endowments as against taxation or current gifts as support for education.

One of the most acute phases of the struggle for control in England has been in regard to the place of religious instruction. Each religious group desired to keep its own schools and receive public money. The schools supported entirely by public funds have developed relatively so much more rapidly that the issue has

receded somewhat into the background. Moreover, the fact that in many of the schools students are from the same social class makes it easier to adopt the attitudes of that class on economic issues.

The religious issue was bitterly fought in Germany for a long time and it is far from settled even now. A number of public schools in Germany reflect very definitely class positions and attitudes, especially where the group attending the school is fairly homogeneous. In both Italy and France very careful watch has been kept upon the opinions of the great mass of teachers. The higher schools and universities have, however, much more freedom; usually the best of the universities attempt to prevent direct interference with teachers' opinions, although the subtle force of selection undoubtedly plays its part. Russia is without doubt the supreme illustration of the maintenance of a class attitude throughout all the schools. Whether the situation in Russia is much worse than in other countries, including the United States, is a question which will be answered largely on the basis of one's prejudices. Certainly the existence of methods of control is admitted more freely in Russia than elsewhere.

Expenditures for education show evidence of a tendency toward rapid expansion. This expansion has proceeded until about 3 percent of the total income in the United States in 1928 was spent on education in contrast with 1.5 percent in 1913, and about the same percentage of the gainfully employed population was working in formal schools. In the future much more attention is likely to be given to education by means of other institutions with a corresponding expansion of expenditures for education through these organizations.

EDUCATIONAL PSYCHOLOGY. The development of educational psychology as a separate discipline is largely a product of the present century. The *Zeitschrift für pädagogische Psychologie* began publication under the editorship of Ferdinand Kemsies in 1899, and the *Journal of Educational Psychology* followed in 1910. There were at the close of the century numerous books on genetic psychology, child psychology and psychology applied to education. But in the main these and the courses in which they were used as textbooks dealt with such topics as memory, attention, perception, feeling and voli-

tion, all taken from the introspective psychology of the time. The transformation of this point of view and the growth of educational psychology as a special study in the United States is largely attributable to E. L. Thorndike. In his attempt "to apply to a number of educational problems the methods of exact science" Thorndike adopted a point of view which was later to become an objective psychology. His *Educational Psychology* (1903) was primarily concerned with individual differences, already treated by Francis Galton in his *Inquiries into Human Faculty and Its Development* (London 1883), continued experimentally by J. McKeen Cattell (1886 *et seq.*) and defined in a monograph *Über Psychologie der individuellen Differenzen* (Leipsic 1900) by William Stern. In his elaboration of the subject Thorndike added instinct and the learning process. These three topics constituted the theme of Thorndike's three-volume work, *Educational Psychology*, published in 1913, the first volume of which is called *The Original Nature of Man*, the second, *The Psychology of Learning*, and the third, which incorporates the earlier book, *Individual Differences and Their Causes*.

Thorndike advances the theory that the reflex arc is the hereditary unit of behavior, and he seeks a general interpretation of all learning and all individual differences in terms of the number and facility of the bonds of connection which are originally formed or can subsequently be formed between elements of the nervous system at their synaptic junctures. In accordance with this view learning is regarded as the formation of bonds of connection between "a situation S and a response R." The results of his earlier experiments upon animal learning, first published as a monograph (in *Psychological Review*, monograph supplement, vol. ii, no. 4, vol. iii, no. 5, 1898-1901) and later as a book, *Animal Intelligence* (New York 1911), seemed to warrant the belief that these connections are established in two ways: by exercise and by the terminal influence of a satisfying effect. While the law of exercise expresses a mechanical principle of facilitation whereby the resistance to nervous conduction is reduced by use and increased by disuse, the law of effect is not so readily accounted for in mechanical terms. Since Thorndike refers satisfaction and annoyance to the readiness or unreadiness of an action system to function, the learning of a new and unprepared for act does not receive the desired explanation—because the effectiveness of an act is exhibited

after the event and not during the event, as it must needs be if some acts infrequently exercised are more readily learned than others which are frequently repeated.

The behaviorists under the leadership of John B. Watson reduce all learning to exercise alone by invoking the conditioned reflex as the sole means of modifying behavior. Simply—all too simply—stated, the unconditioned responses of an organism are given. Learning consists then in attaching an unconditioned response to a new or "unnatural" stimulus; the response is then said to be conditioned whenever it has taken place together with an alien or unnatural stimulus often enough to produce the response without the presence of its natural stimulus.

The difficulty in both these explanations is the unsolved problem of integration or organization of behavior. Education is not a mere matter of drill and training; it is a matter of many sided development giving rise to the unified procedures of a self-reliant human being. In order to account more adequately for this result of education the psychoanalytic school makes the emotional life of man the effective core of his behavior and seeks in desires and their fulfilment or frustration an explanation of his endowments, his learning capacities and his individual differences. As desires are fulfilled, tensions are released and an organic equilibrium is established. Education then is rooted in man's instinctive cravings. Since, however, the complexity of practical affairs is too great for immediate satisfaction in all cases, these desires remain in part unfulfilled, leaving active tendencies to seek such expression as they may in lapses, dreams and idealistic sublimations. The problem of education is to release these tensions by appropriate means of expression in order that an otherwise tortured soul may find an adjustment to his fellows and to his environment in general. The weakness of the psychoanalytic theory of education is the obscurity of its principles of behavior. The notions of unconscious motivation, censorship and release furnish no clear understanding of what is the precise nature of the physiological and psychological bases of desire.

Another theory of behavior, which is truly of ancient vintage, is advanced by William McDougall as a hormic psychology. According to this view a purposive striving is the basic fact in behavior. Thus no explanation of man's learning is required; instead, one may ask why man fails to learn more readily and effectively than

he does. Based upon a given number of individual and social instincts learning is but a refinement and habituation of these original forms of behavior in their cognitive, emotional and conative aspects.

Gestalt psychology offers still another solution to the problem of learning in proposing to regard both physiological and psychological processes as unitary structures, the analysis of which leads to the discovery of subordinate structures but not to elements of reflex action or conscious process. Learning then will consist in the formation of a new structure both in experience and in behavior, either by the differentiation of a subordinate structure or by the assimilation of two or more previously existing structures. The details of these formations depend upon the graded features of experience and behavior and upon the redefinition of existing structures and gradations into new and unique forms. In other words, Gestalt psychology renounces the mechanism of the stimulus-response and conditioned reflex hypotheses and underwrites the psychoanalytic and hormic psychologies of desire with concrete psychophysical structures that owe their origin and change to field conditions rather than to external stimuli or internal purposes. A *Gestalt* is a structure in a field of forces which maintain, modify or destroy it. Yet its structural integrity can within limits select the forces conducive to its maintenance and completeness. Hence the learning process of an organism as a *Gestalt* is centrally motivated and selective of the means at its disposal for satisfying the wants of its structure as a behaving creature.

The scope of educational psychology in this country has been determined externally by requirements imposed upon persons seeking certification as teachers in secondary schools. Internally the subject has defined itself within the limitations of psychology as a growing science. The external limits led to the standardization of a course which would carry a minimum credit recognized by the certifying agencies. Since secondary school teachers are often trained in colleges of liberal arts rather than in normal schools or teachers' colleges, this requirement has led to the modification of existing courses in psychology and to the addition of special courses in educational psychology.

The internal development of the subject has been focused on the learning process, first introduced into the psychological laboratory by Hermann Ebbinghaus' classical experiments on

memory in 1885. The extensive series of investigations which followed under the leadership of such men as G. E. Müller and Ernst Meumann established many important features of the economy and technique of learning, but the experiments on animals, to which Thorndike and Watson gave the chief impulse, contributed most to an objective theory. In addition to these experimental leadings the study of individual differences begun by Francis Galton resulted in the elaborate devices of the mental or aptitude tests. Here we find the independent and influential efforts of such men as Alfred Binet, the author of the intelligence scale; William Stern, the author of a psychology of individual differences; and C. Spearman, the author of a conception of general intelligence. A third leading, which only recently has begun to be employed experimentally, is the study of infancy and childhood. Child study has produced a wealth of material, much of it anecdotal, recorded by psychologists of various countries. Authors of importance in this field are W. Preyer, William Stern, James Sully, Millicent Shinn and more recently K. Bühler, K. Koffka, J. Piaget, Arnold Gesell and J. B. Watson. The late G. Stanley Hall contributed largely both in his own writings and by publications in his journal, *Pedagogical Seminary*, to the encouragement of studies of this character, as did also J. Mark Baldwin. In summarizing and interpreting the results of these observations of childhood, theories of development resting upon the general theory of organic evolution have played an important part.

In general, the varied theories and experiments on child behavior, learning and individual differences have converged in two issues: the one mechanistic and the other teleological. Of these the former has seemed to have the sanction of a rigorous, scientific interpretation of facts, while the latter has suffered from the charge of being unscientific and therefore untrue.

It is a paradox that the aims and objectives of educational procedures which common sense defines in terms of an improvement in individual and social life should when subjected to scientific scrutiny reduce themselves to a set of forced actions in which either a hereditary bias or an environmental set of conditions determines every educational change. Within the ranks of the rigid experimentalists, who find no justification for anything that smacks of purpose, it was quite recently the fashion to regard hereditary bias as all important. The problem of education

was supposed to be largely solved by tests calculated to determine the limitations of individual capacity. It was argued that each individual works within the limits of his endowment and may be counted upon to make the best he can of his capacity. Educators need only test the individual and supply opportunities within his range; he will then take care of his own education. But now from the same camp there is the contrary notion of J. B. Watson that environment is all effective. "Give me," he says, "a dozen healthy infants, well-formed and my own specified world to bring them up in and I'll guarantee to take any one at random and train him to become any type of specialist I might select—doctor, lawyer, artist, merchant-chief and, yes, even beggar-man and thief, regardless of his talents, penchants, tendencies, abilities, vocations, and race of his ancestors" (*Behaviorism*, p. 104).

But while the controversies between determinism and teleology, heredity and environment, still flourish among educational psychologists, similar questions are assuming a new aspect in physics and biology. It is no longer a mark of reproach to mention indeterminism in physics, and the question of nature or nurture is being answered by considering behavior itself as the primary subject of biological inquiry. Thus revised, purposive striving on the part of an individual or group, leading to the discovery of new and indeterminate facts and to the learning of new and indeterminate ways of dealing with facts, is no longer evidence of a mysterious force which shapes ends to fit a prearranged plan. Instead, the formation of behavior, as revealed by the studies of C. M. Child and G. E. Coghill on embryonic development, by K. S. Lashley on experimental neurology and by W. Köhler on the learning of apes and other animals, has become a problem of dynamics. That is, the problem of behavior is no longer defined in terms of a bodily machine, limited in its action to a few degrees of freedom; for the machine itself is a product of behavior developing its own limitations as it behaves.

Thus the psychology of education need not be reduced to conscious contents, associated, apperceived or acted upon by external agencies of mind or body, nor to reflex units in complex combinations that give forced responses to external stimulation. Instead, we have a new conception of the individual and the social group as behaving creatures which by a process of differentiation develop subordinate forms of behavior

each conditioned by the structural nature of the whole organism in its field of action. There must be indeterminateness in the sense that we are not dealing with a world of finite entities which can be counted and their action with one another explained in terms of a calculus of unit forces. Purposiveness also exists, not in the sense of an obscure agency for the attainment of ends but rather as a fundamental pattern the integrity of which is maintained and promoted by its own essential nature as a living, growing form of behavior.

EDWARD I (1239-1307), king of England. Edward is traditionally known as the "English Justinian"—an appropriate name if one considers his tremendous interest in law and the fact that his statutes summarized and supplemented the teeming and disorderly common law growth of the preceding century; inappropriate if it implies a common law completed or decadent. Edward began with a nation wide investigation of private jurisdictions. This was followed by the writ of *Quo warrantum*, which established the principle that no new franchises should be acquired except by royal grant: thus time would extinguish them. The Statutes of Westminster I and II in 1275 and 1285 formulated much unwritten law, and the second contained the enact-

ment (*de donis conditionalibus*) which made possible the creation of entailed estates and also reorganized the circuit courts, laying down the *nisi prius* principle. Mortmain in 1279 prohibited alienation of land to the clergy, and Merchants in 1283 made it easier for traders to collect their debts. Winchester in 1285 elaborated the old regulations touching militia service and local maintenance of the peace. In 1290 the Statute of Westminster III, known also as *Quia emptores*, regulated the sale of land, enacting the new principle that the purchaser should hold of the seller's overlord, thus preventing subinfeudation. Such statutes indicated the passing of the old feudal order and enunciated law some of which holds even to the present. Only two or three other periods of English history are comparable with this for legislative importance. A legal profession developed; and since church influence was withdrawing clerks from state service, laymen had to be trained, and the first traces of the Inns of Court appeared. The *Year Books*, beginning in 1292, marked vivid interest in law; and the chancellor, soon the center of a new equitable jurisdiction, became the king's chief minister.

Representation of shires and boroughs in central assemblies grew, and in 1295 under stress of war Edward gathered a more complete representative assembly than before—the so-called Model Parliament. The Council became more clearly defined and was the center and nucleus of Parliament. War made the taxing problem acute, customs duties became important and in 1297 in the most notable of all confirmations of Magna Carta the king conceded the principle of no taxation without consent of the taxed. Edward conquered Wales, attempted to conquer Scotland and fought with France to retain the English holdings there; but his reign's greatness—unquestionably the expression of his own qualities—was in the realm of law and the constitution.

EDWARDS, JONATHAN (1703-58), American theologian and philosopher. At the age of twenty-three, seven years after his graduation from Yale, he was called as assistant to his grandfather, Solomon Stoddard, influential Congregational pastor of Northampton. The intense fervor of Edwards' religious life, characterized by an overwhelming sense of the glory and sovereignty of God and of the blessedness derived from complete submission to His will, communicated itself to his audiences, resulting in a wave of religious enthusiasm which, temporarily at least, transformed the character of New England Puritanism. Shifting the emphasis of Puritan theocracy from the social and political realm to the inner life of the soul, he stressed with the full force of his dialectical skill and spiritual vigor the necessity of depending entirely upon God's free grace for salvation. Edwards' unusual effectiveness in arousing "experimental religion" in others culminated, with the aid of Whitefield's itinerant preaching and other factors, in the widespread religious movement known as the "Great Awakening" (1736-41) and thus was instrumental in establishing the practises of revivalistic evangelism, which for many generations remained one of the characteristic features of American life. Nevertheless, he disapproved of the violent physical expressions which seemed to be an increasingly prominent feature of the revival meetings and insisted that "the true mark of the work of the Spirit" is to be found in "Christian practise." His critical *Treatise on the Religious Affections* (*Works*, vol. v, p. 1-344) is a classic of the psychology of religion. Nor did he sanction the tendency to "separate" from the regular churches. Encouraged by the unusual success of his ministry, Edwards made an attempt to enforce at Northampton certain disciplinary reforms, such as the strict interpretation of the qualifications for communion. His congregation, however, reacting from its recent enthusiasms and preferring the extremely lenient discipline of Stoddardeanism, with which they had been familiar for half a century, resented Edwards' proposed change of policy; and after a protracted dispute Edwards in 1750 was dismissed.

During the next seven years, while serving as pastor and missionary in the frontier settlement of Stockbridge, Massachusetts, Edwards was

more free to return to the abstract problems of metaphysics and philosophy, which in his college days, before his preoccupation with church polity and practical theology, had absorbed his interest and had inspired him to formulate in his "notes," *Of Being* (*Works*, vol. i, p. 706-08) and *The Mind* (*Works*, vol. ii, p. 664-702), an idealistic philosophy, which was significant because it anticipated later idealistic doctrines. His early idealism was based on Newton, Locke and the Platonists. He now developed his philosophy on a Calvinistic basis, emphasizing the doctrines of the sovereignty and perfection of the divine will and the moral justification of determinism, original sin, election and retribution. His most important works of the Stockbridge period are *A Careful . . . Inquiry into the . . . Freedom of Will . . .* (1754) and *Two Dissertations (I) Concerning the End for which God Created the World; (II) The Nature of True Virtue* (1754), which in the main attempted to provide by metaphysical reasoning a verification of the main tenets of Calvinistic theology. His work resulted in a new school of Calvinism, called the New England or Edwardean theology, which served as a powerful check to the growing liberalism of his time. The carrying out of a final work, which Edwards had contemplated as a *summa* of his theology and philosophy, was prevented by his acceptance of the call to the presidency of New Jersey College (Princeton) in 1757 and by his death the following year.

EFFICIENCY in the sense of a ratio between input and output, effort and results, expenditure and income, cost and the resulting pleasure, is a relatively recent term. In this specific sense it became current in engineering only during the latter half of the nineteenth century and in business and in economics only since the beginning of the twentieth. But economics was thoroughly familiar with the concept of efficiency before it took over the term from engineering and business. The concept occurred in embryonic form in Adam Smith, who made clear in the opening paragraphs of his *Wealth of Nations* (1776) that he was addressing himself to the problem of how the produce of "the annual labour" of a

nation could be made to bear the largest possible "proportion to the number of those who are to consume it." But Smith did not analyze the problem of costs thoroughly and he did not examine the problem of minimizing cost. The classical economists, as utilitarians, not merely sought to explain economic phenomena in terms of men's efforts to seek pleasure and to avoid pain but also attempted to discover the form of industrial organization and the economic policies which would enable men to achieve the maximum return with a minimum outlay. In most of the work of the classical economists, however, the concept of efficiency is taken for granted rather than given explicit formulation. Jevons, on the other hand, undertook to develop a "mechanics of utility," and although he did not use the word "efficiency" he described the problem of efficiency as the central problem of economics.

The earliest technical use of the term efficiency occurred in mechanical engineering, where it was applied to the performance of prime movers and machines. The application of the term to human performance followed the realization by leading members of the American Society of Mechanical Engineers that output was affected by methods of wage payment as well as by technical proficiency. The foundation of modern scientific management may be dated from F. W. Taylor's paper *A Piece Rate System* (London 1895; reprinted in *Two Papers on Scientific Management*, London 1919), in which he described his pioneer method of establishing standards of job performance at the Midvale steel plant. When such standards were set, it became customary to refer to the ratio of actual performance to the standard performance as the efficiency of labor, a use somewhat different from that of the mechanical engineers, who apply the term to the ratio of actual output to an actual input.

Shortly after the turn of the century there suddenly developed a popular efficiency movement on the basis of the application of the methods of systematic research to the problems of business operation. The development of cost accounting during the last two or three decades of the nineteenth century, together with the use of time and motion study, provided two techniques capable of measuring the effectiveness of managerial policies and methods of production. The impressive results yielded by the early researches into administrative procedure commanded extraordinary interest throughout the

industrial world. Enormous publicity was given to its possibilities when, during hearings before the Interstate Commerce Commission in 1910, Louis D. Brandeis introduced industrial engineers who testified that the railroads could reduce costs \$1,000,000 a day by the use of scientific management. This was the first use of the latter term, which has gradually supplanted the term efficiency as the symbol for the movement for business research. The pioneers in this scientific management movement were F. W. Taylor, whose important *Principles of Scientific Management* (New York) appeared in 1911, Harrington Emerson and H. L. Gantt. In 1912 the Efficiency Society was organized in New York City with the broad aim of "promoting efficiency in the various activities in which man is engaged." Its membership included many educators, economists and publicists as well as business men. Almost simultaneously the Taylor group of engineers organized the Society to Promote the Science of Management, now the Taylor Society. By 1913 it was possible for Charles Buxton Going, editor of the *Engineering Magazine*, to say that efficiency had become a catchword everywhere.

The application of the idea of efficiency extended from business administration to individual development and political performance. Luther Gulick's *The Efficient Life* (New York 1907) was a forerunner of popular interest in health and psychology. Josephine Goldmark had made the first important study of industrial hygiene, published as *Fatigue and Efficiency* (New York 1912). At the same time a widespread demand arose for reform in public administration with emphasis on budgetary control of expenditures. Between 1912 and 1914 the United States government and thirteen states established bureaus or commissions of efficiency and economy. Morris L. Cooke, one of the most distinguished of the original Taylor group of industrial engineers, became director of public works in the Philadelphia reform administration from 1912 to 1915. He was one of the first to employ experts in the conduct of public affairs. The introduction of the city manager form of government dates from this period. At this same time the applicability of the concept of efficiency to agriculture and to the household led to the growth of the farm management and home economics movements.

The efficiency movement early aroused the intense opposition of organized labor. The reasons for the opposition were various. All unions,

even those which favored piecework, were opposed to bonus systems under which compensation did not rise in proportion to output, and which therefore were regarded as rate cutting devices. The claims of increased output which efficiency engineers made for their methods caused unionists to associate efficiency with speeding. The craft unions feared the destruction of their trades by specialization and by the substitution of instruction cards and standard practises for the workman's knowledge and skill. Most important of all, the unions feared and resented the claim of some engineers that scientific research could eliminate most if not all of the necessity for collective bargaining. As a result of labor influence the House of Representatives on August 21, 1911, appointed a special investigating committee to study the Taylor system in the government arsenals. Later Congress prohibited the making of further time studies on government employees. In 1914-15 the Federal Commission on Industrial Relations appointed Professor R. F. Hoxie of the University of Chicago to investigate the claims of the efficiency experts and to study their methods in operation. Possibly as a result of Professor Hoxie's report, which is summarized in his *Scientific Management and Labor* (New York 1915), and also as a result of the great economic strength of labor during the World War the industrial engineers have abandoned their extreme claims on behalf of time study and conceded the need for collective bargaining. At the same time they are giving more attention to personnel administration and industrial hygiene. The war labor problem focused the attention of many engineers upon the problems of industrial morale and led them to appreciate the fact that friendly labor organizations might become managerial assets. In their turn some of the more far seeing trade union leaders have realized that labor might benefit by cooperating in the application of the principles of scientific management.

Since the war the concept of efficiency has acquired both wider currency and a vaguer meaning. It has been applied not only to the organization of single plants but to the elimination of waste throughout industry and the community at large. It has been used as a slogan in arguments as to the relative merits of small and large scale, public or commercial operation of business. To many people the term has come to symbolize the methods of mass production and machine technique which have had their greatest development in the United States. In this

sense efficiency has become a goal of the statesmen of Soviet Russia as well as of the engineers of Japan and South America. It has been used as a justification for the replacement of representative government by dictatorship. At the same time the term has been subjected to increasingly critical analysis. An efficiency which leads to periodical crises and unemployment stands self-condemned. In recent years there has been evident among many groups a tendency to talk in terms of rationalization and national or international planning as substitutes for or supplements to efficiency.

The tremendous emphasis on efficiency and the widespread use of the term in the sense of business or pecuniary efficiency have obscured the real nature of the term and created the popular belief that efficiency is desirable per se. Hence it has been accepted as an indictment of trade unions to say that they are opposed to efficiency or of public operation of industries to say that it is inefficient. Strictly speaking, efficiency is a purely abstract and colorless term. It relates simply to the ratio of results achieved to the means used. It follows that there is no such thing as efficiency in general or efficiency as such—there are simply a multitude of particular kinds of efficiency. Actions and procedures which are efficient when measured with one measuring stick may be inefficient when measured with a different measuring stick. Consequently it is no more true to say that trade unions are opposed to efficiency than it is to say that business men are opposed to efficiency. The two statements are equally true and equally false, for both trade unions and business men favor some kinds of efficiency and oppose other kinds—but not the same kinds. From the point of view of the business man that method of production is most efficient which yields the largest output at the lowest money cost; from the workman's standpoint that method is most efficient which yields the largest output at the lowest cost in terms of fatigue, monotony, accidents—the lowest human cost. Just as trade unions do not hesitate to oppose methods which reduce money costs at the expense of human costs, so business men often oppose methods which reduce human costs at the expense of money costs. Among the almost numberless kinds of efficiency three stand out as of particular importance: engineering or physical efficiency, the relationship between physical quantities consumed and physical quantities produced; pecuniary or business efficiency, the relationship

between dollars spent and income obtained; and social or human efficiency, the relationship between human costs incurred and human satisfaction or benefits produced.

EFIMENKO, ALEXANDRA YAKOV-LEVNA (1848–1919), Russian economic historian. Upon completing her secondary education Alexandra Efimenko taught school in Kholmogori in the province of Archangel. The work on local historical records which she began at this time under the influence of her husband, Peter S. Efimenko, a well known student of indigenous legal customs, opened for her a career of historical research which soon engrossed her entire attention. In 1907 she was appointed professor of Russian history at the St. Petersburg school for women of university rank. She was killed during the civil war by a peasant mob in the Ukraine.

Alexandra Efimenko's work was inspired by an idealization of folk justice, and she stressed particularly the importance of the labor principle in the local customary law. Her writing possessed a degree of literary charm rarely found among academic historiographers. Her most important contribution is a collection of essays on land tenure in the north, *Izsledovaniya narodnoy zhizni* (Studies of folk life, Moscow 1884). A study of private deeds of Archangel convinced her that northern land tenure in the

sixteenth and seventeenth centuries was based on the principle of owning ideal shares to which corresponded the actual possession of strips in the several fields of the village. This system of share ownership developed later in some localities into a form of private property vested in the family and in others into communal land tenure with periodic redistributions. Her work on southern Russia, *Yuzhnaya Rus* (2 vols., St. Petersburg 1905), was based in part on original investigations of church brotherhoods in the south and west in relation to land tenure and of the forms and procedures of folk tribunals, but most of her writing on Ukrainian history remained on the level of a brilliant compilation. This is true also of her *Istoriya ukrainskogo naroda* (History of the Ukrainian people, 2 vols., St. Petersburg 1907), which went through several editions.

EGERTON, HUGH EDWARD (1855-1927), English historian. Egerton was educated at Rugby and Oxford and called to the bar in 1880. In 1885 he was appointed assistant private secretary to Edward Stanhope, M.P., who in 1886 became secretary of state for the colonies in Lord Salisbury's government. His interest in the colonies thus awakened, Egerton devoted all his spare time for several years to research in colonial history. Its results appeared in his *Short History of British Colonial Policy* (London 1897, 8th ed. 1928), a book which proved his mastery of a field which historians had hitherto neglected. Other books followed and when in 1905 Alfred Beit endowed a new chair of colonial history at Oxford, Egerton was called by common consent to be the first professor. Neither his lectures nor his books, except his first, were very popular; but he exerted, none the less, a profound influence on the study of the British Empire. Both lectures and books were models of industrious scholarship and cool academic judgment, which appear at their best in his published course, *The Causes and Character of the American Revolution* (Oxford 1923). Thus he gave the new chair at its outset a tradition of solid learning in a subject which lent itself all too easily to superficial or partisan treatment; and it was largely due to him that serious students of the history and problems of the empire could free themselves from the suspicion of political propaganda. In his later phase, moreover (e.g. in

British Colonial Policy in the Twentieth Century, London 1922), Egerton, although conservative by upbringing and instinct, showed an understanding of the post-war development of inter-imperial relations and likewise a reasoned sympathy with dominion nationalism which deeply influenced the wide circle of his pupils, friends and readers.

R. COUPLAND

EGGLESTON, EDWARD (1837-1902), American novelist and historian. Suffering from ill health in childhood, he was largely self-educated and in his adult years followed a varied career as Methodist circuit rider, journalist, editor, novelist, biographer, resident clergyman and historian. His widely read novel, *The Hoosier School-Master* (New York 1871), was the first to exploit realistically the literary materials afforded by mid-western pioneer life. This was followed by other novels, *The Circuit Rider* (New York 1874), *Roxy* (New York 1878), *The Hoosier School-Boy* (New York 1883) and *The Graysons* (New York 1887), which portray with greater literary skill a similar background. The historical labors which occupied his later years were colored by this preoccupation with the life of common folk and by his removal from the middle west to New York, where he was better able to obtain a comparative view of American civilization. In 1880 he projected a comprehensive *History of Life in the United States*, only two volumes of which, however, were completed before his death: *The Beginners of a Nation* (New York 1896) and *The Transit of Civilization from England to America* (New York 1900). Written at a time when American historians of the new scientific school envisaged history mainly as "past politics," these volumes offered a rich synthesis of colonial life in its varied aspects as affected both by its European background and its American environment. Compared with the contemporary historical work of J. B. McMaster, who was animated by a somewhat similar ideal, the material in Eggleston's volumes was more philosophical, less political, better digested and more gracefully written. The fullest formulation of his historical creed appeared in his address as president of the American Historical Association in 1900 under the significant title "The New History" (in American Historical Association, *Annual Report for 1900*, 2 vols., Washington 1901, vol. i, p. 35-47). In this he adjured historians to neglect "drum and trumpet history" for a conception more vital, "the his-

tory of culture, the real history of men and women."

EGOISM. See ALTRUISM AND EGOISM.

EGYPTIAN PROBLEM. Egypt by virtue of its geographical position has during the last two thousand years provided a fruitful field for the successive operations of Greek, Roman, Arab, Georgian, Turkish, French and British exploiters. It was in turn a province of the Greek Empire, of which it was the art gallery; of the Roman Empire, of which it became the granary; and of the Ottoman Empire, of which it was the gold mine. At the time of its national renaissance Egypt had no national legend, no national literature, not even a national language. The Copts, or "Gypts," the survivors of the ancient Egyptians, belonged to the despised Christian religion and clerical class, and were reduced by Islamic persecution to less than one million—a tenth of which population was Moslem, mostly of Nubian stock and speaking Arabic. The ruling class were Mamelukes, Arnaut Janizaries or Turkish pashas and spoke Turkish.

The system of the Mamelukes (male white slaves) was instituted by Saladin, himself a slave by birth. These slave guards, like the Roman praetorians or the Byzantine Varangians or the Ottoman Janizaries, by virtue of non-assimilation with the native population and by continually recruiting their ranks from the Georgian race, were able to establish themselves as a ruling class which continued to govern Egypt for five centuries. The rise of the Ottoman Empire resulted in a temporary diminution of the prestige and position of the Mamelukes but did not succeed in permanently destroying their political power. Gradually as the Ottoman power declined they recovered most of the influence they had lost.

For centuries these praetorians of the Islamic state barred European expansion eastward. But economic pressure for reopening the direct route between Europe and the East through Egypt at last made further isolation of Egypt from Europe impossible. The wars of the French Revolution and Napoleon's dreams of an eastern empire made Egypt a battle ground between British naval and French military forces. Napoleon organized Egypt as the base for the establishment of an eastern empire, effectively destroyed the

power of the Mamelukes and brought Egypt for the first time into direct contact with western civilization. But his plans ended in failure. The French evacuated Egypt in 1801 and after the British withdrew in 1803 Egypt again became a province of the Ottoman Empire. But these events paved the way for the first steps in the emergence of Egypt as a modern state under Mehemet Ali.

Mehemet Ali was the founder of modern Egypt and he is considered to be the father of the Egyptian national movement. This first expression of Egyptian nationalism was not cultural as in the case of most other national movements of the nineteenth century but military. For Mehemet Ali was himself a foreigner; by sheer audacity and ability he made himself pasha of Egypt in 1805 and both his own rule and that of his successors presented all the characteristics of alien domination. He did, however, organize within the Islamic state the first of the new reconstructed nations of the East and thus established a national tradition for the subsequent and more genuine national movements.

Mehemet Ali is generally described as having Europeanized Egypt. But he was an oriental autocrat; his state was thoroughly Islamic; and his experiments in state socialism were inspired rather from the East than from Europe. When he made himself sole titular landlord, sole tax farmer and sole foreign trader for all Egypt he did so under the authority of Islamic law. His system of state monopolies succeeded sensationally as long as they concerned only marketing, but in respect to production they failed. So long, however, as he controlled them, they gave him an economic basis for a no less sensational expansion of political power. With the aid of French experts he had soon organized an army and a fleet on European models that enabled Egypt to break the Wahabi Empire over Arabia in 1816, to conquer the Sudan, to crush the Greek rising in 1825 and to lead an Egyptian army through ten years of campaigns in Syria and Asia Minor to the walls of Constantinople in 1833. Nothing but the armed intervention of Palmerston and the British fleet saved the reforming sultan, Mahmud II, from his rival.

After Mehemet Ali's death in 1849 European expansion in the latter half of the century made Egypt a diplomatic battlefield between British and French imperialism. Under Mehemet Ali's successors, Abbas (1848-54), Sayyid (1854-63) and Ibrahim (1863-79), the system of monopolies became a cesspool of corruption. Egypt, like

Turkey, Algiers, Tunis, Morocco and Persia, ran rapidly through the early stages of Europeanization—first reconstruction, next corruption and extravagance followed by foreign control, financial and then political. Under Sayyid the French were dominant and de Lesseps secured for them the construction of the Suez Canal; this although a vast benefit to the world was disastrous to Egypt. His successor Ismail succeeded in making Egypt practically independent of Turkey and acquired the title of khedive in 1873. But on the other hand he pawned Egypt to European financiers for loans from the Goshens in 1862, 1864 and 1866, from the Oppenheims in 1873, the Bischofsheims in 1870 and the Rothschilds in 1879. Never was there such a spoiling of the Egyptians. Then ensued the usual series of debt commissions and controls, in which the British took the lead. The Anglo-French dual control of 1876 did not take long to cause Ismail's deposition in favor of Tewfik (1879-92).

The last quarter of the century was characterized by the growing ascendancy of the British over the French and by a growing antagonism between British alien authority and native nationalism. This nationalism was composed of three elements—an Islamic renaissance led by Jamalal-Din and Mohamed Abdu, a Europeanizing constitutionalism led by Sherif Pasha and Nubar, and a purely Egyptian reformation led by the fellah Arabi and other officers. This Egyptian reformation came into collision with Anglo-French imperialism, by which it was completely misread and misrepresented. The French pushed matters to a rupture between European imperialism and Egyptian nationalism but after a change of government declared against active intervention, and the British Liberal government found itself forced by financial interests and imperialist opinion into armed intervention. A British army under Wolseley landed in Egypt in 1882, scattered the forces of Egyptian nationalism and definitely established British occupation of Egypt. Egypt was not annexed to the British Empire, but an arrangement was worked out whereby its status as an autonomous province within the Ottoman Empire was preserved, active control to be exercised by the British consul general, who ruled in the name of the khedive.

The first Egyptian nationalist movement having thus failed, the British set about the restoration of Egyptian finance in the interest of the foreign bondholders. That Egypt was saved

from bankruptcy and restored to prosperity is due as much to the industry of the native peasantry as to the intelligence and integrity of such British proconsuls as Cromer and Dufferin. By 1886 the budget was made to balance and, although the sufferings of the peasantry from excessive taxation were severe at first, by the end of the century they were sharing in the general prosperity. But the British throughout were hampered by the political character of their control, which subjected it to an Islamism and an internationalism both of which had lost vitality. Being merely alien advisers of an Islamic autocracy they were constrained to conserve Islamic institutions intact; while being merely an associate of other powers they were obliged to preserve all the privileges of foreigners consecrated by the Capitulations (*q.v.*), which were exploited by their French rivals so as to impede as far as possible all progress. Indeed, in order to purchase the tolerance of other powers the British had not only to collect their bondholders' extortionate claims but even to extend their "capitulatory servitudes," as, for example, by giving the mixed tribunals an interpretative veto in legislation. The situation was at last simplified by the Anglo-French agreements of 1904, by which in principle the French left Egypt to the British in return for Morocco.

Under these conditions it is not surprising that the constitution planned by Lord Dufferin was not carried into effect and that the political and social education of the Egyptians was neglected in the effort to give them political peace and economic prosperity. In this their success was such that Egyptian nationalism in opposition to British rule only revived with the rise of a new generation. With the young khedive Abbas Hilmi (1892-1914) and with the young journalist Mustafa Kamil nationalism entered a new phase of politicians and publicists. This movement became formidable under Cromer's successor, Sir Eldon Gorst (1907-11), whose policy it was to develop self-government. Unlike the earlier nationalist movement led by Arabi, which was chiefly agrarian in character, this second phase was an expression of a growing bourgeois intellectual class drawing its inspiration chiefly from French sources and attempting to use the pan-Islamic movement for its purposes. But this movement never struck deep roots in the country and almost disappeared again under Kitchener, who ruled Egypt as an oriental autocrat.

The World War inaugurated the third and last

chapter of Egyptian nationalism. During the Italo-Turkish War (1911-12) Egypt although still nominally under Ottoman suzerainty had been kept neutral by the British. But when the Turks joined the Central Powers on November 5, 1914, the British riposted with the proclamation of a protectorate over Egypt on December 18. The subsequent campaigns consisted of an unsuccessful Turkish offensive against the canal in February, 1915, an equally unsuccessful British offensive against Gallipoli in 1915 from Egypt as base, a second Turkish offensive against the canal that failed at Kantara in August, 1916, and a final successful British offensive in Syria under Allenby in 1917.

This defense of the canal, the spinal column of the empire, which immobilized as many as 200,000 men in Egypt, combined with war prices for cotton, poured some £200,000,000 into Egypt, about doubled the country's wealth and increased land values about sixfold. But it did not purchase Egyptian consent to the British protectorate. On the contrary, grievances accumulated. The constitution set up by Kitchener as an instalment of self-government, with a representative legislative assembly and provincial councils and municipalities, had been suspended during hostilities. All political activity had been suppressed and the prisons filled with suspects. A fierce and foolish press censorship prevailed. The khedive Abbas Hilmi, a pro-Turk and nationalist, had been deposed and replaced by Hussein Kamil, who was given the oriental title of sultan. The British officials had multiplied fourfold. The commandeering of cattle, camels and corn, the controlling of cotton and commerce, and enforced contributions to the Red Cross all combined to cause discontent. Last but not least came the grant of more self-government to India, which had not contributed to the war in the same proportion as had Egypt.

Post-war Egyptians were moreover very different people from the pre-war effendis and fellahin. The population had doubled under British rule and had grown to thirteen millions. Its wealth had trebled. The old ruling class of Georgian, Arnaut and Turkish landlords and of Armenian and Syrian lawyers had been replaced by the intelligentsia of a professional and commercial middle class of Egyptians. This class had leaders of whom the ablest was a pure Egyptian of fellah stock—Sa'd Zaghlul. No sooner was the Armistice signed than Sa'd Zaghlul requested leave to submit Egypt's case in London, which was curtly rejected, although

the high commissioner, Wingate, supported it, for which he was soon after recalled. As a result Zaghlul united in support of his "Wafd," or "delegation," all political elements for an independence movement. The Wafd in fact became and remains an organization of practically all nationally conscious Egyptians. The only local opposition to Zaghlul disappeared when Rushdi's war government resigned over a dispute with the British as to the new constitution.

Hostilities began with the arrest of Zaghlul and his lieutenants and their deportation to Malta on March 8, 1919. Rioting followed in the chief cities and within a week had become a revolt. Much public property was destroyed and some British officers murdered. But neither then nor later was there any real fighting. Allenby, arriving as high commissioner, soon restored order, released Zaghlul, reinstated Rushdi—and reasserted the protectorate. At once trouble broke out again and Egypt had to be governed under martial law. The Milner mission from December, 1919, to March, 1920, at last recognized Egyptian independence in principle and led to negotiations which broke down rather from mishandling than from misdirection: a draft treaty that gave the Wafd practically all it asked was rejected by the Wafd because it was concluded with a pro-British ministry under Adli. More riots followed and Zaghlul was again deported, this time to Seychelles in December, 1921. The deadlock was finally broken by Allenby's declaration of February 28, 1922. Egypt was therein accorded full independence with four points being reserved for negotiation, viz. the canal, the garrison, the Capitulations and the Sudan. Fuad, who had succeeded Hussein, was then proclaimed king and proceeded to negotiate a constitution with the Wafd.

At the first election the Wafd swept the country and Zaghlul took office in January, 1924. But his negotiations with the first British Labour government on the reserved points broke down over Egypt's claim to the Sudan in September, 1924.

The terrorists in Egypt had meanwhile gone on murdering officials and officers; Zaghlul himself had been wounded by them. But now they succeeded in assassinating Sir Lee Stack, governor of the Sudan and Egyptian commander in chief, on November 19, 1924. The British demanded an indemnity and the withdrawal from the Sudan of Egyptian troops, which had recently mutinied. The indemnity was paid but evacuation refused. Alexandria was accordingly

occupied and the evacuation of the Sudan enforced. Zaghlul resigned, the parliament was dissolved and the king ruled by decree. Egyptian politics thereby entered a new phase, which still continues. The conflict with the British receded and the main conflict came to be between the king and the parliament, the latter represented by the Wafd. Since the death of Zaghlul in 1927 left the Wafd leaderless, the king has gone his own way and in 1930 amended the constitution so as to secure a docile chamber.

The second Labour government of 1929 concluded a fresh treaty with the king's ministers, which conceded all disputed points to Egypt except its claim to the Sudan. The high commissionership has been converted into a diplomatic post and the British garrison is eventually to be transferred to the canal zone.

Under this treaty the Anglo-Egyptian condominium in the Sudan is nominally restored. But practically the Sudan has become a British protectorate and will remain so. There is no racial or regional bond between Egypt and this vast area. The Egyptian claim is one of conquest and has been superseded by its reconquest first by the Mahdi and then by the British. The Egyptians are incapable of governing it, still less of developing it, and their legitimate claim to the waters of the Nile is to be secured by international guaranties.

Jahrhundert, 1798-1914* (Halle 1917); Cromer, Evelyn Baring, *Modern Egypt*, 2 vols. (London 1908); Burns, Elinor, *British Imperialism in Egypt* (London 1928); Newman, E. W. P., *Great Britain in Egypt* (London 1928); Adam, Juliette, *L'Angleterre en Egypte* (Paris 1922); Low, Sidney, *Egypt in Transition* (London 1914); Symons, M. Travers, *Britain and Egypt* (London 1925); Gaulis, B. G., *Le nationalisme égyptien* (Paris 1928); Royal Institute of International Affairs, *Survey of International Affairs*, for 1925, 3 vols. (London 1927-28) vol. i, 189-271, and for 1928 (London 1929) p. 235-84; Foreign Policy Association, "Egyptian Nationalism and British Imperial Interests," and "Egypt, a Decade of Political Development" in *Information Service*, vol. iii (1927-28) no. 11, and vol. vi (1930-31) no. 22.

EHRENBERG, RICHARD (1857-1921), German economist. After working in a bank and a Leipsic book concern and serving for ten years

as secretary of the Altona chamber of commerce he became professor of economics first in Göttingen (1897) and later in Rostock (1899). Illuminated by his thorough knowledge of practical economics his lectures were unusually stimulating. His short books, *Der Handel* (Jena 1897) and *Handelspolitik* (Jena 1900), presented many new points of view and his *Handelshochschulen* (3 vols., Braunschweig 1897-98) influenced the development of higher schools of commerce in Germany. He was of special importance as an economic historian, writing on early modern history and on the development of large enterprises. His *Zeitalter der Fugger* (2 vols., Jena 1896; incomplete translation by H. M. Lucas as *Capitalism and Finance in the Age of the Renaissance*, London 1928) attracted wide interest both in Germany and abroad. At Rostock he studied the works of Johann Heinrich von Thünen, who had drawn for the support of his theories largely from agricultural bookkeeping records. Ehrenberg developed the view that economics could be made an exact science by studying the accounts and other records of individual commercial enterprises. To this end he founded the Vereinigung für Exakt-Vergleichende Wirtschaftsforschung, largely supported by industrialists and landowners, and in 1904 began and frequently contributed to the *Thünen-Archiv* (changed in 1906 to *Archiv für exakte Wirtschaftsforschung*, 9 vols.). Although Ehrenberg sometimes overestimated the reliability of his material and the value of the comparative method he had proposed, his work and that of his students contributed significantly to our knowledge of economic history. He stressed the importance of the entrepreneur, opposed the notion of the class struggle and emphasized the idea of community of interest between capital and labor. He criticized the tendencies of the socio-political school, attacking their methods as unscientific; the hostility which he thus aroused among the socialists of the chair hindered the systematic formulation of his ideas. In later years he occupied himself with agricultural problems, particularly those of land settlement in Germany.

RICHARD PASSOW

Other important works: *Die Fondsspekulation und die Gesetzgebung* (Berlin 1883); *Hamburg und England im Zeitalter der Königin Elisabeth* (Jena 1896); *Grosse Vermögen, ihre Entstehung und ihre Bedeutung*, 2 vols. EHRENBERG, VICTOR (1851-1929), German jurist. Ehrenberg taught at Göttingen, Rostock and Leipsic. His strong social bent led him into the field of insurance law, in which he became the most prominent figure of the past fifty years. He has been called the father of German insurance law. He exerted great influence as a writer of books and articles, as legislative counsel, as adviser to the state insurance supervisors and as private consultant. He and Wilhelm Lexis were the first two directors of the Göttingen seminar for the science of insurance established in 1895. Later he created and directed the institute for the science of insurance in Leipsic University. The German union for the science of insurance enjoyed his cooperation for thirty years. Particularly in the field of reinsurance Ehrenberg may be considered a real pioneer; he was the first German to present a scientific analysis of this internationally significant material. Ehrenberg's contributions extend, however, beyond the sphere of insurance in noteworthy writings on German legal history and on German commercial law. He was the editor of the *Handbuch des gesamten Handelsrechts*, which began to be published at Leipsic in 1913.

EHRENREICH, PAUL (1855-1914), German ethnologist and student of comparative mythology. Ehrenreich after making extended ethnological expeditions to Brazil became interested in folklore and centered his attention upon historical and interpretative studies of mythology. He believed that primitive mythology was an extended allegory of natural phenomena in which mention of the hero's spear, for example, indicated the sun's rays, of warts, the moon spots, and in which test themes represented the setting of the sun and its rising in the east. His extreme allegorical hypothesis has noteworthy adherents,

but more trustworthy mythological investigations now emphasize rather the importance of diffusion and the degree to which the cultural life of a people motivates their tales and is reproduced in them. Ehrenreich's mythological studies, however, were always based on careful comparative abstracts of the tale throughout the area of its distribution and his work on South American mythology therefore remains the great compendium of known distributions in that continent.

Besides his work in mythology Ehrenreich published several linguistic studies on Brazilian languages. He traveled widely in Egypt, India, eastern Asia and the United States. From 1910 until his death he was editor of the *Baessler-Archiv*.

EHRLICH, EUGEN (1862-1922), Austrian jurist. Ehrlich, one of the founders of sociological jurisprudence, received his legal education at Vienna and in 1897 became professor of law at the University of Czernowitz in Bukovina. His European influence was lessened by a contentious personality and by the unreliability of his technical writings. His growing American influence was set back by the World War. Building on the solid achievements of the Germanist historical jurists Ehrlich sought to establish a "sociology of law" which would be for legal practise what medical science is for medical practise. He held that the objectives of such a theoretical science should not be the bloodless provisions of codes which merely tell judges how to decide controversies but the norms of "living law," the unformulated rules of conduct which are recognized in any organized human grouping (*Verband*) as the ones which should be observed and which are usually observed—a distinction he did not always clearly mark. The legal sociologist's first task should be to bring together and systematize the norms of so-

cial groupings which juristic analysis has scattered among a multitude of individual rights and individual duties.

With rare insight Ehrlich sketched in his *Grundlegung der Soziologie des Rechts* the outlines of living law in family, in factory, in commercial groupings. Aware of the dangers of casual observation, he established a seminar of living law and sent his students to investigate the practises and attitudes of nearby communities, using an original but rather primitive personal interview questionnaire. He thus showed, for example, how widely familial customs of diverse racial groups of Bukovina differed from each other and from the supposedly sovereign Austrian code. As other data for the study of living law he suggested the facts of judicial reports and collections of private documents. His influence is seen in the increasing emphasis of legal scholars upon extralegal data and upon studies organized social-groupwise rather than legal-rulewise.

As a leader in the "free-law" movement, Ehrlich traced the fallacies of current juristic logic to the exaggerated importance of the state. Although the state created some law (e.g. as to the army, taxation, social insurance), juristic theory fictitiously assumed that all law emanated from the state, hence that the judge was bound by a preexisting legal rule and thence that the law was a complete, gapless and self-consistent system, affording a single solution of any litigation. Arguing that the legislature furnished a rule of decision only for clashes of interest which it foresaw Ehrlich contended that judicial citation of authority was often rationalization of a decision reached by an intuitive balancing of interests. Juristic logic thus obscured the cardinal fact that justice is guaranteed solely by the personality of the judge. In his preference for judicial intuition and in his glowing emphasis upon living processes as contrasted with logical concepts Ehrlich displayed affinities with Bergson and James.

EICHHORN, KARL FRIEDRICH (1781-1854), German jurist. Eichhorn taught at Göttingen, Frankfurt on the Oder and Berlin. In his academic career there was an interlude during which he served as captain in the cavalry in the War of Liberation in 1813-14. Later because of failing health he was compelled to give up his brilliant career as a teacher and withdraw into the country. In 1832 he returned once more to Berlin but in 1834 he finally had to leave the university. From then until 1847 he held a number of offices, including one of high judicial rank. In the last years of his life after his retirement from service he sank into deep melancholia.

Eichhorn's fame rests upon his *Deutsche Staats- und Rechtsgeschichte* (4 vols., Göttingen 1808-23; 5th ed. 1843-44), in which he laid the foundations of the science of German legal history. The work is the first comprehensive account of the development of German law, based upon the study of original sources, integrating political and juristic history and imbued with the historical spirit. Indeed, after his friend and colleague Savigny had developed the program of the historical school, Eichhorn became its acknowledged leader in the Germanistic field. He joined Savigny in the editorial direction of the journal of the school, the *Zeitschrift für geschichtliche Rechtswissenschaft*, contributing many important articles to its pages. Eichhorn's adherence to the historical school was determined, however, as much by a profound natural feeling of historical continuity as by theoretical views of legal origins. His attraction toward Germanic law was a manifestation of the same impulses that led him to interrupt his work to participate in the War of Liberation.

Eichhorn's masterpiece has long since been superseded. No doubt it had certain weaknesses to begin with, and probably because of Eichhorn's ill health it was not kept up to date. But it long remained unequalled in its arrangement and composition, in its clarity of exposition and in its originality and grandeur of conception, in which historical understanding and constructive power were nicely balanced. Along with Grimm's *Deutsche Rechtsaltertümer* (1828) it laid the firm basis upon which in the nineteenth century Germanistic legal science was brought to a par with Romanistic legal science.

In his other works, in which he sought to give separate dogmatic treatment to some of the branches of law which he had treated historically, there is evident a waning of his early power. The *Einleitung in das deutsche Privatrecht mit Einschluss des Lehnrechts* (Göttingen 1824, 5th ed. 1845) is not as original as his first work but it surpassed the preceding efforts of all others in showing for the first time real historical grasp. It demonstrated the inner relationship between the civil law which happened to be in force at the time and the more permanent basic elements of German law. It thereby led the historical school to further progress. Eichhorn's last work, *Grundsätze des Kirchenrechts der katholischen und der evangelischen Religionspartei in Deutschland* (2 vols., Göttingen 1831-33), showed high scientific qualities but was less successful than either of his other works and was soon outdated.

EINARSEN, EINAR (1868-1913), Norwegian economist. For the greater part of his life Einarsen was engaged in practise as a barrister at law. In 1897-98 shortly after his publication of the *Begrebet kapital i økonomien* (Christiania 1895), a deductive treatise in which he conceived capital as "that part of an economic subject's wealth which is destined to satisfy his future needs," he became assistant professor of economics at the Norges Landbrukshøiskole. In 1904-05 he occupied the same position at the University of Copenhagen. Einarsen's chief contribution to economics was his *Gode og daarlige tider* (Christiania 1904), containing the results of his investigations into the causes of business cycles and based on statistical data relating to Norway, Denmark, Germany and France, particularly during the period between 1859 and 1899. After classifying his data as "common" and "special," according as they represented features characteristic of all these cycles or peculiar to some of them, he dismissed all theories

which were supported only by special data. Thus he found that variations in the quantity of money in circulation could be regarded not as a final explanation but only as a factor modifying the strength of business fluctuations. The actual cause of such fluctuations was embedded in the "paradoxical nature of the value phenomenon," which Proudhon had emphasized. "A rise in values is a sign of greater scarcity, greater poverty; a decline in values a sign of increasing plenty, of growing wealth Therefore depression must by an inevitable law succeed prosperity, just as rain follows sunshine." Einarsen's work, although brilliant and for its time most modern in approach, has never been translated.

WILHELM KEILHAU

EISELE, FRIDOLIN (1837-1920), German jurist. Intending at first to devote himself to theology Eisele studied Semitic languages, the knowledge of which later proved very valuable to him. Turning to the law he entered upon a judicial career and a few years later published his *Die materielle Grundlage der Exceptio* (Berlin 1871), on the basis of which he was called to Basel and some years later to Freiburg, where he remained until his retirement in 1911. Almost without exception Eisele's literary activity was in the field of Roman law, in which his work was extremely varied. But modern scholars in Roman law regard Eisele as especially significant as one of the two founders of the modern interpolation study. His celebrated essay on interpolations, written in 1882 and published in 1886, together with Gradenwitz' book on the same subject in the following year paved the way for what has been the outstanding contribution of the twentieth century to Roman law. Through the identification of stylistic expressions, lexicographical and syntactic peculiarities Eisele showed that much that had been attributed to the classical jurists was the work of Justinian's codification commission; in this and later works he set forth the criteria for the discovery of interpolations, and as a result there is no scientific work of the present day that can omit an analysis of texts from the point of view of interpolation. It does not detract from Eisele's early work that his interpolations had in great part been discovered centuries before by Antoine Favre; Eisele not only rediscovered this method of dealing with the texts but in company with Gradenwitz convinced the scholarly world of its significance.

A. ARTHUR SCHILLER

EISELEN, JOHANN FRIEDRICH GOTTFRIED (1785-1865), German economist. After studying theology and philosophy in Erlangen, tutoring in a noble family and serving in the War of Liberation in 1813-14 Eiselen lectured on political science in Berlin, then became professor at Breslau and from 1829 until his death was professor of political science at Halle.

He published several books, the most important being *Die Grundzüge der Staatswirthschaft oder der freien Volkswirtschaft und der sich darauf beziehenden Regierungskunst* (Berlin 1818), *Die Lehre von der Volkswirtschaft in ihren allgemeinen Bedingungen und in ihrer besonderen Entwicklung* (Halle 1843) and his *Handbuch des Systems der Staatswissenschaft* (Breslau 1828). He wrote little that had not already been propounded by Adam Smith, his only original contribution being an effort to explain the grain scarcity. His attempt to apply the results of economic theory to practical life was altogether abstract; he even ignored the influence of the state on the working of economic forces. The introduction to his work on the Prussian state contains some interesting reflections on the use of statistics in the social sciences; he regarded figures as not altogether to be trusted and he placed emphasis on the significance of imponderables. In his later years he became active politically, serving as member for Halle in the *Herrenhaus*. He also wrote political and historical works, *Preussen und die Einheitsbestrebungen in Deutschland* (Halle 1850), *Der preussische Staat* (Berlin 1862) and *Die Geschichte des lützow'schen Freicorps* (Halle 1841).

Paasche (Jena 1898) p. 1130-82; Inama-Sternegg, K. T. von, in *Allgemeine deutsche Biographie*, vol. v (Leipzig 1877) p. 764-65.

EISNER, KURT (1867-1919), German journalist and revolutionary. Eisner was born in Berlin, the son of a Jewish trader. After studying at the University of Berlin and writing for the *Frankfurter Zeitung* he went to study under Hermann Cohen in Marburg. The Kantian philosophy which he learned there became the basis of his socialistic conceptions. Eisner's socialism had little connection with Hegelian thought; every commonwealth, in his view, must measure up to Kant's ethical ideals in order to vindicate its cultural claims. After nine months in jail for lese majesty he joined the Social Democratic party in 1898 and in a short time became editor of the *Vorwärts* and wrote a series of able editorials, feuilletons and pamphlets. He resigned from the *Vorwärts* in 1905, and wrote *Der Sultan des Weltkriegs* (Dresden 1906), which was a forecast of the World War, and *Das Ende des Reichs* (Berlin 1907), a comprehensive, well documented history of Germany in the period of the French Revolution which tended to deflate the orthodox patriotic estimate of the role of Prussia established by Ranke. In 1907 he edited the Social Democratic *Fränkische Tagespost* in Nuremberg. In 1910 he moved to Munich, becoming political expert and dramatic critic on the Social Democratic *Post*, and wrote a series of articles under the title of "Arbeiter Feuilleton." On the outbreak of the World War he at first took a position opposed to Russian autocracy but with the publication of the German White Book and the entrance of France and England he took a pacifist position which brought him into sharp opposition to the government and the Social Democratic party. He wrote against the war until, in January, 1918, he was arrested in Munich for organizing a munitions workers' strike. Released in October he became a candidate for the Reichstag. He agitated among the soldiers and on the night of the eighth of November led the Munich Council of Workmen, Soldiers and Peasants in proclaiming a Bavarian free state, of which he was the first prime minister. He advocated a policy of Franco-German friendship and international peace and supported the Wilsonian program. Early in February, 1919, he attended the International Socialist Congress in Berne, where he arraigned the official policy of imperial Germany as well as the majority socialists for their support of the war. His domestic policy was never clearly outlined. He relied on the support of the particularist "Bauernbund" and the comparatively small proletariat. The Entente Powers gave him

no backing and his regime, functioning in makeshift manner through a democratic parliament and the Council of Workmen, Soldiers and Peasants, rapidly disintegrated. Nationalistic elements raised a hue and cry against him, erroneously labeling him a traitor to his country, and he was assassinated by Count Arco-Valley on February 21, 1919.

ELDON, FIRST EARL OF, JOHN SCOTT (1751-1838), lord chancellor of England. Eldon was the son of William Scott, a coal factor of means, another of whose sons became Lord Stowell, eminent as judge of the Prize Court during the Napoleonic wars. Eldon gained an enormous practise as an equity lawyer, leaving at his death a personal estate of almost £700,000. He was knighted on becoming solicitor general. He was also attorney general and chief justice of the Court of Common Pleas before his accession to the chancellorship, which except for a short interruption he held for a quarter of a century.

Despite his judicial duties Eldon also played a preponderant role in public affairs during the half century between his entry into Parliament in 1783 and the passing of the Reform Bill in 1832. Beginning his career in politics as one of the "King's friends," he supported the monarchy to the very end. In Parliament he gave a general and independent support to Pitt. As law officer of the crown in the midst of the French Revolution, he became responsible not only for prosecutions for treason and libel but also for such legislation as that between 1793 and 1795 relating to treason, sedition and the suspension of habeas corpus. It was Eldon who advised and supported the seizure of the Danish fleet at Copenhagen in 1807 as well as the British orders in council in answer to Napoleon's Milan and

Berlin decrees. The mutual dislike of Canning and Eldon colored a considerable part of the politics of the period. In nearly every cabinet in which Eldon sat his was the paramount influence. His policy was based primarily on two ideas: his stern opposition to every measure of constitutional and legal reform and his zeal against the Roman Catholics.

It was in the Chancery, however, that Eldon found, both as counsel and as judge, the arena best suited to his special genius; there he displayed to the full not only his zeal in exhausting all possible aspects of a case but his capacity for drawing distinctions and considering niceties and subtleties. He was so notoriously slow and deliberate in the hearing and deciding of causes that the delays of Chancery were sharply and justly criticised. It was, however, not entirely Eldon's fault, for the procedure of the court had long made for dilatoriness and its work was increasing in volume. Some relief was given to Eldon during his second chancellorship by the appointment of a deputy speaker in the House of Lords and the creation of a vice chancellor in the Court of Chancery; but to the very end Eldon was far too slow in the dispatch of cases partly as a result of vacillation in his mind over the correctness of his views, although he was nearly always right in his judgment on questions of equity, few of his decisions ever being reversed.

Within the field of English law Lord Eldon's great achievement was the completion of the system of equity as distinct from the system of common law. During his long career as lord chancellor he reviewed in the Court of Chancery practically the whole range of equity, which, ever since the later Middle Ages and particularly after Lord Ellesmere had vindicated the independence of the Chancery, had been slowly expanded and systematized by successive lord chancellors, notably by Lord Nottingham and Lord Hardwicke. In reviewing equity Lord Eldon decided many of the cases that are now regarded as constituting the judicial foundations of the system, such as, for example, *Howe v. Dartmouth* [7 Ves. 137 (1802)], *Aldrich v. Cooper* [8 Ves. 382 (1803)] and *Ex parte Pye* [18 Ves. 140 (1811)]. Eldon was not, however, an innovator; he devised no new equitable doctrine. The chief significance of his work is that he revised equity and reduced its main rules and principles to a coherent and ordered system capable of further development at the hands of later judges and yet in general unalterable in its

main structure save by the action of Parliament. Lord Eldon's life work as a judge was thus the completion of the historic system of equity. But in the broader realm of the whole English legal system Eldon's unrelenting Toryism long delayed reforms needed as far back as Blackstone's time. It was characteristic of the man that the solitary legal reform which he suggested was the abolition in 1819 of the archaic procedure of appeals of treason and felony and trial by battle. Not until after Lord Eldon's grip on the judicial system had ceased and a new era had been inaugurated by the Reform Act of 1832 was the epoch making legislation of the nineteenth century possible.

ELECTIONS. Election is the process of selecting the officers or representatives of an organization or group by the vote of its qualified members. It is to be distinguished from the alternative methods of selection by appointment or by lot. With the widespread adoption of the initiative and the referendum the term election has, in the United States especially, been extended to the decision by the electorate upon measures submitted to them. While functionally such procedures are more strictly termed direct legislation, they present many of the same administrative problems as the election of officials.

Elections are almost universally used by voluntary organizations or groups—social, political or economic. They are also rather frequently used in church organizations, membership in which acquires a certain compulsion from individual conscience or belief. In the state, membership in which is compulsory, the widespread use of the principle of election has come only with the development of democracy and the recognition of the right of all to share in the determination of policies and the choice of officials. With the spread of democratic government popular elections for public office have come to be practically universally used, although the methods employed, the officials chosen, the frequency

of elections and the regulation by law vary greatly.

The history of democratic elections has been most closely identified with that of representative government. Representative bodies, with a few minor exceptions, have always been popularly elected. The election of executive and administrative officers is not so fundamental a principle of democracy. The kings of Poland, Hungary and, before the nineteenth century, of Germany were elective, while in many modern democracies the people do not elect the nominal or even the actual chief executive. In countries with cabinet government the vote of the people in parliamentary elections determines the general policy of the executive but only within varying limits the actual executive personnel. Even in the United States the city manager movement, which would make the chief executive in city government appointive rather than elective, has shown considerable strength, while the provisions for the recall of public officers, enacted during the movement for greater popular control of public officers, have rarely been used.

Elections for representatives and for executive and administrative officials differ fundamentally in their implications. Representatives need not be experts in governmental affairs or specially trained or equipped. While it is desirable that legislative bodies contain the leaders of the communities, persons qualified by experience and ability, the bodies should be "representative" or typical of the mass of citizens. Their function is to control legislation and governmental affairs in line with the wishes of the majority of the citizens. In the election of executive and administrative officials the voter is not called upon to select someone to represent him but rather to pass judgment upon the ability, integrity and qualifications of the several candidates for each office. Especially in modern society, where the functions of government have grown very technical, special qualifications for these offices have become increasingly important. The average voter is not in a position to make such choices wisely and is forced to rely upon the recommendations of his party leaders, his newspaper, a civic organization or voters' league or upon mere hearsay and rumor. The difficulty of the task is greatly intensified in the United States by the large number of such offices elected at one time—in some states as many as fifty at a single election.

Elections are generally regarded as the ulti-

mate and most important means by which government in general and legislation in particular are subjected to popular control. Yet even in countries where elections are free and fair the ballot box is a very imperfect device for registering the opinion and desires of the voter with regard to his government. He is limited to a choice between candidates none of whom he may want elected or to a yes or no vote upon measures. This limitation of the power of the individual voter finds its frankest expression in the system of parliamentary elections in Fascist Italy. The voters are given the right only of approving or disapproving a full roster of deputies prepared by the Grand Council of Fascism on the basis of nominations made by the various syndicates in Italy.

The nineteenth century witnessed the spread of political democracy and the broadening of the electorate. Between 1800 and 1830 most of the states of the United States abolished property and religious qualifications and established adult male suffrage. The new states admitted to the union practically all came in with adult male suffrage and influenced the older states to abolish their restrictions. Other countries followed the same course although somewhat later. Universal adult male suffrage became the standard basis for elections. Some types of unequal voting were not eliminated, however, until well into the twentieth century. The system of voting under which the electorate was divided into three classes, each of which paid one third of the total taxes and chose one third of the electors, was abolished in Germany only by the Weimar constitution; similar inequalities persisted in Russia until the revolution of 1917 and in Japan until the reforms of 1925. Property qualifications of various kinds persist in many countries. The twentieth century witnessed the extension of the franchise to women in most western democracies. Although the franchise is generally regarded as a public obligation as well as a right, very few countries penalize the failure to vote.

To diminish somewhat the evils of this broadening of the suffrage some countries provided systems of indirect or double election whereby the whole body of voters elect an intermediate body of electors, who in turn elect the officials or representatives. In France members of the National Assembly were elected in this way from 1791 until 1830 and the system is still used for the election of senators. United States senators were elected by the state legislatures until 1913

when popular or direct election was provided by the Seventeenth Amendment; the president and vice president of the United States are nominally chosen by an electoral college, which, however, merely ratifies the popular choice already expressed by the voters. Election of the president by one or both houses of the assembly is provided for in France, Czechoslovakia, Austria and Latvia. Contemporary Russia with its hierarchical system of soviets presents the most far reaching modern example of an indirect system of elections. Indirect elections have considerable theoretical merit but in actual practise they have been attended by many evils. The history of the election of United States senators is replete with cases of bribery, deadlock, political manipulation and distraction of attention from legislative business. The spread of democracy has tended toward the elimination of indirect elections.

Regular elections are held at intervals fixed by the constitution or by electoral laws, at the expiration of the term of the assembly or of particular offices. In countries whose constitutions provide for the dissolution of one or both houses of parliament by the chief executive on the order of the cabinet, on his own initiative or as a result of a plebiscite, general elections for the legislature may be held although the term of office of the parliament has not yet expired. In cases of dissolution the constitution usually provides that the order for dissolution shall set the time for the new elections. In addition to these regular and general elections, special elections or by-elections are held in England, France and many states in the United States to fill individual vacancies in the legislative assemblies. In the United States primary elections are used to nominate the candidates of the several parties and frequently to elect certain party officers.

Elections are sometimes classified as partisan and non-partisan. In the former each person, unless standing as an independent, stands as the candidate of a party, the name of which appears on the ballot after his name or at the top of the column in which his name appears. In non-partisan elections, which are widely used in the United States for municipal, judicial and school officers, no party designations appear on the ballot. The theory of such elections is that national party lines and issues should play no part in local elections, and that the voters should choose on the basis of the fitness of the candidates alone. Non-partisan elections have gener-

ally although not uniformly resulted in freeing the offices involved from party influence.

Ordinarily the candidate receiving the highest vote is elected, or in case of a number of candidates to be elected the highest on the list to the number required. To this plurality system has been raised the objection that when the candidates are numerous those elected may receive only a small percentage of the votes; this is true particularly of the direct primaries in the United States, but it applies also in final elections in multiparty countries without proportional representation. To overcome the objection one of several devices may be used. A second election may be required, at which either a plurality is sufficient or only the two highest candidates (for multiple offices, twice the number to be elected) are permitted to run. This is widely used in non-partisan elections in the United States and in France since 1927 and was common on the continent before the general adoption of proportional representation. In Italy, if the electorate rejects the slate submitted by the Grand Council of Fascism a second election is held, at which a number of lists of candidates may be proposed. In several of the southern states of the United States, where victory in the Democratic party primary is virtually equivalent to election, a second or run-off primary between the two highest candidates is provided. Because of the expense and inconvenience of a second election a number of states have adopted the preferential system of voting, whereby the voter indicates a first, second and third choice. Where the law provides that in case no candidates receive a clear majority of first choice votes no candidates shall be eliminated but the second votes shall be merely added to the first votes, the voters by expressing a second choice may negate their first choice. Under such a system the number marking a second and third choice becomes very small. Many states which adopted preferential voting of this type have now abandoned it. A number of Canadian provinces as well as some countries use the alternative vote, in which the voter expresses a second and third choice. If no candidate receives a clear majority, the lowest is eliminated and his votes transferred as indicated by the second choices; thus the voter's second and third choices are not counted so long as his first choice stands a chance of being elected.

Representatives to legislative bodies may be chosen on the basis of one member from a single-member district (*scrutin d'arrondissement*) or of a number of members from a large district (*scrutin*

de liste). These two types of election have been the subject of much public debate in France, Italy and other European countries. France has changed frequently from one system to the other. Proportional representation is often used with the list system to provide representation for minority groups. Cumulative voting, such as is used in the election of the assembly of the Illinois legislature, aims at the same end. The electoral unit is the three-member district; each voter has three votes, which he may apply as he chooses to one, two or three candidates.

The problems of greatest interest in connection with elections today are administrative, such as election machinery, frauds, ballot laws, regulation of expenditures, registration of voters and election abuses. On these matters the history of elections throws little light. The administration of elections was largely overshadowed by questions of suffrage, democracy and the reform of representation in legislative bodies.

In ancient Greece, judging from the Athenian practise, only a few offices requiring special qualifications were filled by election. All other public officers were selected by lot, which was deemed essential to a democratic government. Voting was usually by a show of hands except in cases of ostracism and in lawsuits, which were decided by a secret ballot or by the use of pebbles. The Roman citizens elected important public officers and also voted upon public measures. At first the vote in the different assemblies was taken by a division; the citizens were counted as they filed past officials. A series of laws between 139 and 107 B.C. provided, however, for the secret ballot to offset the influence which the patricians exercised over the plebs.

During the mediaeval period the practise of holding elections was widely followed, but few details are extant. The suffrage was severely restricted and often looked upon not as a privilege but as a burden. The freemen in the early Teutonic tribes possessed the right of choosing their king, and indirect elections through electoral colleges were used to a limited extent later in the choice of the Germanic emperor. The city of Venice employed a highly complicated system of indirect election of the doge, which involved the use of lottery in the selection of the electoral body. Other communes also used the lot.

The history of elections in England is closely identified with that of the British Parliament. In 1254 when Henry III desired a special contribution for a military campaign in Germany he required each sheriff to see that two knights, good

and discreet men, should be sent from each county to consider what aid should be given to the king. Eleven years later Simon de Montfort summoned a Parliament, calling for representatives from the boroughs as well as the counties. The method of selection of the representatives was not prescribed by statute in the early history of Parliament. Doubtless custom and tradition required a different practise in different counties, and such elections as were held were very informal and irregular. It seems probable that the election was usually conducted at a mass meeting after the sheriff read the writ.

During its early history positions in the House of Commons were not sought after; as their importance increased, the inequalities of representation and suffrage and election abuses became acute public questions. From 1750 until the passage of the Reform Act of 1832 elections for the House of Commons were marked by flagrant bribery, treating and fraudulent practises. In 1872 the Ballot Act was passed providing for the Australian ballot, which had been one of the Chartist demands. Registration laws, corrupt practises acts and a stricter regulation of elections were also enacted.

In the American colonial settlements some public officers were popularly elected almost from the first. The early Virginia charters provided for councils to meet in England to manage the affairs of the colony; in 1621 the council placed legislative power in Virginia in the hands of a council of state and an assembly, the latter to consist of some two hundred burgesses popularly elected. The governor had, however, already called an assembly in 1619 without legislative sanction. In Plymouth a governor and assistants were elected annually beginning in 1620. In Massachusetts the charter of 1628 provided for the popular election of the governor and eighteen assistants, although it appears that the governor was not so elected until 1632. The other colonies, with the exception of New York under the Dutch rule, also provided for the popular election of the legislative assembly and frequently of other officers. Early in American history the number of officials elected was already often quite large.

The method of conducting elections in the colonies was borrowed in large measure from the prevailing practise of England, although variations quickly appeared, particularly in the New England colonies. The details of the administration of elections cannot now be traced with any great degree of certainty, for the actual practise

was not prescribed minutely by statute, as it is now, and what statutes there were on the subject were not always followed.

Elections were in practically all cases conducted by the local officers, such as the sheriff, coroner or mayor. Provision was early made in Pennsylvania for the election of judges and inspectors to assist the sheriff or his deputy, and similar provisions were made in other colonies. By 1634 Massachusetts, influenced probably by the practise in church elections, broke away from the English practise of *viva voce* voting and adopted paper ballots for the election of governor; the neighboring colonies followed. The paper ballot was unofficial and had to be provided by the voter, who usually brought it with him to the polls. The development of proxy voting, which in reality amounted to the division of the colony into towns or electoral districts instead of requiring all the electors to appear at the colonial seat to elect general officers, pointed the way to modern election practise.

There is little information concerning corruption, violence, bribery and fraud at the polls in the colonies. The silence of the statutes on the subject in New England indicates perhaps an absence of these forms of electoral abuse. Most of the other colonies prohibited bribery and other forms of misconduct at the polls and enacted various provisions designed to safeguard the polls against fraud. Bribery was prevalent in those colonies without the paper ballot and constituted in all probability the worst abuse in colonial elections.

Nine of the ten state constitutions framed between 1776 and 1780 required the paper ballot for the election of certain officers, but *viva voce* voting continued in some states, particularly in the south. Arkansas used this form of voting until 1846, Missouri and Virginia until the Civil War and Kentucky until 1891. Nevertheless, abuses under the unofficial paper ballot tended to become fully as great as under *viva voce* voting. Because of the constantly increasing size of the ballot it became the practise for the political parties to print ballots for the convenience of their voters; these unofficial ballots rather than ballots written by the voter himself were held valid in Massachusetts in 1829. Each party printed its ballot upon colored paper so that it could be instantly recognized and bribery made more effective. These abuses led to the widespread adoption of the Australian ballot between 1889 and 1900.

With the rise of large cities following the Civil

War and the influx of immigration election frauds became rampant. As early as 1800 Massachusetts enacted a registration law which was designed to prevent illegal voting. The other New England states followed within a few years, but elsewhere registration laws were delayed until after the Civil War. Between 1860 and 1890 practically all of the states adopted some form of registration of voters, although in a number of states the requirement was and still is limited to cities. The early, weak registration laws were easily circumvented, and repeating and colonization became quite common in the large cities. Stronger registration laws and the creation of special election and registration commissions for the large cities usually tended to clean up the elections for a few years; but eventually these offices fell into the hands of the party organizations and election frauds were again committed with impunity. As late as 1900 it was estimated by well informed observers that as many as 60,000 fraudulent votes were cast in hotly contested elections in Philadelphia.

Since 1900 the tone of elections in the United States has very definitely improved. This has been brought about by stricter registration laws, more detailed regulations of the conduct of elections, the requirement of the signature at the polls in many states and in recent years by the enfranchisement of women and the passing of the open saloon, both of which have tended to prevent violence, drunkenness and corruption at the polls.

While elections in the United States are for the most part honest, they are not capably handled. Every election contest brings to light gross inaccuracies, irregularities and slipshod practises. Cumbersome and antiquated administration makes the cost of elections in many American cities exorbitant. The election costs in 1929 in New York City, for example, were \$2,187,925.18, an average cost of \$1.26 per vote cast; while this cost is high, it is not as great per vote cast as that in some other cities. That these costs are excessive is shown by the very low cost in certain smaller cities. Salt Lake City recently conducted a city primary and election with a total vote of 52,137 at a cost of \$5,270.49, or ten cents per vote. Costs can be reduced and the handling of elections improved by eliminating spoils politics, increasing the size of voting precincts, reducing the number of precinct election officers and simplifying the procedure at the polls.

By custom and in many states by law the conduct of elections is turned over to the two party

organizations, which name all the election officers. This practise has grown up because of the bipartisan tradition and because of the belief that the most effective way to secure honest elections is to provide for official representation of both political parties in the conduct of elections. The practise has proved ineffective. In many large cities the theory that the two parties are opposed to each other is largely a fiction. Appointments are made not for ability or integrity, but on the basis of party service. The patronage of these positions is very great because of the large number of persons required and is used by the party organizations to build up their strength. Election positions are frequently awarded to the bitterest partisans, who are personally interested in the outcome; the vast majority of election frauds are committed by the election officers themselves. In the sections of the country where elections are best conducted the officials are appointed without regard to the recommendation of the party machines and in a few states without regard to party affiliation.

For polling purposes the constituencies and governmental units are in practically all countries divided into election districts, each with a separate set of election officers. Occasionally, as in Lithuania, the districts are determined by a maximum distance from the voters' homes; usually, however, division is on the basis of the number of voters in the district. In some cities in the United States the average number of voters to the election district or precinct is as low as 200, in others as high as 1000. The number of precincts in the largest cities runs into the thousands. With improved transportation facilities and the widespread use of the automobile such small precincts are no longer necessary in the United States, but they are retained largely for political purposes.

The polling place is generally located in or near the election district and is usually in a public building, such as a school building or a fire station. In some communities in the United States private shops (particularly tailoring and cleaning establishments) are rented for the occasion. Occasionally churches or private residences are employed. Rent for polling places was formerly a source of considerable spoils for the political machine, but the failure of the rental paid for polling places to rise with rents in general has made this a less profitable source of spoils. A few cities, particularly Rochester, Cleveland and New York City, use portable houses, which are set up prior to the election upon vacant lots or in

the streets. Public buildings, especially school buildings, are the most satisfactory polling places. The cost is nominal; the polling place is always located in the same place and the space, light, ventilation and general surroundings are better than in rented shops. Where the state law does not require that the polling place be within the boundary of the precinct, many cities locate a number of polling places within a single building. In some European and Canadian cities the voting for the entire city takes place at one polling place—a large hall with a number of polling divisions. This makes possible a more careful supervision of the conduct of elections.

Elections are advertised by notices published in the newspapers and posted in the election districts before the elections. In a few states in the United States this notice takes the form of a reproduction of the ballot. In Lithuania and in the canton of Zurich, Switzerland, every elector receives, five days before the election, the different party lists, one of which he deposits in the ballot box on election day; generally he receives the official ballots only in the polling place. Elections usually last only one day; Lithuania and Egypt are exceptions to the rule. By custom Tuesday has come to be used generally in the United States; Sunday is the most common day on the continent. In many American states election day is a legal holiday on which banks and public offices are closed. In some states and countries the laws provide that all employers shall permit their employees time off during the day in order to vote. The hours of election are fixed by statute, usually from six or seven o'clock in the morning until from five to eight o'clock in the afternoon. Late closing gives the workers a chance to vote and obviates the necessity for costly holiday or time-off provisions. At the close of the election the ballots are counted in the presence of authorized watchers of the political parties or the candidates, and a tabulation of the vote, along with the ballots and other supplies, is returned to the officer in charge. In the principal elections in the United States the precinct officials may have to work most of the night to complete the count; because of the long ballot and the general incompetence of election officials mistakes in the count are quite common.

Voting machines, which eliminate the tedious and often inaccurate count, were first used in the United States in 1892 in the city of Lockport, New York. In 1896 Rochester experimented with them and within a few years they were widely adopted in the state. The voting machine

now generally in use contains ballot labels on its face corresponding somewhat to the printed paper ballot. The voter indicates his choices by pulling down levers or keys, which are connected with counters in the back of the machine. At the close of the polls the election officials unlock the cover of the machine and read off the totals recorded on the counters. The machine is set to prevent the voter from voting for more than the right number of candidates or more than once. A series of locks and seals protect the machines against tampering, and the keys controlling the inner mechanism of the machine are retained by the custodian at all times and are not turned over to the precinct officers. The merits of the voting machine are accuracy, avoidance of the tedious count, economy in the hours of election officers and in the number of officers required, quick returns and the virtual elimination of expensive recounts. The objections to voting machines are the original cost of installation, which amounts to over a thousand dollars per precinct; the dislike for them felt by some voters; the danger of their going out of order; and the cost of storage, of setting for an election and of drayage. Machines are used practically throughout New York state; they are in use in Connecticut, Indiana, Pennsylvania, Wisconsin, Iowa, Washington, California and Michigan chiefly in the more populous cities; Ohio has authorized their use. A number of large cities including Chicago, Jersey City, Newark, Milwaukee, Minneapolis, Denver, Salt Lake City and Portland, Oregon, have tried out voting machines and have abandoned them for a variety of reasons.

Despite the implications of the common expression "ballots *vs.* bullets" elections have frequently been the occasion for resort to violence rather than peaceful persuasion. This is true not only of politically backward countries, such as Egypt and Poland; as late as 1868 the nomination at Blackburn, England, was marked by fighting, while elections in some sections of the United States still result in occasional sluggings, kidnappings and even killings. Occasionally a great power may act as policeman for the elections of less advanced countries, as the United States in Nicaragua. The League of Nations has been called upon by minorities to protect them against electoral violence and oppression, as in the case of the German voters in Poland in 1931.

Provision is usually made for contesting the validity of the election or the accuracy of the returns. In the United States a recount is generally allowed at the demand of a defeated

party or candidate, but in a few states the law requires that before a recount will be ordered fraud must be proved before a court. Since it is usually impossible to do this without opening the ballot box, such provisions make recounts virtually impossible and permit the precinct election officers to make fraudulent returns with impunity.

Aside from the problems of administration certain larger problems in connection with elections have attracted attention within recent years. It is increasingly recognized that the long ballot defeats the very purpose of elections by imposing upon the voter an impossible task. The tendency throughout the United States is to shorten the ballot by making administrative officers appointive instead of elective. This requires amendment of the state constitution in many cases, a difficult proceeding. No country except Switzerland approaches the United States in the frequency with which the voter may be called to the polls. In some states in the United States as many as six elections may be held within a single year. There is a definite trend toward fewer elections, secured largely through increasing the term of public officers. Another trend is toward the separation of national, state and local elections, in order that local elections shall not be overshadowed. These trends are somewhat opposed to each other; much remains to be done toward a definite grouping of elections so that the voter will not be called upon more than once or twice a year to cast his ballot and will not be called upon to elect officers for various governmental units at the same time.

ELECTRIC POWER. The production of electricity on a commercial scale is comparatively recent; it dates from about 1880, and only after 1910 did electric power begin to penetrate the general economic structure of the world. One can distinguish three main periods in this development: a largely experimental period covering the years 1880 to 1910; a period of development and penetration from 1910 to 1920, when industrial enterprises tended more and more to use electric power in preference to any other form of energy; and a period of very rapid expansion, when the conversion of manufacturing processes to the use of electric power was accelerated and the industrial and economic expansion of the principal countries became more and more dependent on the increase in construction and equipment required for the production of electricity or the utilization of electricity in industrial enterprise. This third period, which includes increasing electrification of the home, covers the years 1920 to 1930 for the most advanced countries; namely, the United States, Canada, Germany, Switzerland, Italy and to some extent also Great Britain, Holland, Belgium and Russia. A fourth period has probably set in when, the work of conversion to electricity being complete, electricity consumption will be dependent on the general economic advance or regression of the principal industrial countries.

In the early years of development electricity came into competition with other forms of power already strongly established, and its advance was dependent upon its capacity to take hold of new enterprises arising from the growing industrialization of the world. On a purely cost basis it could not at this time compete with the direct transmission of power from steam reciprocating and similar engines, and its use was confined to special applications where the service electricity performed had a value independent of price. The principal service in this category was that of illumination, and so the first power plants were devoted almost exclusively to the provision of electric power for lighting. They were usually extremely small units serving limited areas. The demand on generating plant for lighting pur-

poses was spasmodic and unevenly distributed and was concentrated in certain periods of the day and year; supply plants had to be equipped for the maximum demand, or peak load, while average demand, or load factor, was only 10 percent, resulting in much idle capacity and high overhead costs and rates. For these and other technical reasons production in large volume could not be undertaken; this circumstance explains in some measure why the technique of electric power transmission and distribution did not develop with greater rapidity. To alter the situation it was necessary to raise the load factor by combining fluctuating demands, and this could be done only by increasing and diversifying consumption and by interconnecting central stations to distribute and level the peak loads. Something was accomplished in that direction by the growth of electric traction.

During this period not only was growth of demand for electricity slow but it was confined to the large centers of population, and the only three countries of any importance electrically were Great Britain, Germany and the United States. The chief influence in the growth of electricity supply continued to be electric light and traction, supplemented by slowly increasing industrial demands. One factor retarding expansion was the comparatively slow rate of world economic advance which characterized these years. From 1910 onward, however, a change took place in the situation. The depression of 1908 and 1909 had given way to an upward movement in industry generally and the improvement in the world situation encouraged the installation of new manufacturing capacity, especially in the United States and Germany; electricity was given its first great opportunity to penetrate industry and open up a whole range of potentialities which had not been previously considered. Technical advance, especially in the design of large generating units and in the utilization of water power resources, pointed to a better conception of the principles governing main transmission; and the control of electrical energy brought the electrical industry into closer contact with industrial requirements, cheapened the cost of power and destroyed in this way many of the obstacles which had held back electrical progress. Manufacturers increasingly recognized the economy and efficiency of electricity; it was clean and noiseless, it freed the upper part of the factory from belts and shafts, improving light and ventilation, and it permitted more efficient arrangement of machines

with individual motors, easily adjustable speeds and better routing of material. After 1914 practically all the increase in factory power equipment in the United States was in the form of electric motors. A whole series of industrial processes arose which used electricity in the process itself and not simply as auxiliary power, as in the electro-chemical and electro-metallurgical industries.

In addition, power finance stimulated electrification, principally in the United States, Germany and South America. Power finance had always been a factor governing the growth of the industry because of the fact that from the beginning electrical manufacturing interests saw that some special support would be required if the industry were to be expanded to its full economic potentialities. Electricity supply companies, especially in Germany and the United States, came under the control of electrical manufacturing interests and their banking affiliates working through power finance groups or holding companies, and it was on this basis of financial penetration coupled with control that Germany and the United States were able to develop a great part of their export trade in electrical products, notably in the East and in South America. From 1910 onward the combination of technical advance and more effective handling of power finance did much to accelerate electrification, while, in the United States especially, deliberate publicity and advertising campaigns on a grandiose scale were carried out with success. It was during the period 1910 to 1914 that some of the most important industries in Great Britain, such as iron and steel, paper manufacture and chemicals, were converted to the use of electric power, while in the United States the great expansion of industrial production was based largely on the greater availability of electricity at a low price. In Germany progress was so rapid that a position of intensive electrical development in the heavy industries had been reached in 1913.

The World War interrupted this trend and diverted new productive capacity chiefly into war industries thus disturbing the economic balance as between industry and industry in the national and international spheres. In 1920 therefore, when the war period came definitely to an end, there was in most countries excess productive capacity in the heavier industries and incomplete mechanization and modernization in industries producing consumption goods. There had also been during the war period an inter-

ruption in the process of industrialization outside Europe and the United States. The depression of 1921 served to retard the installation of new manufacturing plants, but from 1923 to 1930 an extremely rapid upward movement took place, especially in the principal industrial countries, because of the necessity for improving competitive efficiency. An increasing tempo of electrification was made possible by more rational methods of electricity production, cheapening of costs and the closer study of economic conditions governing the transmission and distribution of electrical energy. In these post-war years electricity ceased to be a competitor of other forms of power in the sense that it had to struggle against them to define its position. The conviction was general, especially among the managers of the more important industries, that higher competitive efficiency depended on electrification; and the problem was now not so much to convert opinion to the necessity for electrification as to supply industrial executives in a period of severe business fluctuations with the necessary capital to carry out the work of conversion.

The post-war period has been characterized also by the extension of electricity to purposes other than those associated with illumination and with industrial power, above all to domestic uses, commercial lighting and rural electrification. The experience in a number of countries, particularly Switzerland and Italy, with ambitious railway electrification schemes immediately before and after the war led to widespread discussion of the electrification of transport. Railway electrification schemes of considerable magnitude were evolved for such countries as the United States, Great Britain, Germany, France, Italy, Switzerland, Austria, Hungary, Japan, India, South Africa, Australia, New Zealand, Argentina, Venezuela and Brazil. The consummation of this movement toward railway electrification can be found in the report issued in 1931 by a committee of the British government, which recommends as economically justified the electrification of all the main railway transport systems of Great Britain.

These post-war developments produced an extraordinary expansion in the electric power industry. From 1920 to 1930 generating plant installed in the main industrial countries represented a greater capacity than all the plant installed prior to 1920. In the United States the output in 1912 by central electric stations, including electric railways, amounted to 17,600,000,000

kilowatt hours; in 1920 to 44,000,000,000 kilowatt hours and in 1929 to 97,000,000,000 kilowatt hours—an increase since 1912 of 450 percent and of 120 percent from 1920 to 1929. The increase for each year since 1924 has been more than 25 percent of the total output of 1914. In Canada the total water power capacity of all plant installed in 1910 was about 730,000 kilowatts, in 1921 it had risen to 1,080,000 kilowatts and in 1929 to 4,280,000 kilowatts. In central electric stations alone the increase in the output of electricity rose from 5,895,000,000 kilowatt hours in 1920 to more than 18,000,000,000 kilowatt hours in 1929. In Switzerland the capacity of generating plant was in 1910 about 604,000 kilowatts; in 1920, 840,000 kilowatts; and in 1929, 1,690,000 kilowatts. In Great Britain the output of electricity from public supply systems was, in 1907, 1,432,000,000 kilowatt hours; in 1913 about 2,500,000,000 kilowatt hours; and in 1930 about 11,000,000,000 kilowatt hours. No satisfactory statistics are available for France or Italy, but in their case also progress has been at least as rapid as in the United States or in Great Britain. In Germany, according to the German Federal Statistical Bureau, the output rose from 20,308,000,000 kilowatt hours in 1925 to 30,661,000,000 kilowatt hours in 1929.

Electrification has reached the stage where it enters into practically every economic activity in modern society. It has been estimated that more than 90 percent of all the prime movers installed in the world since 1920 have been devoted to the production of electricity. The conversion of world manufacturing processes to electric drive is therefore almost complete. Industrial electrification in 1929 represented in the United States 79 percent of all power used (compared with 4 percent in 1899 and 37 percent in 1914), in Germany about 77 percent, in Great Britain about 65 percent; while in Canada, Switzerland, Italy, Japan, New Zealand, to mention a number of scattered countries, it has now risen to 90 percent and in certain countries, notably in the newer parts of the world, it is responsible for all manufacturing processes. One can establish a world estimate of industrial electrification of about 72 per cent.

Electrification of the home proceeds almost as rapidly as industrial electrification, the tempo varying in different countries. In the United States in 1929 domestic consumers spent \$604,217,000 on electrical energy compared with \$1,212,885,000 spent by industrial and com-

mercial consumers, respectively 31 percent and 62 percent of the total. The balance was accounted for by street lighting and electric traction. Domestic consumers, however, used much less current than the revenue figures indicate, as they paid higher rates than industrial and commercial consumers. As industrial electrification achieves an equilibrium, domestic consumption, especially if encouraged by lower rates, may be expected to increase and account for a larger share of the total output.

Table 1 shows electricity production in 1928, the year for which the most recent reliable statistics are available. For the 26 countries mentioned and China the total plant capacity in 1929 was 98,200,000 kilowatts and the output of electricity 279,000,000,000 kilowatt hours. One can establish for the world as a whole in 1929 a plant capacity in excess of 100,000,000 kilowatts and an output equivalent to at least 300,000,000,000 kilowatt hours. In 1925 the world output as estimated by the German Institut für Konjunkturforschung was 187,000,000,000 kilowatt hours.

TABLE I

THE PRODUCTION OF ELECTRICITY IN THE PRINCIPAL INDUSTRIAL COUNTRIES, 1928

	GENERATING PLANT CAPACITY (in 1000 kwts.)	PRODUCTION OF ELECTRICITY FROM ALL SOURCES (in 1,000,000 kwt. hrs.)
United States	35,400	114,000
Germany	11,102	27,870
Great Britain	8,608	15,600
France	6,850	13,500
Italy	3,740	10,000
Japan	3,878	10,700
Canada *	3,460	16,337
Norway	1,686	8,000
Switzerland *	1,590	3,600
Belgium	1,511	3,725
U.S.S.R.	2,155†	6,465†
Sweden	1,100	4,412
Austria	1,000‡	2,400
Poland	933	2,320
Holland	761	1,501
Argentina	639	800
Brazil	503	1,200
Finland	462	1,333
Hungary	350†	610‡
Denmark *	255†	536

It is difficult to give any reliable estimates of the total capital invested in electricity supply, since conditions vary from country to country. As a general rule water power plants are more costly than steam power plants and predominantly water power countries would show a much heavier capitalization per kilowatt installed than countries relying on steam power. It is, perhaps, best to select a number of representative countries and from them attempt a world estimate.

In the United States, according to the calculations of the National Electric Light Association, the total capital invested in the electricity supply industry was in 1930 \$12,500,000,000, equivalent to \$382 per kilowatt installed. In Great Britain in the year ending March 31, 1930, the total capital invested amounted to £327,070,000, equivalent to \$240 per kilowatt installed. In Canada in 1928 the total capital expenditure was \$956,920,000, equivalent to \$278 per kilowatt installed. Currency depreciation has rendered calculations for countries like Germany, Belgium, France and Italy artificial and untrustworthy as a measure of expenditure in gold values, which in the case of France was for 1928 as low as \$65 per kilowatt installed. However, in countries with a stable currency throughout the post-war period, such as Switzerland, Denmark and Sweden, one finds capital cost per kilowatt of \$163 in Switzerland, \$203 in Sweden and \$455 in Denmark. A fair estimate of a world average would lie between \$230 and \$250 per kilowatt as applied to public stations only. It would probably be slightly less in industrial plants, so that an average of about \$200 can be taken. This would give \$20,000,000,000 as the world investment in the electrical supply industry.

The differences in capital cost are due partly to the capacity of the individual stations, partly to price levels at the periods when greatest progress was made and partly to the predominance of distribution as a factor in total capital expenditure compared with generation and transmission. Both in the United States and in Great Britain distribution has become a very large factor in total cost; generation and transmission alone represent a figure not much in excess of \$100 to \$120 per kilowatt installed. This is a figure which can most usefully be compared with that given for Switzerland, where power is exported in bulk, and also to some extent with that for Sweden, where a very large percentage of the demand goes into electro-

chemical and electro-metallurgical works situated close to the power stations.

Some clue to differences in capital cost is provided by the capacity of individual stations in the different countries. The average plant capacity per generating station ranged from 12,000 kilowatts in Great Britain and 7350 kilowatts in the United States to 785 kilowatts in Norway and 238 kilowatts in Denmark. In countries using water power exclusively, such as Switzerland, Norway, Sweden, Austria and Spain, although the average capacity per generating station is very much smaller than in the large industrial countries, the growth of interconnection and long distance transmission has in some measure brought such small plants into line with the much larger installations from the point of view of economic results.

According to estimates made by the Dresdener Bank in its publication *The Economic Forces of the World* (rev. ed. Berlin 1930, p. 50-51), the total water power resources of the world in 1927, as far as can be ascertained, amounted to 497,000,000 h.p., based on a 90 percent utilization factor. Consideration of figures for separate countries would indicate that this estimate is probably too low. Thus the figure given by the bank for the United States is 35,000,000 h.p., while the last estimate of the United States Geological Survey in 1930 was 38,110,000 h.p. This would bring the total for the world up to 500,000,000 h.p. The estimates for Switzerland, Spain and Italy are obviously too low, those for Switzerland and Spain being given as 4,000,000 h.p. and that for Italy as 3,800,000 h.p. A more reasonable figure for Italy would be probably twice this figure. Insufficient importance is also given to Rumania and Austria, the most recent estimate, 1929, giving the Rumanian resources as 4,470,000 h.p., while the water power resources of Austria are in excess of 3,200,000 h.p. The most important countries are the Belgian Congo with 90,000,000 h.p., Asiatic Russia with 40,900,000 h.p., the United States with 38,110,000 h.p., the French Congo with 35,000,000 h.p., India with 27,000,000 h.p., Brazil with 26,000,000 h.p., European Russia with 21,500,000 h.p., China with 20,000,000 h.p. and Canada with 18,300,000 h.p. In the case of Canada a correction must be made to cover more recent figures, which have been given as 20,347,000 h.p. in the 1930 estimate based on an 80 percent utilization factor. The total capacity actually utilized in the world, without any allowance for reserve plant but

with calculation based entirely on the maximum load, is given as 33,400,000 h.p. in 1927. According to the United States Geological Survey 14,885,000 h.p. were developed in the United States by the end of 1930, while in Canada the developed power was, in the beginning of 1930, almost exactly 4,000,000 h.p. Other countries with a high standard of development are Switzerland, France, Norway, Sweden and Italy. In those countries the more accessible sites have already been developed and, especially in Italy, there has been in recent years a very rapid increase in the installation of steam generating and internal combustion engines.

In Table II is shown the capacity of all water power plants in the principal countries for which statistics are available, the output of electricity

TABLE II
ELECTRICITY PRODUCTION FROM WATER POWER

COUNTRY AND YEAR	CAPACITY OF WATER POWER PLANTS (in 1000 kwts.)	OUTPUT OF ELECTRICITY (in 1,000,000 kwt. hrs.)	EQUIVALENT IN COAL † (in 1000 long tons)

‡ Based on coal consumption per unit generated of 1.8 lb.

Source: Compiled from official sources

from these plants, and the actual equivalent in coal of such an output assuming that 1.8 pounds of coal would have been necessary for each unit developed in a steam power station. Since for these twelve countries, representing about 80 percent of the world's output of electricity, the total saving in coal is no less than 75,000,000 to 80,000,000 (long) tons annually, for the world as a whole one would expect a saving equivalent to about 100,000,000 tons a year. In the case of the United States, Canada, France, Switzerland, Italy and Japan allowance must be made for private industrial plants not contained in these figures; but the proportion represented by such plant would be very small and would probably not increase the estimates already given

by more than 10 percent. One must also take note of the very rapid development of water power in European and Asiatic Russia, regarding which no reliable statistics have yet been compiled. According to the plan of the Soviet Union a whole series of large water power stations are either under construction or completed—in six stations alone a total ultimate capacity of 768,500 kilowatts will be available before the end of 1933.

A further saving of high grade fuel is effected through the consumption of brown coal and peat in power stations. In Soviet Russia, for example, rather more than 30.6 percent of the total electricity production from central electric stations is obtained from stations using peat as a fuel, 2.2 percent from brown coal and 36.1 percent from fuel oil. Russia is the only important country in the world using peat as a fuel in power stations. The two countries which have developed the use of brown coal to the greatest extent have been Germany and Russia. In Germany in the public supply stations alone brown coal plants in 1929 had a capacity of 1,623,000 kilowatts, while in the same year the output of electricity from both private and public plants using brown coal was equal to 10,316,000,000 kilowatt hours, or slightly more than one third of the total national output.

Fuel oil is an important source of power production only in the United States, where about 10,000,000 barrels of fuel oil were consumed in electricity production in 1929, compared with 11,000,000 in 1919. In other countries plants consuming fuel oil are largely used as reserves to take peak loads and to deal with breakdowns in water power systems. The only country in which intensive electrification based on oil has been discussed is Rumania, where it is calculated that, out of a total prime mover capacity of 871,000 kilowatts in 1929, 38 percent were driven by gas and by fuel oil. It is considered probable that oil on a large scale may be used in European Russia within a few years. In the United States, while the use of fuel oil appears to be declining, the use of gas increased from 21,406,000,000 cubic feet in 1919 to 77,174,000,000 in 1929.

The generation of electricity is becoming more and more concentrated in large steam power plants using coal as fuel or in hydro-electric installations connected with centers of consumption by main transmission lines operating at very high pressure. At one time it was thought that electrical development, if it was to

be carried out cheaply and economically, would depend largely on the exploitation of water power resources. Up to the present costs of water power have been lower than those of steam power. For water power plants capital cost decides the total operating cost with only a very small additional running charge to cover maintenance, lubrication and wages. Thus a water power plant costing \$300 per kilowatt installed would have annual capital charges per kilowatt of about \$25 with a running charge probably not exceeding at most .20 cent per kilowatt hour generated. If the hours of utilization per kilowatt during the year amounted to 4800 hours the total cost per kilowatt hour, including capital charges, would be .50 cent plus .20 cent or in all .70 cent. In very large water power installations developed at comparatively low cost a figure of .50 cent and even .30 cent per kilowatt hour is obtainable; and it is this much lower cost that has made economical the important electro-chemical and electro-metallurgical works located in the United States, Canada, Norway, Sweden, Switzerland, France, Italy, Spain and Tasmania.

Hitherto it has been extremely difficult for the steam power plant to compete in cost with such figures. Although in its case the capital cost of the installation may be less than one third of that of water power plant, its operating charges are high owing to the necessity of burning fuel and of maintaining generating units in a high state of efficiency. The total working costs of an efficient modern steam power plant would equal from .36 cent to .40 cent per kilowatt hour generated with capital charges amounting to an additional .20 cent to .30 cent, allowing for an initial capital cost of about \$90 per kilowatt installed and an annual utilization factor of about 3000 hours. Thus the total cost in the modern steam power plant would be at least .56 cent to .70 cent per kilowatt hour. Such a price difference would at present give the advantage to the water power installation, but progress in technique and scientific invention are rapidly increasing the efficiency of the steam power plants. Efforts are being made to improve the overall thermal efficiency of steam power plants, cut down their fuel consumption per unit generated and through concentration in large units cut down the initial capital cost per kilowatt and with it the annual capital charges. Interconnection of steam plants over wide areas serving many diversified industries and commercial activities has eliminated the necessity for a high percentage of reserve plant and

spreads capital charges over a wider output. In a short time much lower figures than those already quoted may be expected.

At the same time developments have on the whole been unfavorable to reduction in cost of water power plants. The water turbine has already been developed almost to the maximum efficiency, while with the fuller exploitation of water power resources the more accessible sites have been used up and it has become more and more difficult to develop projects at a low capital cost. The average cost per kilowatt installed for water power plants is now about \$200 compared with figures as low as \$75 per kilowatt for steam power plants. In addition to this, water power possibilities not yet utilized are less accessible to the centers of population and power consumption and necessitate a greater mileage of main transmission lines. The tendency therefore is for the water power plant to lose its competitive advantages as against steam power plant. In the United States from 1924 to 1928 there was a larger increase in current generated by water power than by fuel, but while the former was stationary in 1929 the latter increased 18 percent; in the same year water power accounted for only 35 percent of the total output of electricity.

Three main tendencies may be distinguished in the production of electricity: steady reduction in the amount of fuel used for a given quantity of electricity; the increased concentration of production in very large units and as a result the widening of areas of transmission and distribution; and the adoption of the principle of interconnection not only between steam power plants but between water and steam power plants, whereby the former will be used to the maximum and periods of greatest demand will be met by the latter.

These tendencies are symptomatic of the trend in all modern industrial organization based on mechanization and rationalization. The most spectacular of the three tendencies is undoubtedly that represented by economies in the use of fuel. Economies in materials are not a feature peculiar to the generation of electricity; and it would be unwise, for example, to attribute the reduction in the utilization of coal merely to electrification. Parallel reductions have taken place in the utilization of coal in chemical processes, in the production of steam for industrial purposes, in railway transport and even in domestic consumption. In electricity, however, by reason of the complete nature of the records

maintained and the simplicity of the final product it is possible to follow year by year the process of fuel economy. This process has been characterized by three important features: the substitution of water power for steam produced power; the construction of very large generating units; and the elaboration of closely interconnected giant power stations.

The economies due to water power development have already been discussed. It remains to give some statistical indication of what economies have been effected in the utilization of coal, by means of research and plant improvement. In 1920, the earliest year for which reliable statistics are available, the average consumption of coal per unit generated in Great Britain and the United States was about 3.2 pounds. In 1930, this figure had fallen to 1.8 pounds—a saving of almost 45 percent in ten years. This saving, if applied to the world production of electrical energy in steam power plants, would represent a reduction in the annual consumption of coal of at least 140,000,000 tons. One must add to that the 100,000,000 tons representing the amount of coal displaced by water power development—a grand total of 240,000,000 tons, equivalent to about one fifth of the present annual coal production of the world.

The construction of large generating units—up to 130,000 kilowatts in a single unit or 200,000 kilowatts in a compound unit—has been a factor of very great significance in this connection. Where a small generating unit of 1000 to 2000 kilowatts would consume from 18 to 20 pounds of steam per kilowatt hour generated, a modern large unit would consume less than 8 pounds, equivalent to about 1 pound of coal. Widespread adoption of the large generating unit has taken place in the United States, where the average capacity per unit of many power stations is in excess of 60,000 kilowatts. In Great Britain the unit capacity adopted for the selected stations in the national power scheme is 50,000 kilowatts and units of 67,000 kilowatts to 75,000 kilowatts are being constructed. In Germany units of more than 80,000 kilowatts are already in operation. A parallel tendency is the increased concentration of production in very large power stations. Even ten years ago a power station with a greater capacity than 40,000 kilowatts might have been regarded as unusually large, but many stations now are several times that capacity. There are power stations with a capacity ranging from 300,000

to 770,000 kilowatts in the United States and from 300,000 to 450,000 kilowatts in Great Britain, Germany and France. In the United States the number of power plants decreased one third, from 6355 to 4335, between 1922 and 1927. This trend has tended to reduce the consumption of fuel; at the same time it has raised a series of new and difficult economic problems.

Concentration of production in such enormous aggregations has made necessary elaborate widespread transmission and distribution schemes, which cover no longer a single town but branch out through the nation. These schemes depend upon the linking up of large or superpower stations and distribution networks by means of high tension transmission lines. There are transmission lines operating at 100,000 volts in Italy, at 132,000 volts in Great Britain and at 220,000 volts in the United States and Canada; in Germany the Rheinisch-Westfälisches Elektrizitätswerk has linked up the Ruhr with Baden by a line at 380,000 volts, the highest in the world. In 1900 it was possible to transmit only 60,000 volts for distances of 50 miles; in recent years it has become common to transmit 222,000 volts for 200 miles and over. The industry is rapidly achieving the transmission of electricity for unlimited distances, perhaps by radio. The increase of transmission efficiency permits high voltage primary transmission from power stations at pressures of 100,000 to 200,000 and more volts to strategic supply points, from which a new series of transmission lines at 60,000 to 100,000 volts covers a much wider area, whence low voltage distribution proceeds to individual consumers. Interconnection, moreover, distributes and levels peak loads, increases the load factor (now as high as 40 percent in the United States) by carrying a more unvarying load and permits lower rates, which are based on average load factor, thereby increasing and diversifying consumption.

It is possible to trace three stages in the elaboration of interconnected systems, all of which illustrate the evolution toward the very large aggregation which is perhaps the outstanding characteristic of electricity supply economics. Originally an undertaking with an area of supply limited to several hundred square miles would link up its generating stations with a view to eliminating interruption of supply resulting from breakdowns. One station would be able to take over temporarily an additional load sufficient to tide over the period of difficulty. In

the most progressive modern power zones this first phase has practically disappeared, because of the centralization of production in very large plants and the development of the composite undertaking consisting of several enterprises merged together under one control. In countries like the United States, where private enterprise is responsible for practically the entire production of electricity, in spite of a measure of political opposition amalgamations or mergers have taken place without serious complications other than those of a financial nature, with the consequence that areas of supply are no longer confined to hundreds of miles, but cover many thousands of square miles.

Interconnection has moved therefore into its second phase; namely, that of the creation of superpower zones where many large plants operating together feed into a widespread system. This widespread system may cover many states without, however, covering the area of an entire country. Examples of such interconnection to cover entire states are provided chiefly by the United States, Canada and Germany. It is impossible to give a detailed account of every superpower zone in the United States, but two main areas may be selected for consideration; namely, the Pacific coast and Michigan and the Great Lakes district. The whole of California is served by two companies. The Pacific Gas and Electric Company extends over 500 miles from north to south with the almost exact center at San Francisco, links up in the north with the Colorado Power Company and in the south near Santa Barbara with the Southern California Edison Company, which centers round Los Angeles, while since its acquisition in 1930 of the San Joaquin system it is linked up with the San Joaquin valley at Santa Maria and taps therefore one of the most important oil bearing areas in the United States. This great Californian power zone has plants with a capacity of 2,100,000 kilowatts and an annual output in excess of 8,000,000,000 kilowatt hours. In the superpower zone represented by Michigan and the district of the Great Lakes the principal undertakings which are linked up have points of connection with other undertakings further to the east and to the north; therefore no particular section can be isolated. Beginning in the north the Detroit Edison Company is linked up with the Consumers Power Company near Lansing in the west and at Cement City in the southwest. In the north it links up at three points with the Michigan Electric Power Company, which cov

ers the area bounding Lake Huron and Saginaw Bay. On the west of Lake Michigan interconnection centers on the Commonwealth Edison Company of Chicago and the Public Service Company of Northern Illinois. The undertaking connecting the Commonwealth Edison Company with the Consumers Power Company is the Northern Indiana Public Service Company, while through a whole series of interconnections it is now possible for Chicago to supply electricity direct to New York. Further east the systems created round Lake Ontario, notably by the Hydro-Electric Power Commission of Ontario and the Buffalo Niagara and Eastern Power Corporation, are also examples of interconnection on the very largest scale. The American Niagara system links up with the Hydro-Electric Power Corporation at Niagara Falls. In the southwest it connects with the Penn Public Service Corporation, on the east with the Adirondack Power and Light Corporation and on the north with the Northern New York Utilities Company. It is also linked up by a series of interconnections with New York. The Hydro-Electric Power Commission, in turn, which serves the whole of southern Ontario with main transmission lines stretching from Pagan Falls in Quebec in the extreme east to Windsor, at that point comes into contact with the system of the Detroit Edison Company, thus almost completing the series of great power systems round the Great Lakes. Further east an important superpower zone covering Quebec includes three systems; interconnection runs from Windsor into Quebec, so that if account is taken of connections round the lakes both on the American and Canadian territories this whole area can be regarded as the most important power zone in the world, with an annual output greater than the total annual production of Canada alone.

In Germany rapid progress has been made toward the formation of one unified power system covering the whole country; four interconnected superpower zones bring almost the entire production from public supply works into one supply system operated by a number of undertakings of a varied type. Two systems may be distinguished in Switzerland, one of which connects with Germany and Italy and the other with France, interconnected for the export of electricity. Italy provides a remarkable example of interconnected zones covering the whole of Lombardy, Venetia and Piedmont, with extensions to Florence, Rome and Naples. In northern and eastern France zones of a similar nature

have been created, the most striking developments being the linking up of the Massif Central with the power stations at Paris and the creation of a superpower zone in the Pyrenees.

The third phase, that of definitely designed national power schemes, the simplification of control and the entrance of the state into the coordination of electricity supply, has already been brought into existence as a logical outcome of the second. In the past few years government ownership of municipal plants has declined steadily because of the development of large generating plants, high tension transmission and superpower zones. But the operation of these same forces has compelled intervention by the state on a national scale extending beyond the regulation of rates, especially as private enterprise has made no attempt to introduce an element of conscious control. This third phase has been rendered necessary by fundamentally conflicting types of power organizations among other factors. In Great Britain private enterprise in the power companies is responsible for only about 37 percent of the production from public supply systems, local authorities and municipalities supplying the remainder. The difficulty of forming an amalgamation of a power company and a local authority would appear to be insuperable even if legislative issues alone are considered, and so a form of coordination has been imposed by the state, largely with the consent of the supply enterprises themselves.

The most striking and most scientifically designed scheme of coordination is that of the "Grid" in Great Britain, which was recommended in 1925 and brought into legislative existence by the Electricity Supply Act of 1926. The work of coordination is entrusted to the Central Electricity Board, a public utility independent of political control or interference but responsible to the ministry of transport, which appoints its executive. This board might be regarded as a compromise between public ownership and private enterprise; in its actual operation and financing it conforms closely to the practise of an efficient private company but is not allowed to make profits and in certain matters bearing on public policy is responsible to the government. The purpose of the national power scheme in Great Britain is to construct a main transmission system operating at 132,000 volts and linking up about 150 selected stations in one unified power zone under centralized control and capable of supplying the entire national demand for electricity from public

undertakings. The concentration of electricity output means closing down about 320 unnecessary and comparatively inefficient stations and a very considerable simplification and standardization in the utilization of selected power plants. Economies effected by such coordination are estimated to bear easily annual charges represented by expenditures on the scheme and cause a considerable reduction in the average price of electricity supply. It is estimated that in 1942 production from the national power scheme will be in excess of 25,000,000,000 kilowatt hours, and such an output may make it the greatest example of interconnection and superpower operation in the world.

A similar scheme of national coordination is to be found in Belgium, where a single holding company has been created to link up activities of other regional coordinating companies responsible between them for almost the entire output of electricity from public supply and industrial networks.

In other countries the state itself has played an important part in the large scale production of electricity. Thus in Sweden state owned undertakings in the central Swedish power bloc are responsible for more than 40 percent of the output of the country, their production in 1929 amounting to 1,900,000,000 kilowatt hours. In New Zealand the state is responsible for almost the entire production from 38 water power stations with an annual output of 710,000,000 kilowatt hours. State coordination of electricity supply has been initiated in Hungary, Egypt, China and to some extent in Japan. In Germany coordination of electricity supply has been carried out partly by the individual states, partly by the German government itself and partly by supply companies in which public authorities have a minority capital holding. The two most important coordinating elements in Germany are the German government, whose undertakings are centralized in one company, the A.-G. für Deutsche Elektrizitätswirtschaft, and the Rheinisch-Westfälisches Elektrizitätswerk. Each of these undertakings is responsible for the control of networks producing annually more than 3,000,000,000 kilowatt hours. It is estimated that in Germany 70 percent of the output of public supply undertakings is controlled by the Reich, the states, the municipalities and communes. The tendency in Germany has been for the state to control generation and transmission, with private enterprise taking care of distribution to consumers; the state and private enterprise oc-

asionally participate jointly in "mixed" companies. In France the state actively assists the electric power industry, particularly in the development of power zones and rural electrification.

Soviet Russia provides another example of a deliberately planned national power scheme under the most rigid form of state control covering generation, transmission and distribution. In a number of countries coordination has been carried out by individual states or counties, notably the Electricity Supply Commission of South Africa, which was created by the Electricity Supply Act of 1922; this organization with the addition of one power company is responsible for almost the entire output of electricity in South Africa. A further example of the same type of organization is that provided by the State Electricity Commission of Victoria in Australia, which was constituted in 1918 and had an output in 1929 of almost 580,000,000 kilowatt hours. Tasmania provides a further example of such coordination, the state hydro-electric department owning a power plant at Waddamana with an output in excess of 300,000,000 kilowatt hours used principally for zinc manufacture. Perhaps the most important example of electrification attempted by a single state is that of the Hydro-Electric Power Commission of Ontario, which has an annual output in excess of 4,000,000,000 kilowatt hours.

In the United States there has been no formation of power zones on the basis of national planning; coordination has been usually determined by competition and has been carried out principally by large financial groups controlling a number of supply companies through a system of mergers, including gas companies as well. The United States especially lends itself to this form of centralization because almost the entire output of electricity is produced by privately owned public supply companies, the local authority or the municipality playing an unimportant part. It is impossible at this stage to discuss fully the American public utility situation (*see* PUBLIC UTILITIES). Briefly, the system is based on the extensive development of power finance, which, as already indicated, originated with the electrical manufacturers but has since become largely independent of them. The concentration of control has been accomplished largely by use of the holding company (*q.v.*), which permits pyramiding of control, and by interlocking directors. The financial interests most powerfully represented in the United States are the Electric

Bond and Share Company, which in 1929 had assets of \$1,210,000,000 and dominated subsidiaries with an output approximately equal to one fifth of the national total. The next most powerful are the Insull group (represented mainly by the Commonwealth Edison Company of Chicago and the Middle West Utilities), the Northeastern Power Company, North American Company and Standard Gas and Electric Company. These five finance, service and holding companies and their subsidiaries, according to the *Electrical World*, controlled in 1927 almost one half of the American electricity output; ten other companies, including two Pacific coast companies, the New York Edison Company and Stone and Webster, Inc., controlled 29 percent. By 1929 concentration was much greater. The Middle West Utilities Company and the Commonwealth Edison Company have an annual output now in excess of 8,500,000,000 kilowatt hours. The organization in 1929 by J. P. Morgan and Company of the United Corporation introduced a new and dominating factor into the power industry. Within one year the new corporation had assets of \$539,000,000; the assets of its subsidiaries and their affiliates exceeded \$5,000,000,000. The United Corporation interests spread along the Atlantic coast from north to south; one of its subsidiaries, the Niagara Hudson Power Corporation, controls 70 percent of New York state's water power resources.

The final centralization of control is accomplished by the great banking houses. J. P. Morgan and Company and their affiliated banks, First National, Bankers Trust and Guaranty Trust, are represented on the directorates of electrical companies (excluding the United Corporation) with assets approaching \$8,000,000,000. The National City and Chase National banks are represented on the directorates of power companies with assets exceeding \$5,000,000,000. Some or all of these banking houses are represented on the directorates of the General Electric Company, the Westinghouse Electrical and Manufacturing Company, the Radio Corporation of America and the American Telephone and Telegraph Company—an integration of interests representing financial control over the electrical manufacturing, power and communication industries.

In Canada two main groups are represented in public utility finance and production, the Holt-Gundy and the Nesbitt-Thomson groups. The total capacity of generating plant owned by these two groups is now about 1,400,000 kilo-

watts, with an annual output in excess of 6,500,000,000 kilowatt hours, or 36 percent of the Canadian output. American interests in Canada are represented predominantly by the International Power and Paper Company, which controls the Gatineau Power Company and in the United States the New England Power Association. Including American subsidiaries this group has an annual output of 3,500,000,000 kilowatt hours.

Power finance and holding companies with their electrical manufacturing and banking affiliates dominate electricity supply in Europe. Although weakened by the growth of public undertakings under state supervision there are important finance companies in Germany under control of the Allgemeine Elektrizitäts-Gesellschaft and the Siemens-Schuckert combine. Important finance and holding companies operate in France, Belgium, Switzerland and Italy; in France one combination controls 70 percent of the output of electricity.

The influence of finance and holding companies spreads beyond national frontiers. Special finance companies are organized for foreign countries by electrical manufacturers to create and control markets for their equipment. Electricity supply in Latin America is dominated by the American and Foreign Power Company, which also has important interests in India, China and Europe. It is a subsidiary of the Electric Bond and Share Company and in 1929 it had assets of \$756,000,000. The International Power Securities Corporation, the American European Utilities Company and Italian Superpower Corporation are American companies which have large interests in electricity supply undertakings in Europe. The International General Electric Company, a subsidiary of the General Electric Company, has interests in German and French electrical manufacturing enterprises which in turn are affiliated with power finance and holding companies. Well over \$1,000,000,000 of American capital is invested in foreign electricity supply enterprises. The leading European electrical manufacturers and their banking affiliates maintain power finance and holding companies for operation in foreign countries. The tendency is for the dominant American and European companies to interlock and define their interests, in many cases working harmoniously together for the elimination of competition.

Consideration of the large power groups and the centralization of control leads inevitably to discussion of the possibility of the creation of

international superpower networks. Such a network is slowly but surely being created between Canada and the United States; in 1929 Canada exported to its neighbor 1,604,000,000 kilowatt hours of electrical energy. But the most remarkable example of what can be achieved is that represented by the Alpine power bloc centering about Switzerland. Recent extensions have made it difficult to confine the bloc even to the Alps, since the extensions of German systems have been such that countries many hundreds of miles away from the Alps have been brought into connection with water power plants operating in them. Electricity is exported by cable from Sweden to Denmark. In 1929 Switzerland, Germany, Austria and France exported 1,450,000,000 kilowatt hours to each other and to Italy, Czechoslovakia and the Saar. The total exchanges for all the countries mentioned would amount to about 3,000,000,000 kilowatt hours, or 6 percent of their total output. In the case of Switzerland its exports of 1,000,000,000 kilowatt hours are equivalent to 27 percent of the national output and occupy a fairly important position in the balance of trade, being valued in 1929 at about 21,000,000 Swiss francs.

The export and import of electricity open up the problem of making power available from countries with large fuel and water power resources to less favored countries, which is bound up with the larger problem of the international flow of raw materials. It also makes imperative unified legislation and standardization. The problem has already produced legislation and treaty conventions among the countries affected, but they constitute only a beginning.

As a consequence of its high degree of mechanization electricity supply is an industry which employs a comparatively small body of men. Output per worker in the United States has increased approximately 300 percent since 1902. This is particularly apparent in the central stations, where the number of employees has shown a steady relative decrease owing to the introduction of more efficient units and of labor saving devices, such as the mechanical stoker in steam plants; in automatic and partially automatic hydraulic plants labor has been almost completely eliminated. There has, however, been a relative increase among outside workers engaged in transmission and distribution because of the expansion of transmission networks, the growth in customers and the fact that comparatively little has been done to introduce labor saving devices except in the case of automatic substation opera-

tion. In 1927 in the United States electric power companies had 95,917 salaried employees and 138,796 wage earners; the average yearly salary and wage was \$1734 and \$1450 respectively. For the industry as a whole wages were smaller than fuel costs and interest payments; in the period 1922-27 the increase in the wage bill was considerably smaller than the increase in net income. Employment is comparatively steady. While the power companies have done much to reduce hazards, these are still high; some of the most important safety devices are not being introduced because of their cost. The linesman's occupation is particularly hazardous, and the increase in high tension lines has offset to some extent the effect of the safety work.

In most of the European countries labor is represented by strong central organizations capable of dealing directly with the employers. In the United States, however, mechanization and concentration have been accompanied by the decline of unionism. The mechanical stoker almost wiped out the central station membership of the International Brotherhood of Firemen and Oilers. The International Union of Steam and Operating Engineers is not representative of the wage earners, the members being under the control of the management. Moreover, neither union has any strength in the power industry. Somewhat stronger is the International Brotherhood of Electrical Workers; its members in the power industry are almost exclusively linesmen and it has made no impression on central station workers. Before the World War power companies refused to deal with unions, but in recent years they have encouraged company unions and engaged in elaborate welfare activities. Employee stock ownership has not been enthusiastically taken up although encouraged by the companies; in 1929, according to the National Electric Light Association, 23,197 employees in companies representing one third of the industry owned only 2.3 percent of the total stock.

Electrical development, through its concentration on large productive units, the interconnection of main transmission lines of such units and the economies effected by technical and scientific advances, has served to create new industrial areas and to give an economic status to countries which previously, through lack of fuel resources, were unable to enter the manufacturing field; it has converted Switzerland and northern Italy, central and southern France, northern Spain and a large part of Norway and Sweden into important industrial regions, many

of them active in the creation and expansion of new industries based on electro-chemical and electro-metallurgical processes. In Switzerland, Austria and Italy electrical development has accelerated the expansion of a number of primary industries, chief among them being textiles and engineering. Cheap electric power plays an important role in the rapid industrialization of the southern states of the American union. Even in countries with fuel resources, such as Canada, the industries which have grown most rapidly have been those which, like paper and pulp, are dependent on a cheap and constant volume of electrical power.

The industrialization of new countries, and among those new countries should be mentioned Japan, New Zealand, Australia, Russia and China, is perhaps the most spectacular aspect of electric power development. This has already played an important part in the foreign trade of the world and can be measured in export and import returns. A second important result, which might have been regarded as inevitable even if no change had taken place in the economic status of any country, has been the diversification of industrial enterprise. In Great Britain the exporting industries are ceasing to be dominant and are giving way to an enormous number of comparatively small industries which have arisen to supply the requirements of the consumer once met by imports. Electricity has the beneficial economic result of spreading out more completely industrial activity over the area of the country, of loosening and rendering more flexible the entire industrial configuration and of stimulating local activities, in some cases of a purely agricultural type. The mechanization of agriculture, for example, has been dependent on electricity as a primary source of power, although internal combustion engines may have been most important in the actual cultivation processes. Rural electrification is fundamentally bound up with the more effective distribution of economic and industrial activity, and in this sense electricity operates to create a situation different from that which obtains in its own production. It tends to break up the large central manufacturing units into their constituent parts and to encourage the entrance of new enterprises into industry, while it renders unnecessary in many types of industrial enterprise the formation of very large plants.

The development of agricultural electrification and the extension of electricity to rural areas have progressed very far in certain parts of the

United States, notably California and the Pacific states. It has been estimated by the National Electric Light Association, for example, that on December 31, 1930, 644,421 farms, or 10.2 percent of all the farms in the United States, were electrified. The capacity of electric plant used directly in agriculture in the United States is about 2,000,000 h.p. In France, 24,717 communes were electrified at the beginning of 1929, while it is estimated that at the beginning of 1930 this figure had risen to 27,500, or 73 percent of the total number. Much of this work in France has been carried out through direct subvention by the French government; from 1923 to 1930 the government advanced nearly \$40,000,000, in the form of loans with interest not exceeding 3 percent, to cooperative societies created by the farmers and rural interests, agricultural collective groups and trade associations. In Germany out of 1,526,000 farms of more than two hectares, equivalent to 82.5 percent of the agricultural area of Germany, 1,166,000, or 76 percent, were linked up with power supply networks; while it was estimated that for the whole of Germany in 1929 the consumption of electricity for purely agricultural purposes amounted to 629,000,000 units, equivalent to 968,000,000 units generated, or 6.7 percent of all central station output. In Sweden about 45 percent of the cultivated area is provided with electricity, 5 percent of the national output, or 243,000,000 units, being used in 1929 for purely agricultural purposes. The consumption of electricity per acre varies considerably from country to country. It is highest in the United States and lowest in France, Belgium and Holland, with a tendency toward steady increase.

Three main movements can be seen in operation. The industrialization of new countries and the improvement of the manufacturing status of older countries which had been deprived of fuel resources have produced a definite change in the economic balance of power in the world; the more effective territorial distribution of industrial enterprise within the old industrial countries has tended to increase the volume of economic activity, render exports less important and increase the power of resistance of the country to international economic depression; the growth of rural electrification and the diversification of industrial enterprise have made more flexible the economic configuration of a country and accelerated in this way the general economic advance.

It is now generally recognized that the elec-

tricity supply industry has become so important a feature in national and even international economic life that it cannot be left entirely to the free play of economic forces. Through its very nature it has enjoyed in practically every country a monopoly position, and one of the consequences of such a position is the state's intervention in the general policy governing electricity supply. With state recognition of the monopoly position has come a certain measure of state supervision, which is most marked in the allocation of concessions for water power development. Thus even in the United States the Federal Power Commission has a strong legislative position with regard to hydro-electric concessions and in almost every hydro-power country, even in comparatively undeveloped countries like Rumania, a state commission has been created to control water power development. It is difficult therefore to believe that further participation of the state will not become necessary, if only to avoid political complications. There is a marked tendency throughout the world for co-ordination through some form of controlled body created either by the industry itself, as in Belgium and to some extent Great Britain, or by definite state control, as in Germany, China and Russia. The reason for this development is sufficiently clear. The enormous expansion of the superpower zone has served to break down local restrictions and impose a national conception of electricity. We have seen also that through unification of control a considerable measure of simplification and of standardization can be achieved, and such changes have tended to increase the economic strength of the industry.

The final situation, where the entire manufacturing organization of the country will be dependent on electricity, is one which must be considered very carefully in the near future. It would be dangerous for the motive power required for industrial production to be in the hands of a small number of groups which may or may not have a clear understanding of their responsibility. The expansion of main transmission at very high voltages has made such a consideration much more urgent than a few years ago; and the participation of the state in electricity supply, above all in the highly industrialized countries like Germany and Great Britain, has been rendered imperative not through any political theory of public ownership, but through the necessity to safeguard adequately the entire economic structure of the country and in harmony with emerging conceptions of national economic

planning. Proposals in the United States for a giant power system of interconnected and unified superpower zones coincide with proposals for the planned control of electrical development to decentralize industry and to combine industry and agriculture.

ELECTRICAL MANUFACTURING INDUSTRY. This comprises plants manufacturing machinery and apparatus used in the generation, storage, transmission and utilization of electric energy. It is not a sharply defined branch of production. On the financial and marketing side it is sometimes difficult to separate electric manufacturing from industries whose equipment it supplies—the electric light and power and the electric communication industries; many establishments in the latter fields are financed and operated by the firms in the electrical manufacturing line. On the technological side too the manufacture of electrical equipment is sometimes carried on under the same auspices as machine and tool making and production of other mechanical equipment. Thus machine shops using electrical appliances often manufacture the necessary parts; conversely, numerous electrical enterprises manufacture machines and tools in which electrical parts are only accessories. The production programs of the different firms in the electrical manufacturing industry are determined less by technological than by economic and historical considerations, such as the conditions of competition, the financial strength of the enterprise, the ownership and lease of patents, the tradition and past experience of the firm. A single firm may be found to manufacture a considerable variety of products, and the output of one firm may differ greatly from that of another as to type of product. The output of the industry as a whole includes among other things heavy current products such as electric generators and motors, transformers, accumulators and storage batteries, cable and wire transmission equipment and installation material, incandescent lamps, electric cooking and heating apparatus; and light current products such as telegraph and telephone instruments and equipment, wireless telegraph and telephone apparatus, broadcasting equipment and radio receiving sets and electrotherapeutic apparatus.

The early development of the electrical manufacturing industry is closely connected with the progress of the scientific knowledge of electricity. As the invention of the electromagnetic telegraph between 1833 and 1844 was the first practical result of scientific research in the field of electricity, the electrical industry first concerned itself

with the further practical adaptation of electromagnetism in telegraph and telephone communication and the development and improvement of the required control and signal appliances. The necessary low voltage current was obtained chemically. The real development of the industry, based on utilization of high voltage current, followed the discovery of induced current by Faraday in 1831 and the discovery and application of the electro-dynamic principle. The substitution of mechanical for chemical generation of electric energy made it possible to obtain greater quantities of current more cheaply. Further improvement along this line was signalized by the invention of alternating current machines and the replacement of the piston steam engine by the steam or water turbine, developments which made possible an enormous increase in plant capacity and which provided the technological and economic bases for the modern electric power industry. The developments in transmission were equally important. The erection of transforming stations and high tension lines and the elimination of formerly unavoidable leakages of current and other uneconomical conditions made practicable the transmission of current over long distances and thus provided the necessary conditions for extending the use of electric current from a few small areas such as large cities to every part of the country.

The use of electric energy instead of other types of power in the factory and in the home is conditioned not only by the provision of current at sufficiently low rates but equally by the development of machines and appliances adapted to the effective utilization of electricity. This has been accomplished by the ingenuity of many individual inventors and the systematic research work carried on by the electrical manufacturing industry itself. It was thus that the carbon filament lamp, the basic invention of Edison, was developed into the gas filled tungsten lamp and the consumption of energy per unit of candle power greatly reduced. The development of telephony and telegraphy was enormously facilitated through the invention of automatic appliances. The progress in electric traction, both local and long distance, has been particularly striking. Apart from equipment adapted to meet special requirements in generation and transmission for traction purposes the electrical manufacturing industry has developed electric locomotives which equal the steam engines in mechanical power and surpass them in some respects. The most significant technical achievement of the

industry is undoubtedly the perfection of the electric motor, a power machine of the greatest importance, which can be used in small and large manufacturing plants and in agriculture. In many cases the electric motor first made mechanization possible for small scale industry and enabled it to compete with medium sized and even large plants. It was therefore important to produce motors of almost every size, even types with a capacity less than one horse power.

The interdependence found between the developments in generation and in transmission is equally characteristic of the improvements in the electric machine and appliance field. Neither the electric lamp nor the electric motor could be used without important adaptations of switching, installation and measuring apparatus. And on a different plane the supply of electric current to large areas could not be concentrated in single power stations without the development of electrical communications which make possible the necessary coordination and unification of control.

Technical progress in the electrical industry was concomitant with the enormous expansion in other branches of production, of which it was both a cause and an effect. The growth of the international economic system during the nineteenth century, both as to geographic scope and as to the strength of economic ties which underlay it, called for extension and improvement in the electrical communication services. The rapid expansion in commodity production and the invention of new production processes and devices demanded an immense increase in disposable motive power and an increased efficiency in its application, which were furnished by electric energy and the electric motor engine. The development of electrochemistry created a demand for electric energy not only as motive power but also as an essential auxiliary material. The rise in the standard of living and the increased employment of women outside the home were met by the growing use of electric lighting and of electrically driven household equipment.

When about 1840 the production of telegraph apparatus was first undertaken, electrical manufacturing was merely a supplementary branch of the production of precise mechanical instruments. Only after the middle of the century did enterprises appear whose major line of production was telegraph equipment and which for the rest limited themselves almost entirely to the manufacture of other electrical appliances. The

heavy current electrical manufacturing which began with the construction of dynamo machines in the seventies and eighties of the last century had matured by 1890 into an independent industry and has since then forged steadily to a position of considerable importance in the economic structure of the world.

Electrical manufacturing companies originated in the control of inventions and patent rights. The fortunes of the pioneering German firm of Siemens und Halske were closely linked in the beginning with the inventions of one of its founders, Werner Siemens; in 1879 this company demonstrated the first electrical railway, the development of which was of prime importance in the growth of the power industry. Inventions and patent rights also constituted the basis of the important American companies. The Westinghouse Electrical and Manufacturing Company, organized in 1872, drew its strength from control of alternating current patents and other patents which it originated or purchased and improved. A company organized in 1878 to exploit Edison's incandescent lamp patents was the predecessor of the General Electric Company, which also secured control of the Thomson-Houston patents; and the Edisongesellschaft organized in Germany in 1883 provided the foundation for the Allgemeine Elektrizitäts-Gesellschaft. Research laboratories early became a feature of the electrical manufacturing industry and the acquisition and control of patents constituted an important policy which produced considerable litigation until the dominant companies resorted to the exchange of patents and of technical experience.

The original capital for electrical manufacturing was supplied by the mechanical industry, which undertook the production of telegraph apparatus as a supplementary line. The first independent enterprises, such as Siemens und Halske, did their own financing, largely out of profits. But the industry's rapid expansion, its large profits and large capital requirements soon attracted the financiers. The great German banks early took an active part in the development of electrical manufacturing and soon dominated the industry. Much of the \$50,000,000 capital of the General Electric Company, organized in 1892 as a combination of several large companies, represented accumulated profits; but the investment banking house of J. P. Morgan and Company participated in its organization, and their relations since have been of the most intimate character.

The capital requirements of the electrical man-

ufacturing industry are extremely large. Construction of machinery and apparatus for the telephone, the telegraph, power plants and distribution systems requires an immense capital equipment possible only in enterprises with the strongest financial resources. These requirements are further increased by the fact that in order to keep its giant plants busy and to meet the competition of gas and steam the industry has adopted the policy of creating markets for its products and undertaken the financing of power plants, street railways and other enterprises using electrical equipment. An extension of this policy has been the organization and financing of electrical supply and communication enterprises in foreign countries. At first the financing of domestic and foreign subsidiaries was done directly by the manufacturing company but as it assumed larger proportions the task was specialized and taken over by autonomous banks, finance and holding companies, in the control of which the parent manufacturing company participated.

Electrical manufacturing, stimulated by the increasing electrification of other industries and the policy of encouraging the consumption of electric energy, expanded rapidly. The American output of electrical products, for example, increased from \$92,434,000 in 1899 to \$335,170,000 in 1914; in 1927 the output was valued at \$1,798,000,000 and in 1929 at \$2,273,000,000. Allowance must be made of course for the war and post-war decline in the purchasing power of the dollar, which is reflected also in the prices of electrical products. The growth of electrical manufacturing was a basic factor in the prosperity which prevailed in Germany between 1890 and 1902. In 1913 the German industry produced 34 percent of the world output of electrical products compared with 29 percent for the United States. Since the war, however, Germany's proportion of the world output has declined to 25 percent while that of the United States has increased to 50 percent. In the year 1928-29 Germany had an estimated output of nearly \$1,000,000,000; this figure is based on American prices for electrical products, which in 1931 were about 20 percent above the German. Electrical manufacturing in Great Britain developed more slowly than in Germany or the United States, in part because of the slower tempo of technical progress and in part because of the comparative neglect of the capital requirements of home industry by bankers who emphasized the export of capital. The output of the British industry in 1928 was valued, according to an estimate by the British

Electrical and Allied Manufacturers' Association, at approximately \$400,000,000; this figure is based on English prices, which are somewhat higher than American, and includes the value of mechanical parts of some electric machines. The British electrical manufacturing industry is pursuing at present a program of electrification, the success of which will offer a powerful stimulus to a rapid expansion of the industry; this program includes development of superpower generation and transmission, the encouragement of basic industries to electrify equipment, main line electrification as part of a transport reorganization scheme, and the direction of foreign investment to power supply companies in order to facilitate electrical exports. France, which was not an important producer before the war, has since substantially increased its electrical production under pressure of intensified industrialization and a comprehensive program of electrification.

The expansion of the electrical manufacturing industry may be measured also by the increase in the generation capacity of the equipment which it installed. In the United States 29,600,000 kwts. were installed in public utility power plants in 1928; the corresponding figure for 1912 was 7,700,000 kwts. In Germany 4,800,000 kwts. were installed in private industrial power stations and 6,300,000 kwts. in public plants in 1928, while in 1900 only 150,000 kwts. were installed in public plants. The capacity of English public power stations rose from 2,600,000 kwts. in 1920 to 5,900,000 kwts. in 1928.

In all the leading countries electrical manufacturing is concentrated in a few giant enterprises, although side by side with these there are hundreds of small enterprises manufacturing specialized electrical appliances. Generally speaking, three types of enterprises may be distinguished: the largest produce equipment for whole plants; others manufacture a great variety of special apparatus used in one or two distinct fields; while a third group manufactures only a few products, either electrical appliances or simply accessory parts.

Concentration in electrical manufacturing is facilitated by the character of the industry's production, its heavy capital requirements and the control of basic patents. The great companies early adopted the policy of cooperative action in the control of markets and prices. Three companies in the United States and two in Germany are responsible for most of the world output. Concentration has not been so highly developed

in Great Britain and France; but in recent years British electrical manufacturers have been pressing for combination, while amalgamation has been going on in France encouraged by the banks. Industrial concentration is supplemented by financial centralization and control: the various divisions of the electrical industry—manufacturing, power supply, telephone, telegraph, cable and radio companies—are bound together into a community of interest by means of holding and finance companies, interlocking directorates and through the influence of the great banking houses.

In the United States the largest enterprise in the field of light current production is the Western Electric Company and the companies closely allied with it. It is impossible to define exactly the production program of this enterprise, which with the allied Electrical Research Corporation and Bell Telephone Laboratories, Inc., employed some 85,000 persons in 1929; yet it is quite clear that it manufactures substantially everything produced in the field of light current engineering, although it is not limited to that field. The capital of the Western Electric Company was \$150,000,000 in 1929 and its holdings in other companies some \$63,000,000; its turnover exceeded \$410,000,000. Characteristic of corporate relationships in the electrical industry is the connection of the Western Electric Company with companies using the apparatus it manufactures; 98 percent of the capital stock of the Western Electric Company is in the hands of the American Telephone and Telegraph Company, which directly or through the associated Bell Telephone companies operates the largest telephone enterprise in the United States. In addition to being the manufacturing subsidiary of the American Telephone and Telegraph Company the Western Electric Company buys for that company all products not produced by itself and engages in the manufacture of radio and talking picture apparatus.

Another subsidiary of the American Telephone and Telegraph Company is the International Telephone and Telegraph Corporation, operating in the foreign field. This corporation, organized about 1921, operated at first only as a service and construction company for telephone and telegraph enterprises (including wireless) but it later turned to the manufacture of light current products and became the holding company of the Western Electric Company's foreign manufacturing subsidiary, which became the International Western Electric Company and later the

International Standard Electric Company. There is no evidence that a stockholding relationship exists between the latter company and the Western Electric Company; but the control is unified and the exchange of patents and experience probably takes place, such arrangements being common among big enterprises in the electrical industry.

The great American enterprises in the field of heavy current production are the General Electric Company and the Westinghouse Electric and Manufacturing Company, including their subsidiary companies. The General Electric Company, excluding subsidiary companies, had in 1929 a capital of \$42,929,000 special stock and \$180,287,000 common stock, holdings in other companies of \$183,778,000 and net profits of \$67,290,000. One of its subsidiary companies is the International General Electric Company, in which are concentrated the parent company's export business and holdings in foreign enterprises; it had in 1929 a gross income of \$5,200,000 and a net profit, available for the payment of dividends, of \$1,700,000. The General Electric Company's holdings in power and light and other electrical enterprises are largely concentrated in a holding company, the Electric Bond and Share Company, and it also has large investments in the Radio Corporation of America. The Westinghouse Electric and Manufacturing Company, inclusive of three subsidiary companies, had in 1929 a capital of over \$129,000,000 common stock and some \$3,999,000 preferred stock; its turnover was \$216,000,000 and the net profit \$27,000,000. Since 1896, when they agreed on an exchange of patents and division of markets, the General Electric Company and the Westinghouse Electric and Manufacturing Company have worked in close cooperation emphasized by common financial affiliations.

In Germany the largest enterprise in the light current field is Siemens und Halske A.-G. and its subsidiary companies. Its position in Germany is similar to that of the Western Electric Company in America. As the communication services in Germany are in the hands of the state, Siemens und Halske cannot establish relations with enterprises using its products similar to those existing between the Western Electric Company and the American Telephone and Telegraph Company; nevertheless it supplies under contract two thirds of the telephone equipment used in Germany.

The two most important German enterprises in the heavy current field are the Allgemeine

Elektrizitäts A.-G. and the Siemens-Schuckert-Werke A.-G. Both of these enterprises have a large number of manufacturing and financial subsidiaries and control the major share of Germany's electrical manufacturing output. Siemens-Schuckert is a combination of the Elektrizitäts A.-G. vorm. Schuckert & Co. and the heavy current production plants of the Siemens und Halske A.-G. Siemens-Halske owns 51 per cent of the Siemens-Schuckert capital stock; the two enterprises constitute the Siemens Konzern, the largest electrical manufacturing group in Europe. This combination had in 1929 capital stock of \$54,090,000 and assets of \$206,500,000. In the same year the Allgemeine Elektrizitäts A.-G. had capital stock of \$47,640,000, assets of \$138,040,000 and holdings in subsidiary and affiliated companies of \$30,720,000.

In France two groups, both manufacturing similar heavy current products, account for the major share of the total electrical output. The larger group consists of the Société Thomson-Houston, a subsidiary of the American General Electric Company, and the affiliated Société Alsacienne de Constructions Mécaniques; it controls a number of smaller companies, including the Compagnie des Lampes. The other group is composed of Schneider et Cie and the Forges et Ateliers de Constructions Électriques du Jumont. Schneider et Cie, formerly producing only iron, steel and munitions, has since the war become an important producer of heavy current electrical products; its association with other iron and steel firms assures a ready market. The two groups control jointly an important light current enterprise, the Société des Lignes Télégraphiques et Téléphoniques.

Electrical manufacturing in Great Britain is distributed among a larger number of major companies than in other countries: twenty-one firms or groups in 1927 produced approximately 60 per cent of the output, among them the British General Electric Company, Metropolitan-Vickers Electrical Company and British Thomson-Houston Company. Several dominant groups are emerging, however, owing to a recent series of mergers and amalgamations. In 1929 the Metropolitan-Vickers Electrical Company became the Associated Electrical Industries, Ltd., and acquired control of the British Thomson-Houston Company, the Edison Swan Electric Company and a number of smaller enterprises; the three major companies in this group have a combined capital of \$83,426,000.

Among the numerous firms which manufac-

ture all the machines and apparatus used in a special field or specialize in a single type of product some are quite important in spite of the limited character of their output. Such enterprises are the American Electric Storage Batteries Company, the German Osram G.m.b.H. (incandescent lamps) and the Telefunken-Gesellschaft, the Dutch firm of Philips (incandescent lamps and radio accessories), the Swiss Maschinenfabrik Oerlikon and the French Compagnie des Lampes. In England there are a number of important specialized firms producing transformers, turbogenerators, electric motors and other electrical products.

The special field and single line firms differ considerably as to technical equipment and experience, control of patents, types of market served and legal and political conditions affecting production and sales policies. A number of small enterprises are able to compete fairly successfully with the large because of lower overhead costs, including smaller expenditures for research; and competition both as to price and quality is at times very keen. Competition is regulated, however, by conventions and such combinations as the international Glühlampen Kartell. It is also significant that the two largest German groups, the Siemens and the Allgemeine Elektrizitäts-Gesellschaft, control several companies in common, among them the Osram and the Telefunken.

The electrical manufacturing industry employed in 1929 approximately 1,000,000 workers as compared with 450,000 in 1913. In the United States the number of wage earners increased from 42,013 in 1899 to 329,361 in 1929, while in Germany there were about 280,000 wage earners in 1929 and in Great Britain about 123,000 in 1924. The composition of the labor force varies according to the character of the output of the different plants. For example, in the field of light current products, such as telephone apparatus, women constitute an appreciable proportion of the labor force. The majority of the workers in the industry are semiskilled or unskilled, and the steady mechanization of the production process tends to increase the proportion of semiskilled at the expense of both the skilled and the unskilled labor; nevertheless, the proportion of skilled workers is still larger than in most other industries. It is probable that American plants have more technical equipment per worker than is found in other countries; in 1927 horse power per wage earner in American plants was 42 per cent greater than in 1914 and in 1929 the Ameri-

can industry had twice as large an output as the German, while employing only 18 percent more workers. Accident rates in the industry are somewhat higher than the average for manufacturing as a whole.

Wages vary in different countries; they are lowest in France and highest in the United States. In England the average hourly rate of wages has been in recent years slightly below one shilling. In Germany 85 percent of the skilled and 45 percent of the unskilled had in 1925 weekly earnings ranging from 40 to 50 marks; in 1929 the average of yearly earnings of the 137,000 workers employed by the Siemens Konzern was \$630. In the United States average yearly earnings were \$1302 in 1923 and \$1352 in 1929, a trifle higher than the average for manufacturing as a whole and about \$300 below the automobile industry's average.

While industrial integration and financial centralization are highly developed in electrical manufacturing industry, labor organization—with the exception of Germany—is weak, scattered in craft unions or non-existent. Labor is best organized in Germany: the powerful Metal Workers Union includes many electrical workers and many more belong to other unions. Labor organization is weaker in England, where a minority of the workers are organized in a number of unions, among which jurisdictional disputes often occur; there is noticeable, however, a strong trend toward industrial unionism. In the United States unionism is practically non-existent. The Brotherhood of Electrical Workers is almost exclusively limited to the building trades. Since 1901 the General Electric Company has maintained an open shop policy, although during the war there was a sort of collective bargaining in the company's plant at Schenectady, New York, where part of the workers were organized in different unions. Dissatisfied with conditions, the General Electric Company's workers organized in 1918 an Electrical Manufacturing Industry Labor Federation, which was at first partly successful; but strikes and the depression of 1921 almost destroyed unionism. In 1922 the General Electric Company tried to introduce its Industrial Representation Plan, which was voted down by the employees. In 1924 the management, without calling for preliminary approval by workers, established a Works Council which is virtually controlled by the management. Through the council the company has introduced contributory pension, unemployment relief, thrift and loan plans. The unemployment relief plan, adopted

experimentally in 1931, calls for the contribution of 1 percent of wages by the employees, which the company matches, and relief payment of 50 percent of earnings after two weeks of unemployment. The Westinghouse plants have also experimented with employee representation schemes.

The character of product of the electrical manufacturing industry is such that the principal producing countries are forced to export a large part of their output and to strive constantly for an expansion of export outlets. The initial domestic demand for electric equipment and appliances stimulates the rapid development of the electrical manufacturing industry; after the initial demand has been met the need for additional equipment and appliances, whether for the electrification of new industries and localities or for annual additions and replacements, is not sufficient to keep the industry running at full capacity. Electrical exports show therefore a steady increase; in 1929 they amounted to about \$500,000,000, approximately one half consisting of electric machinery, telephone, telegraph and radio apparatus, cables and wires. About three fourths of the total exports are by Germany, the United States and Great Britain. Since the World War, which temporarily destroyed Germany's foreign markets, both the United States and Great Britain have increased their share of total exports. American exports have shown a particularly large increase; while the annual average in the period from 1910 to 1914 was about \$20,900,000, the exports were valued at \$85,358,000 in 1926 and at \$121,356,000 in 1929.

TABLE I
DISTRIBUTION OF ELECTRICAL EXPORTS AMONG
PRINCIPAL EXPORTING COUNTRIES *

EXPORTING COUNTRY	PERCENTAGE OF TOTAL FOR THE FIVE COUNTRIES EXPORTED IN		
	1913	1924	1928
Germany	48.5	26.7	32.6
United States	17.7	30.9	30.8
Great Britain	23.4	30.4	27.4
France	6.7	8.2	4.9
Switzerland	3.7	3.8	4.3

* Approximately 80 percent of the world's electrical exports are represented in the 1928 figures. Certain items, including German electrical products exported as reparation payments in kind, have been eliminated to make the figures comparable.

Source: Adapted from British Electrical and Allied Manufacturers' Association, *The Electrical Industry of Great Britain* (London 1929).

The importance of foreign markets as an outlet for the industry's output varies from country to country and is not correlated with the magnitude of the industry. The United States, pro-

TABLE II

DISTRIBUTION OF ELECTRICAL EXPORTS OF GERMANY, UNITED STATES AND GREAT BRITAIN, 1929

IMPORTING COUNTRY OR REGION	GERMANY		UNITED STATES		GREAT BRITAIN	
	AMOUNT (in \$1000)	PERCENT OF TOTAL	AMOUNT (in \$1000)	PERCENT OF TOTAL	AMOUNT (in \$1000)	PERCENT OF TOTAL
Europe	106,281	80.4	21,412	17.6	18,446	21.0
Great Britain	9,274	7.0	7,431	6.1	—	—
France	9,384	7.1	2,059	1.7	1,686	1.9
Italy	8,237	6.2	1,970	1.6	2,634	3.0
Germany	—	—	1,307	1.1	500	0.6
U. S. S. R.	5,826	4.4	2,583	2.1	1,603	1.8
Spain	3,336	2.5	1,999	1.7	2,984	3.4
All other	70,224	53.2	4,063	3.3	9,039	10.3
Canada	—	—	38,645	31.9	2,663	3.0
United States	2,456	1.9	—	—	1,414	1.6
Latin America	12,154	9.2	34,593	28.5	9,909	11.3
Asia	9,063	6.8	15,283	12.6	24,620	28.0
Africa	1,358	1.0	2,535	2.1	9,477	10.8
Oceania	852	0.7	8,888	7.3	21,384	24.3
Total *	132,164	100.0	121,356	100.0	87,913	100.0

* The German and British totals do not include undistributed amounts of \$5,712,000 and \$7,231,000 respectively. The German total includes \$7,854,000 of reparation payments in kind.

Source: Compiled from the *Statistisches Jahrbuch für das deutsche Reich* for 1929, published by the Statistisches Reichsamt; the first volume of *Commerce Yearbook* for 1929, published by the United States Department of Commerce; and the *Annual Statement of the Foreign Trade of the United Kingdom, 1929*, vol. iii, published by the British Statistical Office of the Customs and Excise Department.

ducing about one half of the world's electrical goods, exports only 5 percent of its output, while Great Britain exports 25 percent of its output and Germany 14 percent. Nearly one third of American exports in 1929 went to Canada and almost as large a share to Latin America, which is becoming an increasingly important market for the products of the American electric industry. Germany depends to a very large extent upon European markets, while over 60 percent of British exports are absorbed by the British dominions and colonies, practically all of whose imports, except in the case of Canada, originate in Great Britain. Outside of Europe, Latin America offers the most important export market to the electrical manufacturing industry of the world.

After the war the raising of customs tariffs throughout the world put obstacles in the way of normal development of international trade in electrical products. Many countries, such as Japan, Italy, Spain and Canada, have definitely encouraged the development of electrical manufacturing within their borders. Similarly, the development of a self-sufficient electrical industry is basic to Soviet Russia's industrialization plans. Yet customs duties, however high, are not particularly effective in stimulating domestic manufacture in the electrical field, since this industry requires heavy capital outlays. Moreover, the leading export companies take steps

to insure an adequate amount of foreign business by securing control of the existing electrical supply and of communication enterprises abroad and by organizing and financing new enterprises in this field. Such control is obtained either by means of their own subsidiary finance and holding companies or by affiliation with such companies operating in the international field of electrical supply and communication. Thus the International Telephone and Telegraph Corporation controls a network of electrical communications systems in Latin America and other parts of the world, assuring orders to its subsidiary, the International Standard Electric Company, and to its affiliate, the Western Electric Company. The American and Foreign Power Company, an affiliate of the General Electric Company's affiliate, the Electric Bond and Share Company, controls many foreign electric power enterprises. German, French and Swiss companies are similarly interested in foreign electrical supply and communications. In addition, the dominant companies all maintain manufacturing enterprises in the more important markets; an instance of this is the Canadian General Electric Company, a subsidiary of the General Electric Company of the United States.

Combination and cooperation in the control of markets and prices prevail in the international field just as in the domestic, the leading firms being bound together by patent agreements,

interlocking financial interests and division of markets. The Westinghouse and General Electric companies maintain cooperative relations with the International Telephone and Telegraph Corporation, whose subsidiary, the International Standard Electric Corporation, joined in 1929 with the Allgemeine Elektrizitäts-Gesellschaft to establish the Standard Elektrizitätsgesellschaft for the control of important light current plants in Germany. The Westinghouse and Siemens companies have strengthened their pre-war relations, which involve the exchange of patents and experience and the division of markets. In 1930 the General Electric Company purchased \$10,000,000 of Siemens und Halske debentures; in the previous year the American company secured a 16 percent interest in Osram, the largest European manufacturer of incandescent lamps, controlled jointly by Siemens and the Allgemeine Elektrizitäts-Gesellschaft. In 1931 the International Telephone and Telegraph Corporation established cooperative relations by an exchange of stock and interlocking directorates with its most important competitor in the telephone field, the L. M. Ericsson Telephone Company, a large Swedish concern which operates eight telephone companies in Argentina, Mexico, Italy, Turkey and Poland, and maintains in continental Europe and in England sixteen manufacturing companies producing telephone, cable and other communications equipment. The relations between the General Electric Company and the Allgemeine Elektrizitäts-Gesellschaft are very intimate; they have long had agreements for the exchange of patents and experience and the division of markets, and the General Electric Company has a considerable stock interest and two directors in the German company. In France the General Electric Company controls the important Société Thomson-Houston, and in 1930 it concluded an agreement for exchange of patents and manufacturing experience with the British Associated Electrical Industries, Ltd. There are also patent agreements in wireless telegraphy between French and German companies and the Radio Corporation of America, in which the General Electric and the Westinghouse companies have substantial interests. A minor group is composed of Brown, Boveri and Company of Switzerland, with subsidiaries and affiliated companies in thirteen European countries, Argentina and the United States. The British electrical manufacturing enterprises constitute an independent group offering competition in the world markets

and resisting penetration by American capital.

In the foreign as well as the domestic field the future of the electric manufacturing industry is dependent upon a steady opening up of new markets and expansion of old. New generating and distributive plants must be built in hitherto undeveloped localities, railroads electrified, telephone and telegraph equipment made increasingly automatic, manufacturing and household equipment of various types better adapted to the use of electric energy, radio broadcasting and talking pictures popularized in new markets, if the industry is to utilize its existing capacity and grow at a normal rate. In a very real sense therefore the future fortunes of the electrical manufacturing industry will be determined by the progress of scientific research and of invention directed and financed by the industry as well as by the rate of general industrial and economic development.

ELGIN, EIGHTH EARL OF, JAMES BRUCE (1811–63), British imperial statesman. After a successful governorship in Jamaica from 1842 to 1846 Elgin became governor general of Canada in 1847. Earl Grey, the new colonial secretary, set him the task of fully establishing Lord Durham's conception of responsible government. Elgin's success placed Canada securely in the path of self-government. Through a severe financial depression, in the face of bitter accusations that he was sacrificing British interests and confronted by outbursts of physical violence he patiently maintained the new role of the impartial governor, willing to establish any party in power if it could control a parliamentary majority. He made it clear that the ultimate decisions rested with his ministers but he guided them constantly by his advice and educated them in the practise of British cabinet government. He also aided Canada economically. After Canada's preferential treatment in Great Britain had been destroyed by the British adoption of free trade, he succeeded in 1854 in establishing a reciprocity treaty with the United States which restored prosperity. He returned to England at the close of that year. Sent to China on a special mission in 1857, Elgin secured by a balanced admixture of diplomacy and force the Treaty of Tientsin of 1858, which provided for commercial privileges for British merchants, protection for missionaries and a resident British minister at Peking. He also secured concessions from Japan by the Treaty of Yeddo. A year before his death he was made viceroy of India. Cool, practical, objective, with balanced sympathies, Elgin possessed an ardent enthusiasm for the strength and solidarity of the British Empire and the welfare of its people.

ELIOT, CHARLES WILLIAM (1834–1926), American educator. Eliot, who was born in Boston and educated at the Boston Latin School and Harvard College, began his career as a teacher of mathematics and chemistry. In 1869 he was elected president of Harvard, and in this position, which he held for forty years, he not only transformed the university but exercised a vast influence over the whole field of American education. The most conspicuous change which he introduced into Harvard College was the

elective system, an application of his fundamental principle of the importance of freedom in the development of the individual and society.

The professional schools of Harvard were in a lamentable condition in 1869 and Eliot proceeded at once to regenerate them. The Medical School was put on a new basis by raising requirements for admission, lengthening the period of training, making the courses sequential, introducing written examinations and providing clinical and laboratory opportunities. The Law School was revolutionized by the appointment of C. C. Langdell as dean and the introduction of the case system of studying law. The standards of the Divinity School were similarly raised, and a Graduate School of Arts and Sciences and later one of Business Administration were founded. He changed Harvard from a limited provincial college with two or three weak professional schools into a great modern university, and his policies were widely imitated. The question of standards for admission led him to deal with the curriculum of the secondary schools, and he did much to raise their standards.

He took a deep interest in public affairs and during the latter part of his career, especially after his resignation as president, exercised a wide influence on public opinion. He was an enthusiast for civil service reform, an opponent of protection, a supporter of the foreign policies of Woodrow Wilson, a believer in the League of Nations. When he was seventy-seven he made a tour round the world on behalf of the Carnegie Endowment for International Peace. In questions of capital and labor he believed in collective bargaining but opposed the closed shop, and was much interested in schemes of profit sharing. In religion he was a liberal Unitarian and in his social relations thoroughly democratic.

W. A. NEILSON

Consult: James, Henry, Charles W. Eliot, 2 vols. (Boston 1930), the official biography, containing bibliography of Eliot's writings. Representative selections from his works are *A Late Harvest*, ed. by M. A. DeW. Howe (Boston 1924), and *Charles W. Eliot, The Man and His Beliefs*, ed. by W. A. Neilson, 2 vols. (New York 1926).

ELIOT, GEORGE (Mary Ann Evans) (1819–80), English novelist. She was from early youth an insatiable reader, supplementing her ordinary schooling by private lessons and hard study at home. Her translation (3 vols., London 1846) of David Strauss' *Das Leben Jesu* was her first literary work and the first expression of her lifelong preoccupation with religion and moral

philosophy. Her unconventional union in 1854 with George Henry Lewes, who because of the English divorce law of the time was unable to free himself legally from his unsuccessful marriage, was the chief event of her later life and an episode of the century. To one of her conscientious nature the strain of her position was extremely severe, but in Lewes she found the compensation of an acute intelligence and a generous encouragement which aided her career at every point.

George Eliot's creative writing was not begun until she was thirty-seven, two years after her alliance with Lewes. Her success as a novelist was instantaneous and second only to that of Dickens in the England and America of that day. Her books interpreted with delicate sensitivity the lives and emotions of a representative section of rural England, familiar to her from her childhood. Through them all runs the undercurrent of her profound belief in man's responsibility to a moral law higher than any represented by orthodox dogmatism. Her father, although a churchman, had sent her to non-conformist schools, and the trends there initiated had later been confirmed by the influence of Charles Bray, a freethinking writer and neighbor, and by her wide reading and friendships, through which she kept in close touch with the most advanced thought of the time.

Living her sequestered life she was aware of the rising woman movement without being fully in touch with it. Her contribution to the movement was her own life rather than anything she thought or said about it. She was baffled by the problem of combining domestic life with creative activities, but although in theory she deemed the problem insoluble she solved it in practise, for she was both a housewife and a professional worker from her sixteenth year. Her vindication of an unconventional union was a similar practical triumph of personality. That she was unaware to the end of her life of what she had accomplished does not detract from the final estimate of it.

H., *The Early Life of George Eliot*, University of Manchester, English series, no. iv (Manchester 1913); Stephen, Leslie, *George Eliot* (London 1902); Haldane, E. S., *George Eliot and Her Times* (London 1927); May, J. L., *George Eliot* (London 1930); Pond, E. J., *Les idées morales et religieuses de George Eliot* (Paris 1927).

ELIOT, SIR JOHN (1592-1632), English parliamentarian and political thinker. Eliot was a member of the House of Commons in the Parliaments of 1614, 1624, 1626 and 1628-29. At first loyal to the government, he quarreled with the favorite Buckingham's incompetent management of affairs in 1626 and to assert Parliament's right to determine ministerial responsibility demanded his impeachment. He was active in promoting the Petition of Right in 1628. After Buckingham's death Eliot gave the powerful support of his eloquence to the Commons' claim to grant or withhold customs revenue and to criticize innovations in religion. He was the hero of the tumultuous scene of the adjournment in March, 1629, when the speaker was held down while Eliot's three resolutions on religion and taxation were put to the House. Two days later he was imprisoned for the fourth time; and since he refused on the ground of a member's privilege to admit the right of the courts to question his conduct in Parliament he was sent back to the Tower, where three years later he died.

Eliot's views as a political theorist are not always free from obscurity. He is a much fiercer advocate of popular liberties, which he associates closely with parliamentary privileges, in the spoken than in the written word. If the thoughts committed to paper during his last imprisonment represent his mature opinions, it is doubtful whether or not he realized the revolutionary path along which the example of his public acts and martyr's death would carry the opposition. 'The state exists, he writes, for the benefit of the people. Its prince is bound in conscience by virtue of his office to promote the public utility and good, to dispense justice impartially, to provide well considered laws. Legislation, which must be reduced to the minimum in order to retain the utmost liberty for the subject, is enacted by the ruler on the advice of his counselors, viz. Parliament. Eliot does not concern himself with the principle of popular representation. His ruler, a powerful magistrate laboriously defined by reference to the writers of antiquity and the sixteenth cen-

tury controversialists, retains full sovereignty. 'There is no contract between him and his people which can be conceived of as nullified should he break his oath. The powers of the monarch are in fact sanctioned by the laws of God and of nature.

ELIZABETH (1533-1603), queen of England. A writer of the generation after Queen Elizabeth said of her, "For her own mind, what that really was I must leave, as a thing doubly inscrutable, both as she was a woman and a queen." Yet the reign of Elizabeth is to be explained only by a comprehension of this double personality and of its reaction to the problems presented to her. As a woman Elizabeth possessed physical vigor, mental alertness and courage and at the same time personal vanity, niggardliness and, most marked of all, a difficulty in reaching decisions. These inherited characteristics were but little changed by her childhood surroundings, her early training in caution and fifty years of court life. Her emotional experience was narrow, since for most of her life she had neither lover, husband, father, mother, child, brother nor sister. Most if not all of her so-called love episodes were only distant approaches or political negotiations. Her mental powers were mediocre notwithstanding her excellent education and a certain quickness of apprehension, and she was without originality or ambition.

As a queen she inherited the almost despotic position of the Tudor monarchs and shared their devotion to their royal duties as well as their attachment to their subjects. In the course of her long reign with its crowding problems she became to a large extent politically minded. In governmental affairs her attitude was almost entirely negative. She made no effort to initiate policy or volunteer action. She always awaited the impact of events or the advice of her ministers and even then was little impressed by the former or influenced by the latter.

The larger questions of Elizabeth's reign were in internal affairs the coinage and financial

policy, enclosures, the national food supply, pauperism, religion, trade and the fortunes of individual persons; in external affairs her marriage, her rivalry with Mary Queen of Scots, colonization, piracy and relations with Spain, France, the Netherlands, Scotland and Ireland and the more distant countries with which England was brought into contact by the activities of its merchants. With most of these questions the queen had little to do except to approve or sometimes to disarrange the efforts of her ministers; but with the last group, foreign relations proper, she was necessarily closely concerned. Her policy in these matters was mainly one of procrastination, partly perhaps from deliberate choice but mainly from congenital indecision—a characteristic which probably explains also her avoidance of marriage. She had, however, a real desire to avoid war and to spare the expenditure of money for public purposes. She extended some help to the Protestant party in France and the Netherlands and gave continuous but grossly inadequate support to her forces engaged in the reconquest of Ireland.

In the last eighteen years of her reign she was drawn into a desultory war with Spain, of which the defeat of the Invincible Armada was a striking but by no means a typical episode. During this war and indeed during her whole reign her policy of postponement was often justified by results. Under the circumstances of the time the problems often settled themselves by delay. The reign of Elizabeth was a great period in English history. This was due in the main to the vigor and gifts of the people and to the important world events in progress; in a minor degree to the fulfilment by the queen of the high demands of her position.

ELLESMERE, BARON, THOMAS EGERTON (1540-1617), English chancellor. Ellesmere held the Great Seal either as lord keeper or as lord chancellor for twenty-one years from 1596 to 1617. He thus served both Elizabeth and James

Eliot—Ellsworth

1, enjoying the confidence and favor of both. Ellesmere, like Bacon, held an exalted idea of the prerogative, and took a leading part in organizing the staff and procedure of the Court of Star Chamber and in constituting it a regular and settled tribunal. But Ellesmere's chancellorship is chiefly notable by reason of the settlement of the long standing dispute between the Court of Chancery and the courts of common law which had its beginnings at the close of the fifteenth century.

Almost from the earliest period the common law courts had prevented encroachments upon their jurisdiction by restraining suitors in other courts by the use of writs of prohibition. With the growth of the equitable jurisdiction of the Chancery it became clear that the chancellor would be unable to modify the law on equitable principles unless he could exercise a similar power by means of the injunction, which therefore he used increasingly. With the ever expanding jurisdiction of the Chancery in the sixteenth century the resulting conflict between the two sets of courts became more and more acute. It had moreover a marked political character and gradually merged in the constitutional struggle between crown and Parliament. The common law courts, which from the beginning had been in close alliance with Parliament, had become more and more independent of the crown, while the Chancery as an offshoot from the King's Council continued to be identified in large measure with the exercise of royal prerogative. The two protagonists who stood face to face in this arena of jurisdictional combat were Coke, the representative of common law, and Ellesmere, the representative of equity. The whole matter, which, in Lord Campbell's words, had "produced an explosion which shook Westminster Hall to its centre," was referred to King James himself, who settled the long controversy in favor of the Chancery. Although it lingered on, largely as an academic question, through the seventeenth century, all attempts to reverse the decision by the statute of a Parliament victorious over the king proved unavailing.

There is no doubt that James, inspired as he was by ideas of absolutism, found it both easy and pleasant to decide in favor of the Chancery and thus to maintain his theory that he was himself the supreme arbiter in disputes between his judges. At the same time it is evident from the arguments of Lord Ellesmere in *The Earl of Oxford's Case* [1, Reports in Chancery (1615)] with respect to the jurisdiction of the Chancery,

and not less from the case which he presented to the king in favor of the Chancery's contention, that the lord chancellor although he held high prerogative views based his position, in opposition to Coke's claim that the common law judges were "the superintendents of the realm," far more upon the established practise of the Chancery and the nature of substantive and procedural equity than upon absolutist ideas of royal power.

Chiefly because of his vindication of the powers of Chancery Lord Ellesmere's chancellorship is a landmark in the history of equity. In essence the king's decision established equity as an independent system free from the control of the common law courts. The equity administered by Lord Ellesmere was practically of the same nature as the equity described in *Doctor and Student*; and yet it can be seen from *The Earl of Oxford's Case* that the influence of the lawyer chancellors, as opposed to the earlier chancellors who were ecclesiastics and canonists, had already made itself felt. Although the process of reducing the rules and principles of equity to a system had not proceeded far at the time of Ellesmere's relinquishment of the Great Seal, his victory was consolidated by Bacon, his immediate successor.

ELLSWORTH, OLIVER (1745-1807), American judge and statesman. Ellsworth's early years were spent in the practise of law in his native state of Connecticut. After a short local political career, from 1778 to 1783 he was a member of the Continental Congress. With an intrinsic states' rights point of view, he had, however, no fear of properly circumscribed national authority. He was a member of the Committee on Appeals of the Continental Congress, the first national judicial body. It had appellate jurisdiction in prize cases and during Ellsworth's term of service dramatically demonstrated its inability to enforce its decrees against state opposition. This need for effective jurisdiction in admiralty and prize causes was a large factor leading to the demand for national judicial tribunals with independent powers. After a short but important service as state judge in

Encyclopaedia of the Social Sciences

the formative period of American common law Ellsworth represented Connecticut at the federal constitutional convention of 1787. As a member of the significant Committee of Detail he had a large though obscure part in the drafting of the constitution. In the first Congress he became chairman of the Senate Judiciary Committee that reported the bill organizing the federal judiciary. In 1796 he became chief justice of the United States, serving nearly four years, until ill health forced his retirement. While chief justice he was sent abroad and negotiated the commercial convention of 1800 with France.

Ellsworth's impress on American life is due primarily to his work as author and sponsor of the Judiciary Act of 1789. The chief contest upon that act revolved about the establishment of inferior federal courts; the alternative was to leave the federal jurisdiction to the state courts in first instance. By pressing for the creation of separate federal courts with a responsible grant of jurisdiction, including a right to remove federal cases from the state courts, and by providing for review by the Supreme Court over state courts in constitutional cases Ellsworth laid down the main structural lines for the creation of the existing federal judicial system. Important modifications in other provisions of the act have been relatively few and have fulfilled rather than reversed the course of development there begun. In its basic outline and indeed in much of its careful phraseology the act of 1789 still governs the area of the exercise of federal judicial power.

G., *The Life of Oliver Ellsworth* (New York 1905); Warren, C., "New Light on the History of the Federal Judiciary Act of 1789" in *Harvard Law Review*, vol. xxxvii (1923-24) 49-132; *The Journal of William Maclay*, ed. by E. S. Maclay (New York 1890); Frankfurter, F., and Landis, J. M., *The Business of the Supreme Court* (New York 1927).

ELM, ADOLF VON (1857-1916), German labor leader. Von Elm was a cigar sorter by occupation and began his trade union career as business manager of the Hamburg cigar sorters' union in 1883 upon his return from a four-year stay in the United States, during which he had become convinced of the importance to the working class of "cooperative self-help." Thereafter, as the only person who held important posts in all three branches of the movement, the trade union, the cooperative and the political, von Elm was a significant influence. In 1891 he

became business manager of the Hamburg tobacco workers' producers' cooperative, which was functioning successfully when in 1909 it was absorbed by the consumers' wholesale society of Hamburg. Von Elm was one of the first working class leaders to recognize the potentialities of consumers' cooperation as a weapon in the hands of the working class. He was one of the founders in 1899 of the Hamburg consumers' society, *Produktion*, which under his leadership became the model for consumers' societies in Germany; he also served as chairman of the committee for the central union of consumers' societies and in 1912 instituted and directed a cooperative insurance society as a joint enterprise of the trade union and cooperative movements. He was a member of the *Generalkommission*, the highest tribunal of the German trade unions, substituting at times for its head, *Legien*. Von Elm himself served as Social Democratic member of the Reichstag from 1894 until 1906. As a revisionist he stressed the participation of the working class in all measures for the reconstruction of the social order. In his various official capacities and as a contributor to socialist and other working class periodicals he stressed the necessity of a militant labor policy. As early as 1892 he insisted on the importance of strong trade union strike and unemployment benefit funds and of cooperation both for consumption and for production as the necessary bases for that economic strengthening of organized labor upon which its political and industrial power must depend.

ELPHINSTONE, MOUNTSTUART (1779-1859), Anglo-Indian administrator and historian. Elphinstone went to Bengal in 1796 in the East India Company's service. He was soon employed in diplomatic work and served as resident at Poona at a most critical period in British relations with the peshwa, or head of the Maratha confederacy. After 1818 Elphinstone was placed in charge of the political and administrative organization of the annexed territory. He showed himself wisely eager to maintain the traditional mode of administration as far as that was compatible with western ideals, preserving the dignity of local chiefs and encouraging the indigenous system of education. From 1819 to 1827 he was governor of Bombay. The outstanding features of his government were the enact-

ment of a code of law and the promotion of popular education. Through his efforts a systematic investigation of the native customs and usages was begun and all the Bombay regulations were revised and organized into a code. Its section on criminal law prevailed until the introduction of the criminal code. Elphinstone constantly urged upon the government the necessity of educating the natives, so that they should become qualified to hold increasingly responsible positions in the administrative system. Without such an arrangement, he felt, the native population would remain hopelessly degraded. He believed, moreover, that whatever policy England pursued she would probably lose India ultimately. He respected Hindu learning and insisted that it should not be neglected under British rule.

In 1815 he published *An Account of the Kingdom of Caubul* (rev. ed., 2 vols., London 1839) based on the knowledge he had gathered in the course of a mission to Peshawar in 1809. In 1841 his two-volume *History of India* appeared (5th ed., 2 vols., London 1866). It was memorable as the first serious attempt to reconstruct the history of Hindu and Moslem India as a whole. The Hindu section has long been superseded by the discoveries of archaeologists, but the Moslem section is still worth reading for the acute judgment of individuals.

EMANCIPATION is a concept embracing the means by which submerged groups or individuals become divested of some of their disabilities. While the phenomena of emancipation are as old as human enslavement and as varied as the political techniques for exploiting the labor of others, it has been historically notable with respect to slavery and serfdom.

The most widespread forms of emancipation have been individual. In classic Greece and Rome manumission was a normal episode in the institution of slavery. It took place publicly according to prescribed forms as the voluntary act of the owner. Aristotle advised it as a prospective reward for diligence. The commercial pursuits entrusted to slaves in the last century of the Roman Republic provided means by which large numbers compensated for their manumission. Others were set free from vanity, to insure a

following of clients when a senator walked abroad or a splendid funeral at his death. Augustus sought to check an epidemic of emancipation that was turning Rome into a city of freedmen. But as slavery became steadily less advantageous economically, ethical teachers, stoic and Christian, praised manumission as a creditable gesture, while protective legislation facilitated the assimilation of agricultural slaves to the status of coloni. Manumission did not confer citizenship in the ancient world. The freedman became a kind of client with hereditary personal and economic ties to a patron. Freedmen, however, rose to great power in administrative capacities under the Roman Empire. Their status was improved both through social pressure and by imperial decree, and the last of their disabilities were removed by Justinian.

Individual manumission similarly accompanied the plantation slavery of modern times in the Americas. In the Spanish colonies before the nineteenth century it was inculcated as a pious duty; a "protector" furnished facilities for redemption at a fair price, and legal presumptions ran in favor of freedom for claimants who could get the magistrate's ear. In the French, Portuguese, English and Dutch colonies the facilities for manumission were fewer; the more capitalistic the colony, the less the chance of redemption. But manumission by favor or redemption has been everywhere a constant incident of slavery and has been attended by a relatively rapid psychological and economic adjustment of the freedmen.

The emancipation of mediaeval serfs took place also to a great extent through innumerable acts of individual manumission extending over centuries, which commenced almost as early as the recognition of villeinage as a servile status. Collective emancipation conferred at one time upon the servile inhabitants of an entire village or town became notable in twelfth and thirteenth century France and Belgium. In some cases a charter of liberties was wrested from a reluctant lord by an insurrectionary commune. More frequently the grant was secured as the result of a bargain involving stipulated payments, sometimes encouraged by a royal or ecclesiastical overlord. Whether it came as a collective or individual event mediaeval emancipation was partly a recognition of the increased social and economic effectiveness of the peasants, of which population mobility was a striking symptom. And it was partly an adaptation to the rising standards of living of the barons.

There was, however, great regional diversity in the circumstances of the personal emancipation of the serf. In France personal enfranchisement preceded by centuries the complete abrogation of servile tenures. The disabilities removed were especially the lord's right of arbitrary exaction and his control of marriage and inheritance. In England, on the other hand, commutation of services and tenures largely preceded manumission; servitude in many instances simply fell into abeyance or was lost in migrations, while the common law made a presumption of freedom. In the Scottish lowlands servile status was canceled without the villein procuring tenure. In the northwest part of Europe he became a peasant proprietor; in the southern part *métayage* was the rule. In all regions a minority of the emancipated serfs were able to exploit their freedom to considerable economic advantage, and their activity was an essential factor in the onset of modern economic life. The material benefits to the larger number were less decisive.

Emancipation since the temporary abolition of French colonial slavery in 1794 has been characteristically a collective act, applied simultaneously to large administrative units by a public authority frequently exterior to the social situation involved. The emancipation of the southern Negro is comparable to abolition in the European colonies in that it was sudden, largely unprepared and involuntary. The nineteenth century elimination of servile tenures in central and eastern Europe is analogous. The explanation of this new aspect of emancipation movements is the rise of a public opinion increasingly hostile to legal servitude. This opinion, which modern governments have sought by emancipation decrees to enlist on their behalf in divers political emergencies, such as war and revolution, is entirely modern.

The decline of ancient slavery and mediaeval serfdom concerned only those directly involved. It was not a matter for general public opinion. The stoic and early Christian teachers, who advocated ideas of liberty and humanity, did not inculcate manumission as a duty, for the slave was free in his soul or in the city of God, especially if he did not repine. The eighteenth century first brought currents of opinion widely hostile to servitude. Reason portrayed it as a denial of natural liberty. Sensibility grieved at the wrongs of the oppressed. Economists argued the superior productivity of free labor. Adherents of natural religion joined the Quakers in judging slavery in the light of brotherly love.

Utility drew many tendencies into a rational synthesis, crowning benevolence as chief of the virtues and the good of the greatest number as the goal of legislative effort.

The rising bourgeois classes found the implications of these ideas more congenial as applied to the remnants of serfdom than to colonial slavery, which had brought much mobile wealth. But the opportunities for exploiting free labor by means of the machine gradually rendered them bitter opponents of what they came to view as a rival economic system. Abolition seemed a specially grateful means for demonstrating their political power. Thus emancipation of the slaves came to be linked up with the bourgeois cause of civil and political liberties, and the rise of political democracy meant increasingly vigorous action against slavery.

This mingling of essentially different social processes worked some confusion of attitude. On the one hand, proponents of suffrage extension—and even of national or colonial independence—sought to effect a beneficial transfer of attitudes hostile to slavery by terming their object an “emancipation.” At the same time there was a disposition to view the complex problem of social elevation in terms of a mere grant of civil and political rights. This view was entirely congruent with nineteenth century ideas as to the restricted functions of government and to the political aptitude of individuals which was postulated by democratic theory. It proved to be not wholly without justification. For in countries like Cuba, Porto Rico and Brazil, where freedmen were already numerous as the result of redemption and where race friction was slight, the social shock of collective emancipation was minimized. The freedmen were absorbed without serious social or economic disability into the social structure and demonstrated as much political aptitude as other underprivileged classes.

Precisely because of the close identification of the clamor for emancipation with the attitudes of the enterprising classes the psychical and material interests of the submerged were not always clearly envisaged. In central and eastern Europe the emancipation of serfs frequently reflected a desire to gratify the bourgeois spirit, foreign and domestic, without disturbing autocracy. The serf was deprived of much of his holding and set up as individual or collective proprietor of the rest, burdened with debt and unfitted to assume the risks of enterprise. A minority of the peasants were adapted readily to

techniques of petty capitalism. Others fell victims to the money lender. Large estates, new landlord classes and a landless proletariat seeking wages in country and town were consequences of the emancipation which have been assailed in post-war reconstruction.

The experience of the United States with the abolition of Negro slavery was complicated by the attempt to treat the South as conquered territory after the Civil War and to reorganize its political life in the hands of freedmen under the tutelage of adventurers agreeable to a northern clique. Effective political disfranchisement of the Negro followed the collapse of these endeavors, which accomplished chiefly the establishment of the principle of public support for Negro education. With the rise to power of "poor white" demagoguery in alliance with mercantile capitalism, exploiting race antagonism, the Negro was exposed to social and economic handicaps which materially limited the benefits of civil emancipation. Under such circumstances the survival of master-servant relations in many parts of the South served to modify more humanely the effects of an emancipation which was unaccompanied by economic safeguards or preparatory training.

The spirit of emancipation has more recently followed the shifting emphasis of democratic aspiration from political to social and economic objectives. It strikes fresh alliances, here with the ideal of a population buttressed economically by the universal possession of private property, there with movements toward collectivist ideals; now with agrarian programs of land distribution, again with the strivings of industrial proletariats for some measure of control over the conditions of their employment. In inheriting sentiments formed with reference to slavery and serfdom these varied movements of social emancipation recognize that servitude is not a matter of legal disabilities alone. The master-servant relationship is deeply embedded in social habit and is supported by at least some material interest. Attitudes of dominance and subordination answer to basic human urges. Most people learn social and economic responsibility with difficulty, even when it is expected of them. Contemporary efforts to work social redemption of submerged groups wisely emphasize educational techniques and do not neglect the problems of individual adjustment. Legislative measures designed to further social emancipation can succeed only if they effectively encourage or are preceded by readjustments in attitudes and rela-

tionships which broaden the chances for vertical social mobility.

EMBARGO, a Spanish word, was originally applied to the prohibition of the departure of ships from the ports of a country; it is used in that sense in the American Embargo Act of December 22, 1807. More recently, however, the term has come to be used rather loosely for various prohibitions on otherwise legal trade and shipping. During the World War its meaning and scope were extended so that it approximated blockade. A distinction may be made between civil and international embargoes, the former applying only to the ships of the country levying the embargo, the latter to those of other countries as well. But civil embargoes may have international consequences, as in the case of the American embargoes, while embargoes on foreign ships may fall within the police power of the levying state, as in the case of the *arrêt de prince*.

International embargoes in the narrow sense have tended to decline considerably in impor-

tance. The *arrêt de prince*, intended to prevent the spread of information about events in the country levying the embargo, has become obsolete with the development of new means of communication. Largely for the same reason the old practise of embargoing the ships of another country in reprisal and as a means of obtaining redress for some injury committed by that country has largely been abandoned. Ships so seized were released if indemnification was forthcoming; if war followed, they were confiscated as prizes. The related practise of embargoing foreign ships in anticipation of the outbreak of war has been condemned by the Second Hague Conference. Many treaties have been signed which assure alien property a certain period of time in which to leave after the outbreak of war. The right of angary, however, or the right to embargo neutral ships in time of war and compel them to transport arms and munitions, was strongly reasserted during the World War. The decline in the use of these types of embargo is probably largely responsible for the application of the term in international relations to broader types of trade restrictions. The economic sanctions provided in article 16 of the Covenant of the League of Nations may be taken as typical of the broader meaning of embargo in international relations. The article prohibits all intercourse between League members and the covenant breaking state and provides for an attempt to isolate that state completely from all other states.

A civil embargo may be levied for internal reasons alone. The king of England could levy an embargo for a period of three weeks where the good of the public justified such action. In 1766 the departure of ships bearing corn was prohibited; compensation was subsequently accorded the owners of the ships. A similar measure was taken by England in 1926, when ships bearing coal were embargoed on the outbreak of the coal stoppage in May, 1926. During the World War many neutrals forbade the export of certain commodities in order to prevent the depletion of their supply; similar action by belligerents was impelled partly by this reason, partly by a desire to prevent the commodities from falling into the hands of the enemy. In order to prevent this export was forbidden not only to enemy countries but to neutral countries whence they might be reshipped to enemy countries.

Civil embargoes may also be governed by other reasons of international policy. The embargo may be used for defensive purposes, to avoid the

complications arising for a neutral country from attempts by its nationals to carry on trade in war time. The embargo levied by the United States in 1807 was partly intended to prevent the capture of American ships by the British and the French. Some of the neutrals in the World War made similar attempts on a much smaller scale. But the American embargo also represented the only type of offensive policy which appealed to the peace loving Jefferson and was possible for a nation weak in naval equipment. Coupled with the view of Jefferson and the agricultural sections of the country that commerce was unnecessary and undesirable was the hope that suspension of trade might be so keenly felt by the belligerents that they would modify their policy toward neutral vessels. The embargo on grain had been used against Spain by France in the sixteenth century to bolster its weak army; and the threat of an embargo on the export of wheat through the Dardanelles was skilfully used by the Turkish Empire against sixteenth century Venice, with whose naval strength Turkey could not compete. But as an offensive weapon the American embargo was a failure; while it had repercussions upon English trade, it injured New England commerce almost irreparably.

A more or less permanent embargo on particular commodities may be used as a preventive of war, revolution or other undesirable international phenomena. To this type belongs the law empowering the president of the United States to prohibit the export of arms or munitions of war to American countries where conditions of domestic violence exist. First passed in 1912 as a result of the revolutionary disturbances in Mexico, the law was immediately applied to that country by President Taft. In 1922 it was extended by statute to countries with which the United States had treaties of extritoriality—primarily China. The discretionary power given to the president under the law has sometimes been used to discriminate in favor of the established authorities and against the rebels. Proposals have been made to implement the Kellogg Peace Pact by similar provisions for embargoes on munitions of war.

The enforceability of an embargo clearly depends upon such conditions as the character of the commodities principally concerned, the configuration of coast lines, and the forces at the disposal of the country imposing it. In earlier times measures of repression were mostly not observed; both the preponderance in international trade of goods of high value but small bulk and

the weakness and corruptibility of state administration made for that result. The American measures from 1807 to 1811 are examples. In contrast with this stands the virtual isolation of the Central Powers in the World War. A remarkable modern instance of the efficiency of governmental action in this field is the possibility of preventing exports of coin and bullion; the impossibility of enforcing such a measure was considered almost axiomatic in mercantilist times.

EMERSON, RALPH WALDO (1803-82), American philosopher. Although he has been most widely read as an edifying essayist and has latterly come to be valued for his incisive and pattern breaking poetry, Emerson's chief importance is as a thinker. He was not a systematic philosopher and there is little in his metaphysics that cannot be found in Plato and Kant; yet his gnomic wisdoms do sum up to a philosophy and his atomistic utterances cohere somehow into a well defined point of view. While he believed with the transcendentalists in the existence of innate ideas that do not result from but transcend experience, he avoided entangling alliances with the transcendentalist movement as he did also with Unitarianism, Fourierism, perfectionism, abolitionism and all the millennial and humanitarian programs that shot up luxuriantly in the suppressed and crotchety atmosphere of New England society. He wanted freer air to breathe than he could find in any sect, creed, cult or movement. For all his pride in being rooted in his provincial soil, he was more truly a citizen of the world than of Massachusetts. His intellectual coming of age dates from his first trip to Europe, where his exposure to

the thought of Goethe, Carlyle, Coleridge, Wordsworth and Landor vitalized into a *Gestalt* strands of influence deriving from sources so diverse as Platonism, Protestantism, romanticism, Swedenborgian mysticism, the sacred books of the East and homely Yankee observation. The resulting configuration became, on his return to Concord, a sharp cuneiform instrument for valuations which he impressed on the soft clay of contemporary American life.

With a godlike aplomb Emerson set himself to rethink his world afresh; with an almost flagellant anxiety he lay in ambush for his materials, surprising every stray perception and intuition, setting them down in his journals and hammering out of them finally his completed lectures and essays. He became the center of an intellectual renaissance in New England. Displaying a characteristic sanity he sought the sources of new energy within the same confines of American life where he found exhausted traditions and sinister growths. It is that which accounts for the dual aspect of his thought as a criticism of his times and an exploration of the new America. He denounced the spiritual barrenness of American life, its growing materialism and acquisitiveness, the narrowness of sect and party, the deadening effect of institutions, the clinging to European traditions and the obedience to the voice of authority. While he lacked Carlyle's capacity for moral indignation—he substituted for it a peculiarly irritating oracular tone—Emerson must be ranked with him as a great ethical critic of society.

But the whole tendency of Emerson's being lay not toward criticism but toward affirmation. The most insistent note of affirmation that he sounded was an intellectual and ethical individualism—what William James summed up as "the sovereignty of the living individual." Without being aware of it, Emerson was fulfilling in his thought the deepest meaning of the Protestant Reformation—designating the individual as the unit of judgment and interpretation. From this central preoccupation lines may be drawn touching every important doctrine at the periphery of Emerson's social thought. The individual must choose his own calling, guide his own conduct, form his own opinions, construct his own religion, even fashion his own history. Nothing is important except as it is relevant to his purposes; nothing is sacred except his own mind; he can learn nothing except as he himself relives it. Standing at the conflux of time he has at his disposal the social heritage of the past and

Encyclopaedia of the Social Sciences

before him a future bounded in its possibility only by his own creative imagination.

Doctrine such as this shot like lightning through the dour Calvinist atmosphere of New England; it fitted the mood of a pioneer society in the west; its easy harmonies were welcome in a country threatened by sectional struggle; there were even aspects of it that could be found to meet the needs of an emerging industrial society. In fact, it was the tragedy of Emerson's teaching that it could be turned about to serve purposes he never dreamed of and causes he would have abhorred. That conception of society as dynamic and experimental which is the most permanent and valuable element in his social thought—that at every moment society must start afresh with a clear field and no shackling traditions—was lost sight of. What was chiefly heeded was his buoyant and almost unctuous optimism. His opposition to state coercion, amounting in his own thought almost to philosophical anarchism, has gone to support *laissez faire*. His emphasis on the sovereignty of the individual has strengthened ballot democracy. His ethical individualism has furnished a basis for economic individualism. His doctrines of self-reliance and opportunity are excellent homilies on the prevailing virtues of a capitalist economy. The denial of the existence of evil and the principle of compensation can be used to bridge inequalities of income and social status. While Emerson was still engaged in building his doctrine the industrial revolution came to America and turned all the social consequences of his precepts topsy-turvy.

Beyond this his chief weakness as a social thinker lay in his overestimate of the role of the individual in the social process and his underestimate of the place of the institution. This vitiates, for example, whatever theory of history may be found implicit in his *Representative Men*. His *English Traits*, however, is a brilliant study in the dangerous realm of national psychology and makes a much juster estimate of the force of tradition. But throughout his thinking one feels that his world was not a society but a collection of individuals. He did not offer, nor did he envisage the need of, any mechanisms whereby individual judgments would add up to a social judgment or individual creativeness be translated into social action.

EMIGRATION is a process by which an individual or a group voluntarily leaves one culture area for the purpose of settling elsewhere. Since it assumes the existence of a culture area with rather clearly defined boundaries out of which the migration takes place, it does not apply to such movements as those of migrating tribes who carry their culture with them. In modern times this area is commonly the national territorial state, although when persons of very limited horizon whose entire culture is located within a single valley or village move to some other place in the same political state they should more justly be considered emigrants out of valley or village than migrants within the larger unit. Emigration assumes a more or less free act of choice, in contrast with such essentially different processes as exile or enslavement, although indentured servants pressed into service and debtors or felons offered the alternatives of emigration or imprisonment are distinctly border line cases. It involves a definite process of uprooting and rerooting, not simply the temporary departure and casual contact of the traveler or trader.

Emigration has been a principal condition of western life since the sixteenth century, making possible the extension of European territorial empires and areas of cultural influence, permitting reassortment of populations in response to geographical or cultural factors and offering at least a partial solution for countless national and personal problems. Since the war of 1914-18 the

free flow of populations has been largely checked by the restrictive measures of various governments; and the world, so long accustomed to international mobility, is forced to adjust itself to a condition where such mobility has been very greatly reduced.

Emigration most commonly occurs when a condition of maladjustment arises. It is characteristically an act of escape. In very rare cases the motive may be a patriotic or missionary one, to extend an empire or propagate a faith, but the overwhelmingly dominant influence is the thwarting of an individual or group. Those who emigrate are those who are badly adjusted to the culture pattern of their home group. The successful do not emigrate. The very terms in current use attest this fact, for when persons of position make their home abroad—writers or artists in Paris, professors in foreign institutions—they do not become “emigrants”; shunning the social stigma attached to that term they call themselves instead “expatriates.” Nor do the satisfied emigrate. Only those able to conceive of something more desirable than that which their own culture area offers them uproot themselves and leave. Most frequently the dissatisfaction is an economic one, but political and religious discontents play their parts, while the oppression of racial and cultural minorities was responsible for much of the emigration from Europe in the decades before 1914. Maladjustments of various types are often closely intertwined. The early New England settlers could probably not have honestly told whether their economic ambitions or their religious hopes had propelled them more forcibly from their native land. The poverty stricken Polish peasant who came to America to garner a harvest of gold was not free from the supplementary desire to escape Russification, while the Jew who sought to exchange the ignominy and terror of the Pale for the equality and security of the promised land was quite as concerned with his economic as with his civil status.

Periods of rapid social change, which almost inevitably throw some portion of the community out of gear, are most fruitful of emigration movements. A transition from one type of economy to another is probably the most dislocating of all changes, undermining as it does the sources of income, the bases of security and the foundations of the social structure on which the changing society has largely rested and producing an appearance of overpopulation by reason of the large numbers for whom the

system has not yet found a place. This was the situation in England at the opening of the seventeenth century when the multitudes of vagrants and “sturdy beggars” turned out of house and trade by the beginnings of capitalist agriculture and capitalist industry lent credence to the contention that the country was overpopulated and immensely stimulated emigration.

Almost equally disruptive, however, are major changes in economic conditions although the economic system of an area may remain unaltered. When the Polish farmers were ruined by the competition of American wheat in the 1880's, the Poles became an emigrating people. There is a noticeable tendency of emigration to follow the swing of the business cycle. Crop failures such as the Irish potato famine of 1846 have impelled emigration, as has the destruction of economic resources by the hand of man. To the ravages of Louis XIV in the Palatinate has been attributed much of the German emigration to America in the eighteenth century.

Maladjustment other than economic is equally likely to be the product of radical social change. The sects produced by the Protestant revolt for whom no place was made in the terms of settlement found emigration their only alternative to abandoning their faith. Separatists and Quakers in England, Pietists in Germany and Huguenots in France all chose to seek their fortunes in other lands. Except in times of change, at the founding of a new sect or when some stimulus produces active persecution, emigration for religious reasons is rare. Once a *modus vivendi* has been established, even a religious minority is not likely to resort to emigration. It may be that if the *modus* is not altogether satisfactory a more favorable possibility may attract the group away. Mennonites who had long lived with comparative satisfaction in Canada and the United States were induced to emigrate to the Gran Chaco by the guaranty of the Paraguay government that they would no longer have to sacrifice their pacifist principles. In the political field radical change rather than chronic unrest precipitates emigration. Whether a revolution succeeds or fails, one side or the other, be it French or Russian émigré or German “forty-eighter,” is almost sure to find in another land his only opportunity for continued activity if not his only chance for survival. Racial and cultural minorities in their turn are driven to depart by active persecution, not by the mere presence of disabilities. Movements of Jewish populations have been so stimulated from the time of the Dias-

pora, and the exodus of Armenians from modern Turkey has been motivated in the same way.

Frequently accompanying economic, religious or political maladjustments but distinct in itself is the psychological factor of a broadened cultural horizon. So long as individuals or groups remain satisfied to follow their parents' ways and their horizon is restricted to their accustomed round of life, emigration is unlikely to occur. On the other hand, the press, radio, travelers, the extension of education, all have power to produce emigration through creating discontent with an otherwise unchanged lot. Not poverty alone but the conception of a fuller life has driven Italian peasants by the hundreds of thousands from their beloved land of sunshine and wine; the Jews who left Russia were not only those who had suffered from active persecution but many more who had heard of a chance to live with more freedom and dignity.

Emigration, however, as a solution for the various types of maladjustment described above depends upon the availability of some other accessible and desirable place. Such a place must at least be thought to offer those things which are lacking in the old environment, without requiring the sacrifice of such features of the old culture as are most cherished. The nature of the place of immigration and the suction created by its attractions may even become as potent an influence as the pressure to escape. Stories of El Dorado have made many families ready to believe that their lot could and should be mended and have sent them out from communities where their adjustment was comparatively good and their position secure. Yet if the conditions of immigration do not meet the needs of the potential emigrants, even subsidies have not the power to make settlers go out. With conditions in post-war England strongly favoring emigration, with generous assistance offered by the government, with the advantages of emigration extensively advertised and with ample space in the dominions for settlement, there has been comparatively little emigration from England during this period. The maladjusted population is industrial and either is unwilling to take up agriculture or is unwelcome in the dominions for lack of equipment to do so.

When factors producing emigration from a given country have continued over a period of years, emigration may become part of the culture complex of the emigrant sending country. In Ireland many generations of constant emigration have made the process part of Irish national

life. The Free State finds its efforts to revive the ancient Irish tongue impeded by the refusal of children to learn a language which will do them no good when they go to America. A mother assumes that six of her seven children will leave her for distant homes across the sea while the seventh remains to carry on the farm with the aid of money from abroad. The traditional songs are the songs of emigrants and the angry father in the typical popular play threatens to "emigrate" his son.

Impelled to depart and furnished with a place to go, emigrants still await a means of making the shift. There must be a method of transportation sufficiently cheap and convenient to meet their needs. Without cheap steerage passage poverty stricken peasants of eastern and southern Europe could not have negotiated their transfer to western shores, while post-war Britain has realized that without state aid transportation costs would be an insuperable obstacle to her scheme of sending settlers to the dominions. For large scale emigration, moreover, there must usually be some agency for organizing the exit and providing for adaptation at the other end of the journey.

Most commonly, at least when emigration from a locality is new, the process is a group process rather than an individual one. Only when the machinery has been established and the path well trodden does it become easy for individuals to move alone. The initial process tends to follow a certain pattern, typified by the seventeenth century agencies which facilitated emigration from England to the new world. A promoter or group initiates a scheme, sells the idea of emigration to potential emigrants and to financial backers through some form of publicity, provides or contracts for means of transportation and finally makes or purports to make some provision for placing the emigrants in their new homes. Such promotion schemes have been notorious for their failure to fulfil both their promises of financial return to the backers and of adjustment at their destination for the emigrants. Emigrants lend themselves readily to exploitation, since in breaking their ties with the system and culture that they know they lose the support of their social position and exchange the self-confidence that rests on familiarity for the bewilderment of a new environment.

Organizations facilitating emigration may be of several types: companies such as the Virginia Company and the "Mississippi Bubble" formed

to make a profit from the colonizing enterprise; groups such as certain religious sects organized to negotiate a particular venture on a non-profit basis; and private agencies such as steamship companies which facilitate emigration as part of a general business and regard emigrants simply as lucrative cargo. In many, probably most, cases, some financial aid is necessary, for emigrants as a class are characteristically poor. Where the emigrant organization seeks to be a money making concern the emigrants themselves may be regarded as stock in trade and may receive their passage, as did the first Virginia settlers, by "adventuring their persons." Elsewhere passage may be financed in return for a promise of work. The bulk of emigrants to America in the eighteenth century came as indentured servants, aided by shipper or planter, under contract to work out their passage for a number of years in their new home.

Where emigration becomes a matter of public policy, direct aid from the home government or private home organizations may be offered. The British Parliament subsidized the Georgia colony as a dumping ground for undesirables, while Wakefield's colonization scheme to rid England of her surplus population after the Napoleonic wars called for both public and private funds. Subsidies from the country of ingress are also provided in the form of special inducements to enter newly developed territories, such as Canada and the Argentine. Private companies too offer assistance, as did the American railroads in opening up their western territories or the New England textile firms in importing French Canadian mill hands. Undoubtedly the greatest source of aid, however, is the volume of private remittances from former emigrants who have made a financial success in the new home and furnish the means for friends and relatives to follow them. For over seventy-five years Irish emigration to the United States and Canada has been financed in this way.

The effects of emigration movements upon both sending and receiving countries may be most favorable or most unfavorable. In any case they are profound. Emigration may be a powerful aid in the solution of a nation's problems, relieving it of the burden of its economic and social failures or facilitating processes of change. The industrial revolution in many countries has come with less friction and less hardship because only part of those dislocated from their old way of life have had to find their place in industry, while the rest have been able to escape by the

"safety valve" of emigration. Agrarian distress in older communities which is incident upon the opening of virgin territory to world exploitation has been mitigated by the chance to emigrate from suffering areas to these more favorable lands. On the other hand, emigration may so drain a country of its man power as seriously to reduce its vitality. When a whole community becomes so far unable to meet its economic or social problems that it habitually expects its more energetic citizens to emigrate or when an ultraconservative society forces out its progressives and its liberals, emigration is a blight rather than a boon. In any case, a country which furnishes emigrants in large numbers over a long period is almost necessarily carrying a heavy financial burden. The age at which persons are most apt to migrate is early manhood, just as they are entering their period of greatest usefulness. The country of egress has borne the cost of their rearing during their non-productive years. The country of ingress receives the full benefit of their labor without cost of education and support. In part this financial burden may be balanced by the volume of emigrant remittances and the burden of support in old age, but the balance is most unlikely to lie in favor of the emigrant sending country.

Emigration is probably the most effective means by which a country can extend its dominion. Political empires have been built by this means from the time of the Greek city-states if not before. The English, French and Spanish empires in the seventeenth century were built in varying degrees in this way, and England's triumph over France in the New World is commonly attributed to the fact that the former possessed emigrant and not merely administrative colonies. It remains to be seen whether the fate of Manchuria in the twentieth century will be determined by the emigration of Chinese settlers or by the military and political forces of Japan or Russia. In the extension of a financial domain emigration also plays a part, accompanying and facilitating the export of capital. With the exception of a considerable emigration to Canada emigration from the United States has been made up almost exclusively of representatives of American firms established abroad. On the other hand, the export of capital may itself act as a boomerang, forcing further emigration when goods produced with this capital abroad enter the home market and dislocate home industry. Such has been the fate of England in the twentieth century.

Cultural colonies, however, are as much the product of emigration as are political. Although the American states ceased to be a part of England's political dominion they remained in large measure members of her cultural empire. In this same sense New France was not destroyed by the victory of England in the colonial struggle but may be said to have survived as a cultural entity. Even such a culture area as the Ukraine, which has only with difficulty maintained its cultural identity, has become the center of a culture empire through sending out its emigrants, until in certain parts of western Canada Ukrainian emigrants boast that even the Indians speak Ukrainian. The degree to which emigrants become the extenders of culture empires depends on the divergent or conflicting culture with which they come into contact, but even the vigorous Americanization program of the United States has not been able completely to destroy the culture of her immigrant groups or to prevent them from introducing their religious and their social patterns into the land of their adoption.

Powerful though emigration is as a means of extending political, cultural and financial dominions its effect must not be overrated. It is an open question whether Europe has not been more "Americanized" in the twentieth century by movie, radio, ten-cent store goods and the rationalization of industry than America has been Europeanized through the process of emigration.

The control of emigration and immigration has been regarded as a problem of domestic policy, not a matter for international settlement or outside the field of state interference. Fascist Italy and Soviet Russia have been as insistent in controlling emigration as has the United States in restricting immigration. The latter country, not satisfied with the "gentlemen's agreement" by which the Japanese government agreed to prevent the emigration of Japanese laborers, passed an exclusion act for the declared purpose of demonstrating the domestic character of the problem. In spite of these claims, however, the consequences of emigration are not simply national in scope. Whether it be a matter of making available new natural resources and throwing the product on to the world market (*vide* the effect of Italian emigration to the Argentine on the world supply of wheat), whether it be a necessary condition of world economy based upon the assumption of the mobility of labor or whether it enter into the problem of

international finance, international movement of population cannot be dissociated from world economics. On the other hand, only those who hold that the state is rightly sovereign over all the acts of the individual can admit the restriction of personal mobility by state decree.

For in the last analysis emigration is an individual matter growing out of an individual's reactions to his own community. It is to the individual, moreover, that the process means most, for there are few actions of more far reaching significance in a person's life than the act of emigration. For the process of migration from one culture area to another leaves the individual in large measure culturally stripped and bare. Much that he learned in his old home is useless, irrelevant or hampering to him in his new. There is much in his new home that he can never understand and never make part of himself. In some measure he inevitably seeks to build his new life according to the pattern of his old, even though his exodus has been an act of escape. Often the old pattern and the new environment are incompatible. In these circumstances one of two situations is most likely to develop; either the process of emigration involves definitely a cultural loss, or it produces an overemphasis of that particular factor which could not find adequate expression in the old environment and whose satisfaction was sought through emigration. The excessive Puritanism of the New England fathers represented a focusing upon the cause of their dissatisfaction and the one aspect of their culture which could be carried on in the wilderness, while the rest was sacrificed. In fact, the present materialism of the United States may perhaps be attributed to the same influence—the concentration upon material success on the part of emigrants whose move was prompted by economic dissatisfaction and whose quest for gain came as compensation for the loss of their cultural heritage.

EMINENT DOMAIN is the right to appropriate property for public uses. The term conveys some idea of ultimate or paramount ownership in the sovereign; this quasi-feudal notion has received formal expression in the constitutions of New York, South Carolina and Wisconsin but may be ignored. Eminent domain is simply an attribute of sovereign power supposed to be tempered by a principle of natural law which connects its exercise with a duty of compensation. To say that the right to take is inherent in sovereignty and the duty of compensation a positive limitation imposed by constitutions [*Boom Co. v. Patterson*, 98 U.S. 403

(1879); *United States v. Jones*, 109 U.S. 513 (1883)] is to ignore the history of the doctrine, which always linked up the duty with right. Grotius names as the two requirements public utility and, if possible, compensation (*De jure belli ac pacis*, Liber II, ch. 4, sect. 7); this was reiterated in the French Declaration of Rights of 1791; and Blackstone mentions as one of the safeguards of private property that its taking for the good of the community requires the sanction of an act of Parliament, which will be given only upon condition of full indemnification (*Commentaries* 1, 139). The Supreme Court of the United States at present regards taking, even for public use, without compensation as a violation of due process, so that the state is restrained in this respect by the federal as well as by the state constitution [*C. B. & Q. R. R. Co. v. Chicago*, 166 U.S. 226 (1897)].

American constitutions generally contain some provision relating to the power of eminent domain, usually by way of limitation but occasionally by way of enlargement. The occasions for enlargement have been furnished by doubts as to what constitutes a public purpose, particularly whether expropriation for drains and ditches and private ways is permitted and more recently whether excess condemnation could be sanctioned. Where the constitutions particularly name certain public purposes, this seems likewise to be for the purpose of removing doubts and is not intended as exhaustive enumeration. Express limitations on the power relate to the following matters: making the public nature of the purpose (also in very few states only the necessity of the taking) a judicial question; requiring compensation for damaging as well as taking property; determining the setting off of benefits against damages; restricting the taking to an easement; specifying the tribunal for the award of compensation (jury or commissioners); and governing the time for compensation.

In the United States the power of eminent domain belongs to the federal government as well as to the states; but under the federal constitution the United States exercises exclusive legislative jurisdiction only over places purchased by the consent of the state legislatures, and it was probably for this reason that for a long time the United States, when necessary, procured condemnation through state action [*Kohl v. United States*, 91 U.S. 367 (1875) p. 373].

The exercise of the power of eminent domain

may be delegated and commonly is delegated to local governmental bodies (cities and other local districts) and to private corporations, particularly to railroads, telegraph, telephone and water companies. But although the United States since 1920 has assumed full jurisdiction over new railroad construction serving interstate commerce it has not undertaken to confer powers of condemnation for that purpose, and these consequently depend upon state authority—an anomaly which could be easily remedied by legislation if inconvenience should result therefrom. The aid which the transcontinental roads first received from Congress was in the form of grants of public lands. The original act of July 1, 1862, did not provide for expropriation; the power was, however, given by an act of July 2, 1864 (13 Stat. 357).

Condemnation may be authorized by legislative act for each particular enterprise separately. This method is the one chiefly pursued in England, but in America there are general statutes permitting the exercise of the power for specified purposes without reserving to the legislature a judgment as to the merits of a particular undertaking. When, however, a city or other municipal corporation comes to exercise the delegated power it does so by special legislative act for each case, without further delegation to administrative authorities except for preliminary examination and report in accordance with the provisions of general statutes regulating the making of public improvements.

Whether the purpose for which it is proposed to take property is a public purpose is in the United States a judicial question. Since compensation is paid, the public interest is liberally construed; the promotion of beauty or of national sentiment may warrant the exercise of the power of eminent domain where it would not warrant the exercise of the police power [*United States v. Gettysburg Electric Ry. Co.*, 180 U.S. 668 (1896)]. A number of courts have held that a way of necessity or the drainage of wet lands does not constitute a public purpose; but constitutional amendments have enlarged the power in view of these decisions.

Where a legislative act itself specifies the property to be taken (the public nature of the purpose being conceded), this constitutes a conclusive determination, allowing the owner no right to be heard as to the legitimacy or wisdom of the choice. Where the legislative act delegates the exercise of the power it may provide for a judicial determination of the question of the

necessity of the taking, and occasionally (e.g. in Wisconsin; in New York only when the taking is for a private road) there is a constitutional provision to that effect; but many statutes regulating the exercise of the power fail to make any provision for contesting the choice made by the expropriating corporation. Under the Act of Congress of March 1, 1929, relating to the acquisition of land in the District of Columbia an expropriation on behalf of the United States may assume the form of a "declaration of taking," upon which a right to compensation vests in the owner; and it is only this right to compensation which constitutes the subject of the judicial proceeding. General acts providing an appropriate procedure for the exercise of the power of eminent domain are common; the Supreme Court of the United States has held that a condemnation proceeding is a suit at common law within the meaning of the statutes granting jurisdiction to the inferior federal courts [*Kohl v. United States*, 91 U.S. 367 (1875)].

The appropriation of parts of lots for public streets (and particularly for the widening of streets) not infrequently leaves in the hands of the owner a remnant which is of little value to him, thus entitling him to a compensation larger than the value of the part taken. If his entire lot could be taken, remnants might be combined into suitable building lots; but technically this would not be taking for a public use. This situation has suggested the idea of what is called excess condemnation. An express constitutional authorization of this is generally deemed indispensable and is now provided for in the constitutions of several states (Massachusetts, New York, Ohio, Wisconsin). Even with such recognition there remains the question of "due process" under the federal constitution, and the Supreme Court had up to 1931 left the question open [*Cincinnati v. Vester*, 50 Sup. Ct. 360, 281 U.S. 439 (1930)]; a favorable decision may be expected with reasonable confidence.

Where expropriation is made for highways, the public purpose may be satisfied by an easement, leaving the fee by way of reversion in the owner. Difficult questions have then arisen whether the placing of rails, pipes or poles upon or under the highway constitutes an "additional servitude" calling for further compensation. Upon discontinuance of the highway, reversion to the adjoining owner ordinarily represents the most convenient arrangement; if therefore for technical reasons the fee or the reversionary

interest has not been carried by "mesne" conveyances, the result may be an extremely undesirable revival of ownership in the heirs of a former proprietor without any substance of equity. The situation can be managed (although not always retroactively) by appropriate legislative provision (e.g. the Illinois Vacation Act of 1923); but notice has to be taken of constitutional provisions which forbid more than an easement to be taken for railroad tracks (Illinois, Missouri, Oklahoma, South Dakota).

The laying out and particularly the subsequent improvement of highways not uncommonly involves a change of grades, which by leaving adjoining property above or below the new street level impairs rights of access and communication. After a number of courts had pronounced this to be "consequential" injury, falling short of a taking of property, express constitutional provision was also made for compensation for property "damaged" by public use. The Illinois provision of 1870 in this respect has since then been followed in many other states. Such a provision may also become applicable if the vacation of a street or public place equitably entitles to compensation. But necessarily the problem of injuries so indirect or remote as to place the right to compensation in doubt must be determined by the application and elaboration of general principles which cannot be compressed into a brief formula. Neither constitutional nor statutory provisions can give much aid toward a solution; they secure the appropriate tribunal (jury or commissioners), acting subject to judicial instruction or review, but refrain from particularizing as to measure of damages. A number of constitutions (the majority of them only if the taking is by a private corporation) provide that resulting benefits are not to be set off against damages; but in case of public local improvements which are financed by special assessments the offsetting of benefits against damages is the regular course, leaving normally a balance chargeable as a special benefit assessment against the owner; and statutes sometimes expressly require compensation to be reduced by benefits, as in connection with river and harbor improvements made by the federal government (33 U.S. C. § 595).

There is ordinarily no difficulty in distinguishing the power of eminent domain from other powers under which a sacrifice of property interests may be imposed or demanded. This is particularly true of the taxing power; even where in connection with local improvements expro-

priation and assessment of cost for a highway are closely blended in the same proceedings, the two powers are clearly distinguishable. The term condemnation is commonly used to designate the taking for compensation; but it may also be used to designate the confiscation of forfeited property, which is an act of justice, or the destruction of dangerous property, which is an act of the police power.

Difficulties begin when it is attempted to draw a sharp distinction between the police power and the power of eminent domain, largely for the reason that the test of compensation or no compensation is apt to fail or to create confusion. It is commonly held that where property has to be sacrificed to overriding claims of public safety, health or morals no compensation is payable; and the inevitable judicial recognition of this principle, as a matter of constitutional law, in cases where the legislature has made no provision for compensation has tended to obscure inherent equities. The Supreme Court has ruled, for instance, that property is held subject to a continuing public power to subordinate it to public uses; e.g. that by virtue of its power of regulating commerce the federal government may make river and harbor improvements in the interest of navigation without liability for compensation for the removal or damage of existing structures [*Greenleaf Lumber Co. v. Garrison*, 237 U.S. 251 (1915)]. In such a case the equitable claim to indemnification is extremely strong; it is hardly less so if property is destroyed to check the course of a conflagration or if exposed herds of livestock are killed to check the spread of contagious disease; it seems even stronger if cedar trees are destroyed to protect apple orchards [*Miller v. Schoene*, 276 U.S. 272 (1928)]. In all these cases there is no appropriation, no transfer of title to the public and hence no exercise of the power of eminent domain giving rise to a claim to compensation. Nevertheless, although such cases are held to involve only exercises of the police power, considerations of equity may induce the legislature to provide for compensation, and this has been done in cases of conflagration and cattle disease. Since, however, the right to compensation is not then a constitutional right, adjustments may be made that are more equitable to those who have to bear the burden of compensation; and the recognition of the difference of powers is an advantage in this respect.

In the practise of city planning the power of eminent domain applies in special forms and

also in close connection with other powers. Reference has already been made to the problems presented by the regrading of streets and by street widening which results in economically useless remnants of lots. In the laying out of new streets taxation in the form of special benefit assessments overshadows the damages payable by reason of condemnation, but special difficulties arise where building is prohibited by reason of a street plan the actual execution of which is indefinitely delayed [Forster *v.* Scott, 136 N. Y. 577 (1893); Matter of City of New York, 196 N. Y. 255 (1909)]. Another question is presented by the enforced setback of houses in residential streets. Bulk restriction in connection with the building development of a lot is a legitimate exercise of the police power if it is a matter of providing adequate light and air; but the extent of the compulsory setback is very apt to be in excess of sanitary requirements, and if compensation is to be denied, a power wider than the traditional police power must be recognized in connection with city planning. If the aesthetic or monumental character of a particular site calls for special adjustments of adjoining properties in the way of reduced and uniform heights of buildings, the resulting restrictions should be looked upon as condemnations by which the public appropriates an easement, and compensation should be payable; this appears to be the better doctrine [compare Attorney General *v.* Williams, 174 Mass. 476 (1899) with Parker *v.* Commonwealth, 178 Mass. 199 (1901)]. In England, where constitutional limitations do not enter into the problem, the question of compensation or no compensation is largely determined by the opinion of the minister as to the reasonableness of restrictions for town planning purposes (Town-Planning Act, 1925, § 11).

Restrictions placed on particular pieces of property by reason of the national value which they have as historic or artistic monuments should be regarded as constituting expropriation *pro tanto*, with consequent claim to equitable compensation. This seems to be recognized by the French Act of December 31, 1913; there is no corresponding American legislation.

To what extent may vested rights be impaired without compensation in connection with social and economic reforms? If the impairment applies to an entire category of rights, all owners within the category being affected in the same way, the equity of compensation assumes a totally different aspect from that of the ordinary

expropriation for public use, and it must be doubted whether constitutional provisions are applicable. The abolition of slavery and the prohibition of the liquor traffic destroyed vested rights on a large scale and without compensation; but in both cases the effect was accomplished by provision written into the federal constitution, thereby making a judicial issue impossible. Before the Civil War, however, the abolition of slavery was mainly discussed on the basis of compensation or as a prospective measure to be applied to the unborn issue of slaves; in addition, moreover, the Thirteenth Amendment had been preceded by emancipation as an exercise of the war power. As far as the Eighteenth Amendment is concerned there was ground for contending that because the liquor traffic had been carried on under revocable licenses the whole business had the status of something existing at mere sufferance (*Mugler v. Kansas*, 123 U.S. 623 (1887)).

In Europe such problems have been particularly discussed. In England emancipation was effected by partial but not total compensation. European opinion seems to hold that liquor prohibition requires compensation. However, the practise as to compensation in connection with the abolition of feudal rights and with agrarian reforms has varied. Large scale reform would frequently be impossible if conditioned on full compensation; and Irish and English rent legislation has without compensation curtailed what at the beginning of the land agitation were held to be the just property rights of the landlords.

In American railroad legislation the recapture of excess profits may be regarded as a form of taking property without compensation. Should the public welfare require the suppression of eleemosynary trusts that have outlived their usefulness, compensation would in the nature of things be impossible. The United States protested against but ultimately acquiesced in the legislation of Mexico which declared subsoil minerals, including oil, to be the property of the state. American courts may hold such a restriction of the content of a right of property to be inconsistent with the American constitutional guaranties on behalf of property; if this position is sound it means that such alteration of the content of property can be effected only by constitutional amendment, for to say that under the constitution it can be done only on payment of compensation is to state a futile proposition not responsive to the supposed practical need.

Under American constitutional terminology eminent domain means the taking of property for public use on payment of compensation. This involves the converse proposition that private property may not be taken for public use without compensation. It is conceded that the destruction of property under the police power, although without compensation, is not taking without due process. What taking does the police power justify? Does it under any circumstances justify a taking which is not destruction but appropriation or transfer? In view of the recapture provision of the Transportation Act of 1920, the answer cannot be an unqualified negative. Where then under American constitutions does the sovereign power over property find its limits? The Supreme Court alone can answer this question. If the answer is progressively liberal in favor of public power to satisfy progressive community needs or demands, a distinction must be made between two kinds of expropriation which are also, at least in a qualified sense, appropriation or transfer: the kind that requires compensation and the kind that does not require compensation. It will always clarify the discussion of public powers if the term eminent domain is confined to the expropriation to which the principle of compensation is properly applicable; but only the development of social legislation can determine to what extent the uncompensated curtailment of property rights is justifiable or legitimate.

Gendín, S., *Expropiación forzosa, su concepto jurídico* (new ed. by C. Martín Retortillo, Madrid 1928), which gives further references not only to Spanish but to French and Italian literature.

EMPIRE. There have been two concepts of empire and the word has been used in two ways. In a narrower sense the term corresponds to the Latin *imperium* and signifies a large kingdom or world state of vast dimensions, multiplicity of constituent parts and great might, like the Persian, Alexandrian, Roman, Chinese, Carolingian and Napoleonic empires and the present states of England, United States and Russia. In a wider but looser sense the term empire is used to refer to every monarchy which is closely unified and powerfully developed both internally and externally.

Of the five stages into which the history of mankind may be divided only one, that of the most primitive society, is entirely devoid of the appearance of empire even in the widest use of the term. The influence of the powerful and rich development of the kinship state in the last stages of primitive society, exhibited particularly by the Iroquois Indians, is really responsible for this absence of a fully formed monarchy and for the existence of a mere chieftainship and in exceptional cases of an embryonic form of monarchy. Considerable precautions were taken in this form of political organization by means of the admixture of democratic and aristocratic sentiments and institutions to forestall the rise of the kingship. In this these societies were successful, although a comparison with the development of the narrowly exclusive kinship state of Japanese antiquity (before the Taikwa code of 645) indicates how easily a kingdom might have arisen. The work of Lewis Henry Morgan, however, has demonstrated that at least all the powerful primitive peoples as well as the fully developed societies in their prehistoric period have undergone this or a similar course of development. In some instances, as among the Teutons, this approached a somewhat loose form of kingdom which was really a forerunner of the powerful monarchy of antiquity.

Empire, in its wider sense, is really a product of the second stage of growth, the so-called youth of mankind. The dominant spiritual powers of the most primitive period were imagination and feeling, the softer and at the same time the more natural forces in the realm of the inner ego. But with the coming to the fore of the stronger and harsher forces of will and reason there came also the creation of the state and, in the culmi-

nating stages, of empire in the narrower sense of the term.

A preliminary stage to the monarchies of the great civilized peoples is represented by the kingdoms of the more advanced Negroes in Africa, both the Bantu peoples of the south and some of the natives of the central zone between Fulah and Somaliland. This type of kingdom is barbaric and quite crude and primitive in its institutions, but in a number of selected instances it exhibits many similarities to the earlier forms of the old Egyptian and Carolingian governmental structures. Among these Negro tribes the most complete structural varieties of the early, maturing and truly archaic types of kingship were perfected. They range from the village chieftaincy of the Ewe type (in former German Togo), which comprises only one settlement, up to great kingdoms like the Lunda or Barotse empires.

The village chiefs of the Ewe have bodyguards who precede them in procession and force each passer-by to do them reverence. Above the village chief stands the tribal chief. His rank is inherited in his kinship group and within this group he is selected by the village chiefs. His relationship is patriarchal in character, but the administration of his retainers is harsh and severe. West Africa is the classic land of little Napoleons; of great chiefs and kings who by personal initiative raise themselves to royal power, but whose dominion vanishes again with their death. Central and south Africa have also produced numerous kingdoms of great dimension and long duration.

In the great kingdom of the Barotse, which was formerly a patriarchal tribal kingdom, the monarchy developed into a despotic personal rule. Before 1890 it was estimated that eighteen major and eighty-three subsidiary tribes had been subjected and brought within the kingdom. The king's power, formerly limited in many ways, is today in spite of the abundant survival of older usages completely supreme. He is both the commander-in-chief of the army and the chief magistrate. In addition to his political control he also possesses a formidable degree of economic power. He exercises control of a large part of the volume of trade, including the goods most in demand, and has a royal monopoly of such commodities as rubber and ivory. At his disposal he has a large bureaucracy headed by a chancellor of the realm. The village magistrates form the predominant class among the officials and the most favored of these enjoy the power

of district governors. Many of these magistrates also occupy positions in the central administration at the court. They are appointed to various departments by the king and exercise a limited authority throughout the realm. Such an official is, for example, the minister of foreign affairs of the south. The private court officials of the king, including the chief executioner, are more powerful than the state officials and have more weight in the counsel of the king. The *pitso*, or folk assembly, is of negligible significance. There is an official school at which the future assistants of the king are trained from their early youth.

The kingdom of the Lunda is much more extensive than that of the Barotse but more loosely organized and does not possess the strictly centralized despotism characteristic of the latter. The power of the *muata janwo*, or head king, is very great and is restrained only by the power of the *lukokesh*, the sister or half sister to the king, who, like the *muata janwo* himself, must be a descendant of one of the two chief wives of his predecessor. But although, according to reliable Portuguese accounts, this empire was in existence as early as the sixteenth century, the power of the conquered head chiefs and chieftains is still preserved and comparatively great.

During the period of its independence the organization of the Zulu tribe, the chief tribe of the Kaffirs, revealed a highly developed political sense. It was a severe military monarchy which yoked the entire energies of the people. The kingship was a restricted despotism, limited only by the authority of two powerful officials of a major-domo function, the two head *induna*, one of whom was the head of the army, the other the minister of state. The two head *induna* had within their jurisdiction important affairs of state, such as the declaration of war, verdicts of death and distribution of land. Together with the king they appointed the lower *induna*. The people had been converted into a thoroughgoing warrior state and were gathered together into great military camps or barrack cities of 6000 to 10,000 men. The young men were trained from early youth in the use of arms. They were forbidden to marry but allowed to retain concubines. The older men were allowed to marry and at times entire divisions of troops received the same privilege. The economic power of the king exceeded by far that of the Barotse ruler. He was lord of all the land and exercised a complete monopoly of trade and to him belonged the country's buffalo herds, its chief source of

wealth. An analogous institution is found in the ancient Norwegian monarchy under Harald Haarfager (c. 860-930). The proceeds from the buffalo breeding were devoted by the king to the supply of food, clothing and munitions for the army. He combined the functions of medicine man and head of a perfected judicial system.

Closely related to the Zulu is the warrior state of the Baganda in Uganda. Among them also each man is a soldier. The bureaucracy of head chiefs and chiefs is divided into two grades. Although both classes represent apparently the continuation of the old and previously independent chieftainships, the *watongoli*, or lesser chiefs, are subordinated to the *bakungu*, or greater chiefs. In the intimate life of the mass of the people it is, however, the *watongoli* who are all powerful. A sort of feudal relationship exists between the chiefs and the king. In case of war every *watongoli* is in duty bound to provide a certain quota of warriors. The king is lord over life and death but the great council headed by the *katikiro*, or prime minister and chief justice, and the *kimbugwe*, who is in charge of the king's umbilical cord, is also powerful. A traditional horrible cruelty and an extravagantly developed harem system are also characteristic of the Baganda kingdom.

The highest form of African monarchy is found among the Hova of Madagascar, who like the rest of the population of the island do not belong to the black race but represent an outpost of the Malays on African soil. Especially unique is the development of a lower bureaucratic nobility, not found in the political structures of the Negro kingdoms, in addition to the higher nobility made up of the descendants of the ancient chiefs and of the members of the royal family. Here too the ruler is the source of law as well as of all honors and punishments. As among the Baganda and the ancient Norsemen he is according to the law the possessor of all land. To him belongs all the produce of the soil not won by hoe or spade as well as all timber and minerals.

The group of early archaic politics thus far described reveals five general group characteristics. The expansion of states from small tribes or chieftaincies into greater empires proceeds within the particular communities by the combination of annexation and domination. The conquered chiefs become state officials and form a noble class. The state is fundamentally a despotism, although under weak rulers the royal power may be considerably limited. A central

bureaucracy is developed, consisting in most cases of the highest administrators and in the more advanced states of lesser officials with subordinate and departmental jurisdiction. Councils and popular assemblies are also at times evolved and the royal power is extended to the economic life of the people.

The fully developed archaic despotisms of the ancient Near East represent a second group of empires. The Old Kingdom of ancient Egypt (c. 3400-2475 B.C.), from its earliest history, consisted of two kingdoms. Lower Egypt, which represented the conquered territory, belonged directly to the king and was completely subject to his rule. The southern kingdom (Upper Egypt), on the contrary, was an aristocracy and relatively independent of the king. The state officials of the northern kingdom were wholly subservient to the king, and even more so were the great number of court officials. The nobility of the south was also at the outset dependent upon the king; but gradually they retired to their own possessions and, like the Merovingian counts, assumed the most important offices, made their positions hereditary and established themselves as practically independent princes. A similar but much more permanent and extensive encroachment on the royal power took place during the period between the Middle Kingdom and the New Kingdom at the hands of the Hyksos (c. 1675-1580 B.C.), who overran Egypt. The expulsion of the Hyksos and the establishment of the New Kingdom saw the development anew of a strongly centralized and military monarchy. The army became the dominant force in the state, and the king as its leader ruled supreme by means of a highly developed official bureaucracy. A large tax collecting organization grew up, the landed nobility slowly disappeared and in its place arose a new aristocracy of the army of petty functionaries who administered the local districts. Gradually, however, a new power, the priestly class, came to the fore and toward the end of the New Kingdom achieved supreme control of the state and converted it into a theocracy.

The empire of the Babylonians was, like Egypt, evolved from principalities and small kingdoms and grew in proportions by constant conquest. The rulers of these conquered states, known as *patesi*, sank to the role of local governors. The emperor accorded himself the prepotent power as lawgiver and chief judge of his people. He interfered continuously in the decisions of his officers and maintained a high court

of appeal at Babylon. Whereas the earlier emperors represented themselves as gods, the later ones like Hammurabi called themselves merely the favorites of the gods. The army was a standing force of professional soldiers who were in duty bound to appear at the command of the emperor; from time to time they were given leave. In contrast to the situation in Egypt, where the emperor remained sole lord of all land and property, the kings of Babylon began the system of compensating their soldiers with inalienable rights to land, cattle and personal property. Both the profession of warrior and the rights to the land became hereditary, and thus an aristocracy, taking its rise in the same way as that of the Merovingian-Carolingian empire, began to threaten the royal power. Some writers have even ascribed the fall of the empire to this system. A concomitant result of the granting of these rights, which were considered as divinely consecrated, was the great and rapid development of civil law. From 1750 B.C. on the empire began to fall piecemeal under the rulership of alien peoples; from 729 B.C. to 626 B.C. it was under the dominion of the Assyrians and in 539 B.C. was definitively conquered by the Persians and incorporated into their realm.

The Assyrian empire developed to great dimensions by a long series of conquests beginning in the thirteenth century B.C. It represents the most perfect development of the military monarchy in the ancient Near East. The Assyrian emperors ruled their subjugated lands through *shaknu*, or governors. To these governors accrued an extensive power which they often misapplied to their own enrichment. They maintained their own armies, collected taxes and then delivered a part of the taxes to the emperor's court. The army which formed the basis of the Assyrian state was at first enrolled from the entire population. Gradually, however, there developed the practise of commuting the military service into the form of taxes, and foreign troops came to make up the greatest proportion of the army. The native Assyrian population continued to be represented in the government only by an upper class of nobles and officials, and to this condition may be ascribed the inner decay of the Assyrian state which preceded its foreign defeats. In 605 B.C. it was absorbed into the empire of the Medes and in 539 B.C., together with Babylonia, into the Persian Empire.

The Persian Empire, because of its extent and still more because of its fundamental tendency toward conquest and territorial expansion, is the

only one of the despotisms of the Near East that may be regarded as an empire in the narrow and specific sense of the term. Under Cyrus I the Persian state emerged as a union of several tribes and by gradual conquest Asia Minor, Egypt and parts of southern Europe were added to the state. The expedition to Greece represented only a very limited part of the great system of conquests and was but a trifling circumstance in the eyes of the supreme ruler of the Persians. The Persians conducted their wars energetically but without cruelty; nor did they destroy a single center of culture. The Medes, a people of a related stock, shared equal power with the Persians after they were subjugated, while all the other conquered peoples were governed mildly. The combination of local autonomy and a highly developed central authority represents a type of imperial organization hitherto never attained. The empire was looked upon as a unit; its divisions were generally merely administrative and did not follow national lines. A net of powerful governorships headed by imperial satraps was established. Under Darius I (521-486 B.C.) there were twenty such divisions and these were in turn divided into provinces also governed by royal officials. Each satrapy was independent as regards its internal affairs, but written reports were made to the king; a well regulated mail, a system of uniform coinage and the construction of great military roads gave the empire a strong bond of unity. There was no attempt, however, to impose a uniformity of culture and religion. The military system was sound and based on the participation of all the people in time of war. In time of peace a standing army was maintained, built around the 10,000 king's guards, known as the "immortals." In important matters of state the king was obliged to consult with the chiefs of the old noble families. A royal supreme court, whose members were familiar with the old customary law, administered justice and instructed the king in disputes brought before him. While all these factors made for the strength of the empire they also allowed for palace intrigue and dynastic disputes of the most sinister type, which finally undermined it and made it succumb to the personal superiority of Alexander the Great.

These empires of the ancient Near East, comprising the group of fully developed archaic despotisms, are distinguished from the early archaic despotisms of the African Negroes by the greater elaboration of the system of imperial administration and the technical improvement

of the instruments of government. In Persia in particular there also becomes evident the tendency to make the state itself the end of all political action and thought. The Persians were imbued with the desire to subordinate the *οικουμένη*, or the entire group of peoples they knew, to their authority; and, considering their conceptions of the extent of the universe, their ideal of world empire was not far from being realized. These empires of the Near East differ from those of the African Negroes more in the much richer cultural development of the state than in their formal structure. The imperialistic character exhibited externally in political dominion and lordship is evident also in the purely intellectual creations of the peoples of the Near East. In art it assumed the form of a forceful and functional architecture entirely subordinated to stylistic purpose, like the pyramids and columned temples of the Egyptians and the terraced palaces of the Babylonians. In science it appeared as the remarkable monistic philosophy of the Babylonians and in the all embracing and universal character and scope of their metaphysics. In religion, which was related even more closely to their art of government, it was revealed in the creation in the heavenly world of a counterpart of the imperialistic and unifying activities of the kings. The henotheism of the provinces became forged into a polytheistic closed circle of gods. Some of these gods rose to become emperors of this divine kingdom, and in one case the pharaoh, Ikhnaton, desired to consolidate all the cults into an official monotheism of the sun god Aton. This was, however, ultimately overcome by the opposition of the priesthood of the old individual gods.

The Far Eastern empires, although far removed from the Near Eastern group in space and time, are nevertheless closely related to it through their fully developed archaic political structure. China, whose series of dynastic houses is the only one to endure longer than the Egyptian and the beginning of whose chronologically certain history reaches back to about 2200 B.C., is in every respect the most powerful political creation of this group. The preliminary stages to the developed archaic despotism of China are represented by the Mongolian empires of the eastern and western Huns and the khans and their hordes, who overflowed China, western Asia and Europe. They were warrior kingdoms held together by purely personal ties without the firm structure achieved by the settlement of a closely circumscribed territory. Historically

they are noteworthy only because, despite their still crudely archaic form of government, their bands were organized with almost geometrically exact regularity. The followers of Genghis Khan (died 1227 A.D.) were, in accordance with the needs of war, subdivided into divisions of either 10, 100 or 1000 men. Genghis Khan filled his soldiers with the spirit of unconditional discipline. Unable to read or write, he did not wish his people to acquire any culture whatever: they were to remain utterly nomadic and belligerent. This empire, which for a short time extended over three quarters of Asia, fell to pieces after a few decades. The Mongolian empire of Timur (1336-1405), similar to that of Genghis Khan, decayed even more rapidly after the death of its founder.

The middle stage of Mongolian political development is represented by the empire of the Great Mogul of Delhi, reaching its culmination under King Akbar (1556-1605). Akbar was a ruler of tremendous political and military power and he subjugated all of India by a long series of conquests. The fundamental problem of all Indian politics, the conflict between Mohammedanism and ancient Hinduism, was solved for his period of rule; Akbar placed himself above the two faiths, tolerating both and so bringing them to peace.

The Chinese Empire at the time of its greatest expansion about the year 1760 possessed a territory of 13,000,000 square kilometers, almost three times more than the Persian Empire and four times more than the Roman Empire. It numbers today 400,800,000 inhabitants, one quarter of the world's population. The rise of the empire is described in traditional legends. It was probably welded together originally from a number of small states. The king was held to be the source of all wisdom as well as of all power. With the accession of the Chou dynasty in 1122 B.C. a far reaching dissolution of the existing unified empire occurred and the feudal period of Chinese history began. The subsequent course of Chinese history was one of continuous fluctuation between increasing and decreasing imperial power and unity. One of the highest stages of imperial power was that reached by Shih Huang Ti, the Charlemagne of Chinese history, who about 220 B.C. destroyed the feudal system and became the great unifier of China. The empire was divided into provinces assigned in the Carolingian manner to itinerant royal ambassadors. But again, as in the case of Egypt, the governors who replaced the royal ambassa-

dors made their positions hereditary and increased their power at the expense of royal supremacy. In 1368 A.D., under Chu Yuan-chang, the founder of the Ming dynasty, a new high point was established. Many features of the administrative system which he set up were continued until the revolution of 1911-12. Nevertheless, a mild difference between the central power and the provincial administrations persisted, and even since the revolution territorial and perhaps ethnical oppositions have continued. China has exhibited the typical and consistent policy of external expansion and conquest. The almost unappeasable need for expansion was manifested when the army of Ming Ti of the Han dynasty pressed forward as far as the Tarim Basin and when his general Pan Ch'ao conceived the plan of an expedition against the Roman Empire. Under Chu Yuan-chang, Korea, Annam, Burma and distant territories in central Asia were made to acknowledge Chinese sovereignty and embassies were sent as far as Java, Sumatra, Siam, Bengal and Ceylon.

The Japanese Empire was in its earliest period a kinship state with a monarchical head. The Taikwa reforms (645-49 A.D.) initiated the process which fundamentally reorganized the state as a revolution from above transformed Japan into a complete archaic despotism. Like the reforms of 1867, these were inspired by the desire to imitate a foreign model; a commission of Japanese statesmen was sent to China to copy the Chinese institutions. The country was divided into sixty-six provinces, and at the head of each was placed a governor, or *kokushu*, with his deputy, the *suke*, in addition to a staff of officials and scribes. Five inner provinces were isolated as the emperor's seats, or *kinai* (Nara in 710 became the first permanent capital); the others, the outlying provinces, were aggregated into groups (*do*), which did not, however, constitute true administrative unities. Upon this provincial system was built a remarkably organized central administration. At the head of the whole bureaucracy stood the three ministers: the prime minister, the minister of the right and the minister of the left, who were organized as the *san ko*, or ministerial staff. The three *nagon*, the chief, the intermediate and the lesser advisers, who were only slightly subordinate in rank to the *san ko*, constituted with the latter the *Dajo-kwan*, or Great Council of State. The actual central administration was formed of eight *sho*, divisions which consisted in turn of a head and two subordinates of the type of modern

ministers, who directed the affairs of state according to a distinctive departmental functionalization. In addition to this temporal administration, there existed the *Jingi-kwan* for the Shinto cult.

In its economic and social manifestations Japan presents many similarities to the African type of early archaic political organization. All landed property, which after the manner of a kinship state had until then been divided into great sections and along with the slaves made up the common property of the tribes, was now declared to be the property of the ruler. But in this instance a state socialistic system was evolved which was more than mere nationalization of the soil. Every five or six years a new division of the uncultivated lands was carried out. The lands now destined for cultivation were divided into *tan*; that is, rectangular cultivable sections of 1000 square yards in area. To each man a *ku-bun-den*, or portion of two *tan*, and to each woman one of one and a third *tan* was assigned. The head of the family was given the same landholding status as every male and female over five years of age; each was counted as the occupant of an uncultivated section. In addition *ku-bun-den* lands were loaned as rewards for service to officials—permanently, for three generations or for less; *shoku-bun-den*, or service lands, were given to princes and higher officers, and *i-den*, or noble lands, were also distributed. This distribution of uncultivated land to the individual, which is expressive of an almost atomic individualism, born probably out of a sentiment of extreme opposition to tribal collectivism, stands in decided contrast to the foundation laid by the *ko*, or family unit, which otherwise prevailed in the governmental features of the Taikwa reform. Notable also is the fact that the rigidly unified Japan of antiquity did not direct itself externally to a course of expansion or conquest.

The Turks, by far the most talented politically and the most warlike of the Mongols of western Asia, created their empire on practically the same scene as that of the caliphate (*q.v.*) of the Arabs. They were at first dependent on the Seljuks but later spread independently through Asia Minor. In 1356 they crossed the Hellespont, in 1361 they made Adrianople their capital and in 1453 effected the overthrow of the Eastern Empire by their capture of Constantinople. Under Suleiman I (1520-66) they conquered Hungary. During the period of their greatest expansion their empire stretched from the Leitha

to the Bug and the Don, from the Peloponnesus to the Caspian Sea, from Algiers to the Persian border.

The Turkish Empire is the last instance of an empire conquered and ruled in the oriental manner. Its driving force was supplied by the combination of Mohammedan faith, superabundance of will to power and warlike prowess. Measured by the model of archaic despotisms the Turks did not really misgovern their lands. They remained tolerant in the sense that they only wanted to subordinate the non-believers rather than convert them to Islam. Their faults were chiefly those of callousness and, in the worst instances, of extortion and oppression. The administration under Mohammed II (1451-81) was so organized that the head vizier, later called the grand vizier, occupied the highest office and possessed the seal of the sultan, although the sultan was the absolute lord. The provinces were early divided into *sanjaks*, of which under Mohammed II there were thirty-six in Europe and forty in Asia, governed by *sanjakbegs*. The tax, census and postal systems were then already excellently developed. The army was formed of Turks around a nucleus of a lower property owning feudal nobility. The Janizaries, on the other hand, the sultan's bodyguards, were made up of prisoners of war or slaves trained for the service from youth, who devoted themselves unconditionally to the sultan.

The rule of the sultans suffered from the hereditary failings of oriental despotism, palace intrigue and the degeneration of the rulers. After 1566 the encroaching power of the Turks diminished and after 1718 they were pressed back into the Balkans. The nationalist movements of the nineteenth century resulted in the liberation and independence of the Balkan states, and finally by the Treaty of Sèvres in 1920 Turkey lost all its Greek, Armenian and Arabian dependencies. This forcing of the Turks out of Europe was natural and inevitable; it would have come about before the middle of the eighteenth century had it not been for the jealous rivalry of the European powers.

The archaic despotisms of pre-Europeanized America represent another group of empires. The kingdoms of the earlier peoples of ancient Mexico were barbaric incipient forms; the small states of the Mayas of Yucatan were theocracies; but the empire of the Incas in ancient Peru was of higher archaic culture. It too was animated by an incessant drive toward expansion and conquest. Its despotism was similar in many ways

to the near eastern and far eastern forms, especially in its administrative structure, in the division of the people into groups of tens, fifties, hundreds, five hundreds, thousands and ten thousands and in the state socialism of the cultivation of the soil. The name of the Inca empire, *Tahuantinsuyu*, which signifies "land of the four parts of the world," is literally the one assumed by the oldest Babylonian states; and the attempt to impose a state enforced monotheism by one of the last Incas in 1450 A.D. corresponded with the analogous attempt of the pharaoh Amenhotep IV about 1375 B.C. Both emperors assumed the name of the god to be worshiped: the Egyptian called himself Ikhnaton, and the Peruvian named himself Uriacocha after his sun god.

There is no lack of individual deviations and gradations in the morphology of the empires of antiquity, but the outstanding impression despite the variations is one of amazingly monotonous uniformity. It appears as though during this period the great men of action had no other purpose in mind than the concentration of brutal power either over their own people or preferably over alien peoples, and that the peoples themselves acquiesced. The life impulse of this era was tremendous, and since it found an outlet only to a limited degree in intellectual activity it therefore turned toward the simplest, most elementary form of action—violence and exercise of might. All development came merely as a consequence of this deep psychological experience. Another peculiar phenomenon regarding the external fate of nations can be perhaps explained by this experience—the fact that so often the most powerful empires not only decay after a course of centuries but vanish without a trace as though wiped off the earth. This was the fate of the empires of the Egyptians, the Babylonians, the Assyrians, the Medes, the ancient Persians, the Seljuks and the caliphate. Only a few, like the Chinese, Japanese and Turks, survived. It was always an external attack which precipitated the collapse. A new military power came upon the scene, and it was usually the newer nations just emerging from their primitive state who were victorious. The case was also one of geo-historical necessity, since the attacked nations were usually already in possession of rich lands—as on the Nile, the Euphrates and the Tigris—and the attackers came from the bare plateaus or desert wastes.

Little is known concerning the institutions of the empires which emerge in Greek antiquity.

Only the foundation walls of the royal palaces and remains of networks of streets offer certain evidence of the kingdoms of Crete, Mycenae, Tiryns and Troy. These were all states of an extremely limited area, characterized by aristocratic rule and consequently by an encroaching paralyzation or utter annihilation of royal power.

During the later age of Greece, extending from 508 to 404 B.C., Athens experienced a display of political strength in the eras of the Persian and Peloponnesian wars which led internally to an extreme intensification of all its political and military activities and externally to a victorious repulse of foreign attack as well as to an indirect expansion of its own sphere of influence. The intimate naval alliance of Athens with the city-states of the Aegean, which it completely dominated, allows one to speak of an Athenian empire, at least in a figurative sense. The Greeks, however, were never able to achieve union within their own boundaries because of excessive local divisions. For a short time two camps under the leadership of Athens and Sparta confronted each other; but the Peloponnesian War, which arose from this, revealed by its outcome that such opposition was irreconcilable. Agrarian and conservative Sparta although intellectually weaker was victorious but was not strong enough in a political or military sense to subdue thoroughly and permanently the much more versatile Athens. This multiplicity and lack of unity in political life was, however, perhaps the chief cause for the high development of the Greek spirit.

Not until the succeeding period of ancient Greek history was empire created in the modern sense. This did not arise from Hellas itself, which on the contrary lost a large part of its political independence; it was effected rather by the semi-Hellenic Macedonia, which had just emerged from a barbaric, archaic despotism. But the Hellenism arising in this way was impregnated with the Greek spirit and later with Greek blood as well, so that it may be considered the legitimate continuation of the preceding Greek era. Alexander, the creator of a world empire of fabulous proportions in the short period of his life, set his stamp upon an extensive world state from Greece to the borders of India and from Egypt to the Black Sea. To be sure, the structure he built collapsed, but the resultant portions held together in the looser connection of a cultural and land area which may be designated as the first league of states; that is, a number of empires held together by

a durable nexus of political relationships. Thus was formed a confederation of states which while not really comparable in compactness and development with the European alliances of the eighteenth century may be regarded as their germinal and preliminary forms. The internal structure was also rigid and strong: the kingdoms of the Seleucids and the Ptolemies were organized under the influence of the oriental prototypes, the bureaucratic administration in Egypt being improved by its division into several classes and provided with a more highly specialized fiscal department. Material culture flourished under this form of government. The fact that these states broke under the overpowering might of Rome is not to be regarded as a sign of internal weakness.

In Roman history the period of royal control, from 753 to 509 B.C., and the aristocratic period, from 510 to 330 B.C., are occupied almost entirely with factional struggles. The later age from 330 to 133 B.C. is, as among the Athenians, despite its lack of a kingdom a period of development of the severest expression of state power. Internally it led to the concentration and magnification of political and military potentialities; abroad, to the extension of Roman rule in Italy and far beyond its borders and to the repulsion of a terrific foreign assault. The empire arising in this way thus represents the dominion of a single city-state over subjugated but unincorporated and unequal lands.

After a century of revolution, from 133 to 27 B.C., that form of the *imperium* set in which was the first to give to the concept of empire its name and original prototype. At the head there was a monarchy limited by its non-heritability and many aristocratic restrictions but uniting in the hands of the ruler a show of power hardly inferior to that of the ruler of an archaic despotism and after the advances and refinements of a later period even exceeding it in intensity. The might of the ruler, already absolute under the principate, from 27 B.C. to 284 A.D., became quite equal to that of the oriental despotism under the dominate of Diocletian and his successors, from 284 to 474 A.D.: the emperor became *dominus et deus*. The institutions and differentiations of the imperial period, particularly the post-Diocletian, gave rise to a system of officials which in European (but not in Asiatic or American) history has not been surpassed in its multiplicity of divisions. A series of gradations led from the emperor and his *consistorium*, or state council, to the four *praefecti praetorio*,

the administrators of the four large districts of the empire; from the *praefecti* to the *vicarii*, the governors of the next smaller districts still comprising entire countries; and from the latter down to the provincial officers, the *proconsules*, *consulares*, *correctores* and *praesides*. The scheme of organization and the development of law were then of an almost ideal type, and many of its sections remain so today.

In contrast with the modern states the internal structure of the Roman Empire remained basically a city-state as in its early period. Unlike the case of the Asiatic despotisms the peoples of the provinces remained subject peoples. Under Caracalla in 212 A.D. all the citizens of the provinces were granted Roman citizenship just as the people of Italy before them, but the narrow original city unit of the old Roman state with its environs retained the rule in its hands. Thereby through the lack of a strong democratic movement and through the neglect to free the fourth estate of its undeserved shackles of slavery the empire was no longer able to offer resistance and had to succumb to the onslaught of the Teutons, which in itself was the mightiest attack leveled against any cultured peoples in history. More or less by accident the Eastern Empire remained, only to fall prey later, completely disrupted, to the same fate at the hands of the Turks.

The Teutons developed their archaic monarchies out of small, free primitive states. The world empire of Charlemagne soon overshadowed them all and absorbed a great number of them within its sphere. The essence of the developing European political world lay in the basic fact that for the first and only time in history an entire group of states existed side by side without being bound closely either in peace or in war. In internal structure these states resemble in many aspects the archaic despotisms of Asia and even Africa, such as that of the Babylonians and the Hova of Madagascar. They share in common also the pressure toward conquest and expansion: the empire of Charlemagne has been estimated, probably too highly, as having contained 20,000,000 people. The Frankish administration by duchies like that of most of the Teuton kingdoms was made up of only one class but was at its height firm and reliable.

The road to the Middle Ages leads from the hereditary succession of officials and fiefs to the aristocratic state and the diminution of the royal power and with it the stability of empire. Never-

theless, the ancient imperial tradition continued to be a force in this period of the history of Germany; in England and France the counter-movement for the resurrection of royal power began its course early. The claim of the German kings to Italy, Rome and the accompanying title of Roman emperor was a survival of the Carolingian era and became ineffectual after the extinction of the house of Hohenstaufen.

The modern age, like the Greek and the Roman, was a period of the most powerful external expansion and internal concentration of the power of the state. This was true also of those states like Venice and Holland which had no monarchical form of government. The characteristic traits of international history of this age were the consolidation of the mediaeval groups of states into a society of states, the extraordinary increase of both military and peaceful relations within this society of states and finally the expansion of leading states by the conquest of non-European colonies, as in the cases of Portugal, Spain, Holland, France and finally but most successfully England (*see* COLONIES).

The most recent period is distinguished by imperialism (*q.v.*), which begins with the truly personal type of Napoleon and his attempt to set up a world empire. After the collapse of this undertaking the liberal democratic movement extending over a century introduced a pause in imperialism. The attempt of Napoleon III to create a European republic of states was only a weak reverberation. In the last third of the nineteenth century, however, imperialism as a collective movement arose and resulted in the creation of the great colonial empires of Great Britain, Russia and the United States.

The extension of the European society of nations to a circle of world states must be regarded as a corollary of imperialism. As early as the sixteenth century the Germanic-Roman concert of states had been widened by the addition of the still mediaeval Poland and in the eighteenth century by that of archaic and despotic Russia into a German-Roman-Slavic group of states. The American Revolution brought the United States into this group. As a result of the World War the League of Nations was brought into being, and as a consequence the ideal of world unity has been still more widened to embrace many of the non-European states.

Contemporary imperialism is simply the most modern form of that primitive drive for power which has led kings and nations onward ever since the pharaohs upon the path of acquisition

of ever increasing masses of territory and of political power. The countermovement, which has called pacifism into being as its theoretical manifestation and the League of Nations as the much more powerful practical form of repression and limitation of the primitive human urge, is today neither morally nor politically in the ascendancy.

EMPLOYEE REPRESENTATION. *See* INDUSTRIAL DEMOCRACY.

EMPLOYEE STOCK OWNERSHIP. In the third quarter of the nineteenth century profit sharing acquired considerable importance as a method of stimulating increased labor efficiency and developing more harmonious relations between employer and employees. Some employers in England and the United States adopted the policy of distributing either optionally or arbitrarily the employees' share of profits in the form of company stock. Employee stock ownership thus grew out of profit sharing. Later employees were invited to buy stock in their companies and the terms of buying were made easy.

In the United States before 1900 several railroads tried to interest their employees in buying stock; but only one, the Illinois Central in 1893, attained a measure of success. Several companies that had profit sharing schemes allowed their employees to take their profits in the form of stock. Following the lead of other industrial companies the United States Steel Corporation made an offer of shares in 1903, starting an annual series of offerings since unbroken except in one year. Before the World War and during the war and its early aftermath others of the largest companies of the country adopted employee stock ownership plans; the largest of all, the American Telephone and Telegraph Company, did so during the depression of 1921. The movement was greatly accelerated in the epoch of recovery and boom that lasted into 1929. Probably three quarters of all companies that offered stock began to do so between 1916 and 1928.

The largest corporations, those with from 10,000 to 100,000 or more employees, have long been leaders of the movement. No count of the companies participating has pretended to be complete, but the number is probably nearer 1000 than 500. In 1927 it was estimated that the movement had embraced 1,000,000 employees, whose shares were worth \$1,000,000,000. In England in the same year there were 503,400 stockholders in eighteen corporations capitalized at \$700,000,000, many of them employee stockholders; in the case of Brunner, Mond and

Company employees owned 643,000 shares, or 5 percent of the total. Employee stockholdings are concentrated among a minority of employees and corporations; in 1927 in the United States 269,239 employee stockholders in thirteen corporations owned \$425,000,000, or almost half of all employee stockholdings. In 1929 a well marked era came to an end; the promotion of new plans declined, many companies withheld further offers or abandoned them altogether, and the stock owned by employees shrank severely in the general decline of market values.

Although employee stock ownership grew out of profit sharing and purchase plans often incorporate features suggestive of it, a distinction is imperative. Profit sharing arises most readily in a country where productive enterprises are small and owned by few persons and where the employees' wages or salaries may be supplemented in cash with a portion of profits that would otherwise accrue to the owners. Where the owners of capital are more numerous and where ownership takes the form of shares of stock, the employees may acquire shares. If a profit sharing plan is already in force, employees may receive shares in lieu of cash; copartnership, as this system is called in England, would then result; in that country it has latterly gained in prominence over long established profit sharing. In the United States both profit sharing and copartnership have greatly lost ground in comparison with stock purchases for cash, which in England would be called contributory copartnership. Copartnership in England is more highly developed than ordinary employee stock ownership; but the latter in recent years has acquired considerable importance, particularly among the larger corporations.

It is plain that stock purchase plans can arise only in a country where the rate of wages and the usual steadiness of employment allow employees to accumulate a surplus over customary needs. They thrive in a country where the stock market has been broadly advertised. In the United States their greatest development came after Liberty Loan campaigns had disclosed unsuspected founts of popular saving. The employee who had paid for his war bonds with periodical deductions from his earnings was ready to pay for shares of stock in the same way. After the war also customer ownership campaigns flourished whereby public utility corporations sought new capital and larger public confidence by selling shares to customers; the operation was conducted with a publicity that

stimulated the movement for stock purchase by employees.

Businesses, such as metal mining, whose profits fluctuate sharply from year to year rarely offer shares. Businesses whose earnings are steady or rising or which have a reserve of financial strength to withstand fluctuations of earnings have been leaders; the example of one company in an industry has been quickly followed by others. The more successful manufacturing companies, many electric light and power companies, the important petroleum refiners, a number of railroads, large mercantile enterprises including some chain systems, and sundry large banks have offered stock purchase plans to their employees.

The advantages intended are mutual. The employee is assisted to share in the prosperity of the company and makes a desirable investment of his savings. In turn he is expected to work more steadily, less wastefully, with more devotion to the company's interest; to become more constructive in his criticism and a force for allaying grievances instead of magnifying them.

In most of the companies trade unions have never been a significant factor and their introduction has been consistently opposed by the managements. Many companies have been leaders in the introduction of various policies calculated to improve labor relations within the company; in this respect employee stock ownership is an aspect of the "welfare capitalism" which has made rapid strides in recent years.

Either all employees or only stated groups may be eligible to subscribe. If the price is low or the incidental advantages of subscription are great, eligibility may be confined to workers employed for from two to five years or to managers and supervisors who are able to make the work of those below them more effective. The American Tobacco Company, which for years had maintained a plan open to the rank and file, established one in 1930 for several hundred employees, "beginning with the President and going down to and including sub-assistants in factory departments," to whom it offered a varying number of shares at a low price as "additional compensation for services to be rendered." In so extreme an instance the offer is tantamount to a bonus. Sometimes a company begins with an offer to "key" men and gradually broadens it to include nearly all employees; it is usually in manufacturing companies that "key" men are given preference. The higher executives

and the directors may be expressly excluded; occasionally a stock purchase offer is made exclusively for the higher executives. In general, employee stockholders and holdings are concentrated among employees in sales, technical, managerial, supervisory and other executive positions—among those, in other words, who are capable of influencing increased output and business.

The number of shares obtainable is usually determined by the amount of the employee's annual earnings. In the American Telephone and Telegraph Company it is one share for each \$300 of annual remuneration, with fifty shares as a maximum; in the United States Steel Corporation it is one share for \$1400 of compensation and more shares, rising to a maximum of sixteen, for fifteen higher salary groups. The price is sometimes the market price but is commonly less, even much less; alternatively, the company may "contribute" a portion, say a third, of the purchase price; and sometimes it binds itself to pay an annual bonus above dividends on shares that are retained.

Where a stock is intended primarily for persons in authority, most of those eligible are likely to buy. Where it is open to all, the proportion reached will depend on the effort made to enrol all, particularly since the price may be less advantageous where the scope is comprehensive. In many companies a comparatively large number of employees have subscribed; the range is from 5 percent to 40 percent, with an average of probably 15 percent for all the companies affected. A majority of employees is rarely included; even in the case of some small corporations, where employees own from 25 percent to almost 100 percent of the stock, employee stockholders do not exceed 40 percent of the total number of employees.

The variety of plans is great. Nearly always there are special features of price and term of payment, sometimes provision for loans on the stock to employees who need them or bonuses for retention of stock. Occasionally the stock is a preferred stock, more rarely a special form of employee stock; usually it carries a vote and in exceptional cases, for example, the Reynolds Tobacco Company, almost the entire voting stock may be lodged with executives and other employees. Sometimes, as in several Standard Oil companies, trustees vote the stock while it is being paid for. A number of plans are worked in close conjunction with employee representation schemes and company unions.

Employees often sold their shares when the market price rose. This was observed thirty years ago after the early Illinois Central offers and has been noted repeatedly since. Hence there are restrictions on selling, usually indirect: in many plans, a disqualification from buying more shares at a low price in the subsequent offering of stock. Yet often no penalty is attached if the employee retains a substantial part, say half, of his shares. Upon withdrawal from employment the employee who has not completed payments on stock may receive his money back with interest or its equivalent in stock.

In a few small companies groups of employees have become the owners of a large majority of the outstanding shares, although this is rare. In three of the largest corporations of the country, Swift and Company, the American Telephone and Telegraph Company and the United States Steel Corporation, employee stockholders owned as early as 1926 about an eighth of the stock; in two leading Standard Oil companies they owned 4 percent, having become the second largest stockholding interest. In other representative corporations, however, employee ownership was much smaller—0.4 percent, for example, in General Motors and 0.7 percent in the Pennsylvania Railroad. The average in the thirteen largest corporations was 4 percent; in twenty representative corporations the employee stockholders owned 4.5 percent of the aggregate stock. (Of the \$92,000,000,000 stock of all corporations, the total employee holdings of \$1,000,000,000 constituted not much over 1 percent.) The combined strength in voting control of employee stockholders never equals that of a single stockholder owning the same fraction of stock, because they are scattered and may prefer or may chance not to vote together. In a few corporations either meetings of employee stockholders are held or they are permitted to elect a member of the board of directors, but this development is apparently not encouraged by the managements; in fact, in one extreme case the corporation explicitly denies its employee stockholders the right to vote, become members of the board, inspect the books or in any manner participate in management or control. Whatever its potentialities, the influence of employee stockholders on management and control is inconsiderable, although the final verdict must await developments still to come.

The influence of the employee stockholder in matters that concern him as employee is probably greater than his holdings would suggest

Employee Stock Ownership—Employers' Associations 509

Where the invitation to buy is repeated in later years, other evidences of good will are likely to appear—the more, if the company notes evidences of increased loyalty on the employee's part, diminished turnover of labor, avoidance of waste and the like.

The long market decline beginning in 1929 produced considerable losses among employee stockholders, although losses in many cases were mitigated by the fact that shares had been bought at the low prices of several years before or at least at prices below the highest boom prices. At the end of 1930, 320,000 American Telephone and Telegraph employees were still making payments on stock that would cost them \$240,000,000, at a price per share of not over \$150, a price well below the market at that time. This is the more favorable side of the picture. The shares of many companies fell, however, to a level far below the price the employees had paid, followed by reduction or omission of dividends; employee stockholders forced to sell because of unemployment or other reasons had to take heavy losses.

Opinions about the employee stock ownership movement differ. What established corporations have fostered has commended itself to the conservative both in business and outside. Critics who fear a growing concentration of control under capitalism have welcomed the employee contingent to the swelling ranks of stockholders of the large corporations. Those who emphasize the thrift of the individual as a means to his own improvement and to the healthy advance of society have commended the new movement. Enthusiasts have seen the foreshadowing of industrial democracy; it is interesting to note that one of the earliest of these enthusiasts, Nicholas Paine Gilman, said in 1889 that employee stock ownership "tends to make the establishment a purely co-operative one in time." This view has been ridiculed by the leaders of organized labor, who discern in the development an attempt to forestall a virile trade union movement. At the 1926 convention of the American Federation of Labor the Executive Committee in its report called employee stock ownership "a supplementary method of retarding the legitimate trade union movement" but urged further study and "utmost discriminating care" in passing judgment on particular stock purchase plans, as there were cases where plans were not used to combat unionism and collective bargaining. A resolution in that sense was adopted by the convention. The more radical labor elements consider em-

ployee stock ownership one of the newer devices of capitalism to strengthen its power.

EMPLOYERS' ASSOCIATIONS. An employers' association is a group which is composed of or fostered and controlled by employers and seeks to promote the employers' interests in labor matters. It is therefore, on first view, to the employer what the trade union is to the employee. The highly formal superorganization of employers of modern times has been the result of the capitalistic evolution in industry, commerce and finance. This evolution has also made trade union organizations both complex and extensive, and accordingly the associations and the trade unions have had counteracting influences on each other. This counteraction, the heart of the modern labor problem, has not been parallel, however, and associations are not the exact counterparts of unions either in form or activities. Action and counteraction have resulted in the more efficient organization of employers to meet uninterruptedly and effectively the chronic problems arising out of the employment relation. Whatever socializing influences have developed have been incidental and subordinate to that purpose.

Employers' associations are not a new form of organization. A stone tablet which has been unearthed among the ruins of ancient Sardis shows not only that employers' associations existed in the building trades of that day but that they appealed to governmental authorities to restrain certain practises by the workmen. The craft guild

of the Middle Ages ordinarily functioned as an employers' association not wholly unlike associations of master craftsmen in the building trades of our own times. In the United States the craft guild functioned as an employer's association in the colonies of Massachusetts, New York and Pennsylvania. Thus an association was formed to resist the demands of the ship carpenter sailors. The early conspiracy cases against labor organizations were instituted by the associations of master cordwainers, master carpenters, master tailors, master hatters and so on. The early associations employed methods suggestive of current practises; welfare work was promoted by the Employers' Central Executive Council shortly after its formation in 1873. As early as 1880 a National Labor League was formed in Pittsburgh for the purpose of building up workmen's organizations "to put an end to strikes," and employers were also advised to use the labor injunction.

The assumption that trade union organization has always preceded any organization by employers is unwarranted. Employers' associations are organized and function whenever a group of employers is convinced of the desirability of united action in dealing with labor questions. For instance, the desire for legislation which would fix wages and require seven-year apprenticeships, as subsequently enacted in colonial Massachusetts, may have been the primary motive for the formation of the master shoemakers in 1646. European craft guilds had long furnished abundant precedents for such legislation. More recently the opposition to labor laws led American employers in the textile industry of the South to organize, although their employees were wholly unorganized. In Japan, where the workers are practically unorganized, the employers have strong associations. It is true, however, that demands from a newly organized or rejuvenated union may cause employers to reorganize, especially to organize more formally than in the past.

An employers' association differs from other entrepreneurial organizations such as chambers of commerce, trade associations, exchanges and pools, which are organized to promote a different set of interests. Since in the United States, however, the line of functional demarcation is not always clear, an employers' association rarely remains simply pure and usually performs other functions incidentally. On the other hand, a chamber of commerce or any of the other commercial organizations may also function as an

employers' association; it usually limits its activities to propaganda for the employers' point of view, but in local affairs it may occasionally act as a local coordinating employers' association. The chambers of commerce of France claim the right to control apprenticeship and other methods of training industrial workers, but the semipublic nature of the French chambers gives them a vastly different status from those in America.

At times an employers' association whose jurisdiction is limited to a handicraft trade, as, for instance, an organization of master plumbers, is called a trade association. Generally, however, a trade association has a larger scope, and where it concerns itself exclusively with the growth of the trade or commerce of its members and does not deal with labor matters it is not an employers' association. Even such an organization may take on the character of an employers' association—if, for instance, in attempting to improve the technical methods and equipment used in production by its members it should take up the matter of labor efficiency. A manufacturers' association which generally functions as an employers' association in such fields as legislation, politics and propaganda may be termed a trade association although its membership and purpose may be industrial rather than primarily commercial.

Similarly, pools and other price fixing associations may at times function as employers' associations, especially when the labor cost constitutes a large proportion of the cost of production, as in the anthracite coal and iron and steel industries during the last quarter of the nineteenth century and in the building and photo-engraving industries today. A unified financial organization, however, like the United States Steel Corporation, cannot properly be called an employers' association, although many of its subsidiaries may belong to the employers' association in their respective fields. In addition to these easily recognized groups there are in the United States such bodies as citizens' alliances, leagues for industrial rights, rotary associations and the like, which may closely resemble the employers' association or may take on some of its functions.

There are many types and classifications of employers' associations. They may be classed according to jurisdiction as trade, industry and general associations. They may be formal or informal, depending upon whether the organization has a constitution, rules and a definite pro-

cedure; the formal are usually incorporated. Geographically, associations are local, state, district, national and even international. With regard to formal relations with other associations they may be classed as unaffiliated, affiliated and federated; federations may be pure or mixed and centralized or decentralized.

The different types of association make the movement seem more confusing and inconsistent than it really is in purpose and operation. In the United States, where the association develops out of immediate problems and has no official status, although its representatives may in practice exercise great influence, there arises the greatest number of types. In Italy the chief employers' association, especially since its acquisition of a legal status in 1926, functions as a great central controlling body that fosters and modifies its affiliated organizations in accordance with one general plan. Between these two extremes are the great majority of the continental European associations which, especially since the World War, have a quasi-public status and are represented on the national and local councils of labor and industry set up for advisory or other purposes by the governments. The best examples of this type are probably the German associations.

In contrast with most European associations, except those in France, the associations in the United States are not closely knit into federations, since they depend usually upon informal interrelations. Where federations do exist in the United States their decisions commonly have no binding effect upon the affiliated bodies, whereas in Europe the general federations in varying ranges of degree exercise considerable control. Although within national limits there are associations that are exceptions to the rule, the percentage of employers belonging to associations is generally greater in Europe than in the United States. In Italy membership has reached the highest attainable point, since by the law of 1926 the so-called independent employer is required to pay dues and is bound by the action of the association just as though he had joined voluntarily. In fact, employers' associations function as part of the government and constitute an essential factor in the Fascist regime. The law requires collective agreements and prohibits strikes and lockouts as criminal offenses. Over three million industrials are included within the jurisdiction of the Fascist Confederation.

On the basis of their attitude toward trade unions, associations may be classed as negotia-

tory, entering into trade agreements, or belligerent, offensively or defensively opposing union activities. A third and minor type is the mediatory association of which in the United States the National Civic Federation is an example; its aim is to induce employers and employers' associations to negotiate with trade unions. This classification also determines function and activities; from a functional point of view associations may be unrestricted or special; they may engage in propaganda, legislation, politics, welfare work, mediation, negotiation, conferences or in limited combinations of these. Thus the negotiatory association directs much of its energies into conferences with trade union officials, in formulating trade agreements and in adjusting disputes that arise between its members and their unionized employees. Negotiatory associations may also combine with trade unions to fix prices or control working conditions and in functioning thus may promote extensive "rack-teering." In case of a strike resulting from failure to adjust differences directly or through arbitration the formerly negotiatory association may take on many of the functions of a belligerent association.

The belligerent association may perform any or all of the following functions: It may combat strikes with the old methods or with a modern highly organized and efficient system. It may prosecute union leaders for the violation of injunctions it has instituted, also for boycotting and the like. It may oppose legislation sought by the unions and seek to counteract their political activities. It may conduct propaganda against unionism generally and union leaders specifically. It may make direct war upon the union label and the closed shop in every conceivable manner. It may foster rival independent employee or company unions to supplant or weaken trade unions. During strikes it may assist its members financially; in the United States reserve funds of the association are drawn upon for strike breaking expenses; the European associations, generally negotiatory, provide usually against industrial war periods by schemes of strike insurance. It may eliminate and keep unionists and agitators out of the association shops by means of employment bureaus, independent ("yellow dog") contracts with employees and intelligence corps (labor "spies"). It may suggest to the employer that employee stock ownership in his corporation would lessen agitation. It may promote welfare work. It may encourage and support numerous forms of in-

dustrial education with a view to training an adequate supply of non-union workmen. It may urge employers to instal new machines and processes in their shops, thus depriving the union members of the strategic position that trade secrets and skill otherwise give; this procedure has proved to be a most effective weapon against trade unionism.

In general the aim of all employers' associations is to preserve the institution of private property and to maintain conditions least likely to diminish the profits of the employer and his control over his business. Thus the negotiatory Building Trades Employers' Association of New York City sets forth as its purpose: "In all lawful ways to promote and protect the business interests of the members of the Association." The hierarchy of the Italian employers' associations, at the head of which is the General Fascist Confederation of Italian Industry, officially explains its existence as "in accord with the general Fascist conception of production, in which all idea of the class struggle is abolished and all the various factors of production, actuated by a common spirit of collaboration, are required to adjust their mutual relations by agreement." The trade agreement thus becomes a weapon against the class struggle. The mediatory National Civic Federation in the United States also "aims to bring together the three forces of capital, labor and the general public to work out industrial problems through evolutionary rather than revolutionary processes." With the aid of trade unionists it seeks to make effective assaults upon the socialist movements. On the other hand, the belligerent National Erectors' Association, also in the United States, declares that "Bolshevism and the I. W. W. are being held up as bogies from which the acceptance of closed shop unionism is alleged to be the only escape"; and the Metal Trades Association, which is the largest, most highly developed and efficient belligerent association of the unrestricted type, places itself on record as in "opposition to the attempts of labor unions to fasten upon the industries of this country uneconomic conditions."

Perhaps the most outstanding difference between European and American national organizations is that the latter are predominantly belligerent, while except in France and Finland the great national associations of Europe, which developed out of belligerent organizations, are now usually negotiatory. In the United States the great majority of trade agreements entered

into by negotiatory associations are local—as a result not so much of the process of decentralization as of the transformation of national negotiatory associations into belligerent ones—but in Europe national associations for the purpose of conference with trade unions have extended beyond trade lines. Thus, for instance, in the National Alliance of Employers and Employed in England, a joint organization of trade unions and employers' associations, the following employers' associations are enrolled: Federation of British Industries, National Federation of Iron and Steel Manufacturers, Brass Founders' Employers' Association, Associated Chambers of Commerce, Incorporated Federated Association of Boot and Shoe Manufacturers, Central Landowners' Association and local associations. In Germany in 1924 the joint industrial association which was made up of representatives of associations and trade unions who had jointly signed the "November agreement" was broken up with the abrogation of that agreement. The associations in Germany have generally remained negotiatory, but the agreements have been decentralized to trade, industry or district. A similar decentralization also took place in Denmark about the same time. The approval by the federation is, however, usually a requisite to the validity of the localized agreements. In Italy this is true without exception. In France collective bargaining by the associations is confined mainly to the printing trades.

European employers now generally accept formal group action even in legislative matters, while perhaps the great majority of employers in the United States believe that individual or informal group action is preferable. Negotiatory associations must necessarily enrol most of the would be competitors in order to function best. On the other hand, a high degree of organization of employers is most difficult in the highly competitive industries. Organization of employers over the competitive area is often indirectly encouraged for negotiatory purposes by trade unions. The belligerent employers' association is designed primarily to preserve the individualism of the employer in labor matters, and the enrolment of competitors is not so necessary to its success. A careful reading of the declaration of principles of the National Association of Manufacturers or of the National Metal Trades Association will show that they are concerned mainly with the rights of the employer to conduct his employment relations free from "outside interference."

Associations in Europe have attempted far more than those in the United States to enrol the small employer. In the United States therefore the average number of employees per member is much higher. Small manufacturers have been organized in separate associations abroad, notably in France, Rumania and Denmark. Probably one of the most active associations of this type has been the federation of small manufacturers in the boot and shoe industry of France. France especially has developed associations of small employers because of the great extent of small scale enterprise there. In Denmark the small employers and their associations were brought into the general federation, but due to the post-war depression concessions to them in the matter of dues were necessary to prevent wholesale withdrawals. This resulted in the discontinuance of strike insurance by the Danish Employers' Federation and the adoption of reserve fund levies with very much restricted payments for strike relief. In these levies also special concessions to the small employers were made so that they paid proportionately less than other employers. The Swedish Employers' Federation has also had difficulty in retaining its small employer members. In contrast the belligerent Central Association of Finnish Employers eliminated the small employer by restricting membership to employers who used ten or more workers.

Whereas associations in Great Britain and Ireland, Germany, Italy, Denmark, Norway and Sweden include practically all the employers in the country and can thus commit the whole body of employers in any locality, trade or industry and even the entire nation to a particular course, almost the opposite is true in the United States. Here associations in very few trades, industries or even localities can boast of a membership of more than 80 percent of all eligible employers. Even the National Association of Manufacturers, the largest organization of its kind in the world, has enrolled only 5000 members, a very small percentage of the manufacturers of the United States. As a rule associations are more highly developed in the iron and steel industry than in any other industry, and the United States and Germany probably lead in the extent of association in this industry. Nevertheless, in the United States there are large numbers of employers in the metal trades whom even the National Metal Trades Association, one of the most efficient associations, has not desired or been able to enrol as members.

The organization of agricultural employers' associations is more fully developed in Germany than elsewhere. France has some agricultural employers' associations, mainly in the wine growing sections. The difference in the methods of landholding in the two countries is one of the chief factors in the comparative development. Italy's agricultural employers are also organized under government jurisdiction. Except among the fruit growers in California agricultural employers' associations in the United States are few and poorly developed.

Within a country there are frequently wide divergences in practise among the various associations. For instance, in Great Britain while the Engineering and National Employers' Federation was declaring a lockout in 1922 with the new issue of managerial functions as the point in dispute, the National Federation of Building Trades Employers of Great Britain and Ireland was taking a strong stand over apprenticeship, an issue that disappeared long ago in machine industries. Again, the Flour Milling Federation of Great Britain adjusted wages on the cost of living index basis, although the Glasgow Chamber of Commerce condemned the system.

Employers' associations expand most rapidly in membership and power during war years and years of credit expansion; this expansion goes unnoticed, however, until it is demonstrated in the strike waves which follow these periods.

Nearly all the great central federations of continental Europe and the United States have been formed in the twentieth century, most of them during or following the World War. They were logically succeeded by the growth of international employers' associations, also a post-war development. International cooperation existed prior to 1900, especially among the belligerent associations. In recent years, however, especially in industries whose products compete internationally, negotiatory associations have co-operated or federated internationally, primarily because concessions in increased wages or reduced hours made by an association in one country are likely to place its members at a disadvantage in international competition. This form of international association may have some bearing on the fact that in Great Britain in 1924 wages in industries competing on the world market were only 30 to 40 percent higher than in 1914 while in other industries they were 100 percent higher. International legislation on hours has stimulated the growth of such international employers' associations as the Inter

national Association of Building and Contracting Industry and the International Federation of Master Cotton Spinners and Manufacturers. In 1922 international cooperation among agricultural employers and their associations in Belgium, Czechoslovakia, Denmark, France, Great Britain, Italy, the Netherlands, Norway and Sweden resulted in the International Association of Agricultural Employers.

Associations have fostered the growth of welfare work and engaged extensively in industrial betterment activities. In this respect they have aided in the improvement of working and living conditions among the laboring classes. Perhaps no associations have undertaken to promote welfare work more systematically than those in Italy, yet conditions in Italy are not regarded as approaching the ideal. Belligerent associations like the National Metal Trades Association in the United States and negotiatory associations like the United States Brewers' Association have promoted welfare work but for different ends. Associations in France, Germany, Austria and Belgium have favored family allowance schemes but on a voluntary rather than compulsory state basis. Some European associations have endorsed hour legislation as a general principle, but they have protested against a rigid fixing of hours for all industries without regard to particular conditions and against subjecting the industries of their own country to an eight-hour convention when other competing countries were not so restricted by law. Employers' associations have advocated workmen's compensation laws and other legislation promoting the safety and health of workmen, but in these matters the broad social point of view has not been foremost. While the welfare work of associations has in one sense seemed to have a great socializing influence upon the individualism of the employer its main purpose has rather been the opposite, to offset in the United States the betterment activities of trade unions and in Europe the propaganda of socialistic organizations. In other words, welfare work serves the purpose of retaining for the employer the greatest amount of control possible over his business.

EMPLOYERS' LIABILITY. Prior to the adoption of the modern systems of workmen's compensation for industrial accidents the opportunity of an injured workman to obtain damages from his employer rested in western countries upon the law of negligence. Fundamental to recovery was the necessity of showing in the courts that the injury to the servant was due to the master's negligence or fault. The general principle of the common law was that an injured person could recover for a tortious act in a suit for damages against the person guilty of the tort. A corollary of this principle was that the responsibility for an injury done to a third person because of the negligence of a servant working under the master's direction rested upon the master himself. It was and still is as-

sumed that in such cases the servant is an agent of the master and that the latter must bear the burden of the servant's negligence.

If these principles had been followed consistently, an injured servant could have recovered damages for an accident occurring in the course of employment by demonstrating the negligence of the master himself or of another servant. In 1837, however, in the English case of *Priestly v. Fowler* (3 M. & W. 1) Lord Abinger laid down the precedent that a master was not responsible for injury due to the negligence of a fellow servant. In that case a worker riding on a van was injured as a result of the breakdown of the van due to its careless overloading by a co-worker. Lord Abinger pointed out that the servant was under no obligation to take the risk, since he was free to decline employment, and that he was just as likely to be acquainted with any danger which existed because of his fellow's negligence as was his master. Thus was first enunciated the famous fellow servant doctrine, also known as the doctrine of common employment, which was thereafter generally followed in England and the United States. In 1842 the doctrine received its classical American statement from Chief Justice Shaw of Massachusetts in the case of *Farwell v. Boston and Worcester Railroad* (4 Metcalf 49).

In its most extensive form the fellow servant doctrine operated to relieve the employer of responsibility even though the fellow servant whose negligence resulted in an injury was a superior officer under whom the injured employee worked or was engaged in a department of the establishment other than that of the injured worker. All persons employed by a common master, whether or not they ever came into personal contact with each other or were in a position to exercise a restraining influence upon each other, were regarded as fellow servants for whose negligence the employer was not held responsible. Moreover, the employer was further protected by the doctrine of contributory negligence. If he could prove that the injured employee had failed to use reasonable care in doing his work and that the accident was due even though only in part to the worker's own negligence, the latter could not recover damages from his employer. A third defense of employers was involved in the doctrine of assumption of risk, according to which a worker on taking a job assumed the risk of injury due to ordinary dangers inherent in the occupation. It was maintained by the courts that the ordinary risk of

accident was considered when employer and worker made the wage contract and that the employer therefore had no pecuniary responsibility in case of accident arising from such a danger. This rule was also assumed to follow from the theory that an employer was responsible only for an injury due to his own negligence. The courts were not disposed to consider him negligent if accidents occurred, providing he had taken reasonable precautions to prevent them.

The positive duties of the employer to prevent accidents were to employ a sufficient number of competent servants, to put proper rules into effect whenever such rules might be expected to reduce the possibility of accidents, to provide a reasonably safe place to work and to furnish safe tools and machinery. The courts in considering whether the employer had met these obligations set up so-called reasonable standards of performance and did not hold the employer to uncommonly high requirements. If despite these ordinary precautions of the employer a worker was injured, the court generally absolved the former from responsibility for damages on the ground that the worker had assumed the risks of such injuries on accepting employment. If a worker knew that his work was especially dangerous because of the failure of the employer to perform all his duties and nevertheless continued to work without notifying the employer of the existence of the hazard, the latter could not be held responsible in case an accident resulted. If, on the other hand, the employer was notified and had promised to repair the defect and an accident occurred before the promise was fulfilled, responsibility rested upon the employer. If after a reasonable time the employer's promise had not been fulfilled and the worker continued to work, the responsibility for an accident reverted to him.

During the latter half of the nineteenth century the law of employers' liability, as here described, was generally applied in Great Britain and the United States. On the continent of Europe the provisions of the civil law of liability, based upon the individualistic conceptions of the Roman law, resulted in the development of a law of employers' liability similar in many respects to that in Anglo-Saxon countries but on the whole somewhat more favorable to the worker. In France the law was based upon articles 1382 to 1384 of the *Code civil*. The first two of these sections provided for fault liability. The third stipulated more particularly that

masters and employers were responsible for the injury caused by their servants and overseers in the performance of the functions in which they had been employed. These provisions were interpreted to mean that every person must answer for an injury to another due to the negligence of himself or his agent. Thus workers could recover if they could prove that either the employer or his agent was responsible for the accident. On the other hand, workers could not recover for injuries due to the ordinary risks of work nor could they recover for accidents due to their own negligence. A doctrine of contributory negligence, however, was not rigorously applied, such negligence going ordinarily only to the measure of damages. The law in Belgium, Spain, Italy, Switzerland and Holland, based upon the same articles of the *Code civil*, was similar to that in France. It should be noted that the law of employers' liability based upon these provisions differed in an important respect from the common law in England and the United States: the fellow servant doctrine was not applied. In Prussia, on the other hand, the fellow servant doctrine was generally applied; under the rules of the German common law an employer was responsible only for the results of his own personal negligence; this meant that he was responsible only in so far as he had chosen incompetent agents.

The operation of the law of employers' liability worked an especial hardship upon the injured employee and his dependents. In a period during which industrial organization grew in size and complexity, widening the gap between worker and employer, and the widespread use of dangerous machinery and complicated industrial processes intensified the hazards of employment the worker encountered in the courts a set of principles which were much better suited to an industrial society characterized by the use of easily controlled techniques and by an intimate relationship between the master and his worker. The employee, badly in need of financial help because of the costs of the injury and interference with his regular income, was compelled to bring an expensive suit in the courts on his own initiative, based upon provisions of law unsuitable to the protection of his interests.

Moreover, in the case of fatal accidents a rule existed in the common law which was generally without a counterpart in the law of continental countries, existing neither under the French civil code, the German pandects nor the Prussian or Austrian codes. This was the rule that in case

of wrongful death no cause of action survived to the dependents or next of kin of the deceased. Based upon the maxim *actio personalis moritur cum persona*, the Latinity of which has been considered by legal historians to be very dubious, the rule operated entirely to relieve an employer precisely when an accident proved most serious. It was abolished in England, however, at a comparatively early date by Lord Campbell's Fatal Accidents Act [9 and 10 Vict. c. 93 (1846)], and a movement for similar legislation began about the same time in the United States, resulting finally in the adoption of one form or another of remedial statutes in all American states.

The social inadequacies of the whole situation with respect to employers' liability gave rise to the passage of statutes whose purpose was to limit the application of the employers' ordinary defenses. Probably the first of such statutes was the Prussian law of 1838, which declared that a railway company was responsible to any person for an accident unless it could be proved that the accident was due to the injured employee's own negligence or to *vis major*, the equivalent of the common law "act of God." This statute put into effect a principle which was far in advance of its time, i.e. under it the burden of proof in case of railway accidents to workers rested upon the employer. Other German states copied the idea, as did Austria in 1869, and in 1871 it was enacted into an imperial statute which was extended in 1873 to the whole empire. The first section of this act relating to railways simply incorporated the provisions of the Prussian law of 1838; the second section of the act applied to accidents in mines, quarries and factories and while it established less favorable rules of liability in these fields it represented some improvement over the German common law. It was provided that in case of accidents in mines, quarries and factories the employers were to be liable for the negligence of the officials (or vice principals) whom they had put in charge of their establishments. This involved an important modification of the fellow servant doctrine which bore a close resemblance to provisions of later English and American statutes.

The English Employers' Liability Act of 1880 had as its chief object the abolition of the fellow servant defense in the case of accidents due to the negligence of a vice principal; and in the case of railway accidents due to the negligence of a person in charge of the operation of signals, locomotives or trains. The provision respecting railway accidents was later embodied in the

statutes of Massachusetts, New York, New Jersey and other states, although it is to be noted that Georgia had adopted a similar provision as early as 1855 and several other American states had followed it. A number of states, including Massachusetts, New York, New Jersey and Pennsylvania, enacted statutes abrogating the fellow servant doctrine in the case of injuries due to the negligence of a superior employee with authority to give orders; while other states abolished the doctrine when the fellow servant was engaged in a different department of the establishment. The doctrine was abolished in case of railway accidents in about two fifths of the states and in case of mine accidents in Missouri and Oklahoma, and it was abrogated as a defense in all accident cases in California and Colorado. In some jurisdictions the courts themselves modified the fellow servant doctrine without waiting for the passage of legislation. Thus the rule was not applied with respect to vice principals by the United States Supreme Court; with respect to superior servants by the courts of Ohio, Illinois and a number of other states; and with respect to workers in other departments in Illinois, Missouri and elsewhere.

The doctrine of contributory negligence was also modified by statute. In its place was set up the rule of comparative negligence, according to which proof of the worker's own negligence instead of completely relieving the employer of responsibility operated to diminish his responsibility in proportion to the relative negligence of the worker. This principle was embodied in the legislation of California, Wisconsin, Georgia and Oregon and was applied to railroad accidents in Nebraska. In several jurisdictions the doctrine of assumption of risk was abrogated by statute in case of injuries arising through the violation of safety laws by the employers. California in 1911 abolished the doctrine of assumption of risk in all cases.

The Federal Employers' Liability Act of 1908 as amended in 1910 applies to accidents upon railways engaged in interstate commerce and represents a serious attempt to correct the inadequacies of the common law. This legislation followed an earlier act of 1906 which had been held unconstitutional upon the technical ground that it applied to intrastate as well as interstate commerce [Employers' Liability Cases, 207 U. S. 463 (1908)]. The legislation now in force has completely abrogated the fellow servant rule. It has substituted the principle of comparative negligence for that of contributory negligence.

It has abolished the doctrine of assumption of risk in all cases in which injury was due to the violation of the safety statutes by the railway companies. It has provided for damage suits in case of injuries resulting in death. Finally, by declaring void any contract between the employer and the worker whereby the latter agreed not to bring suit in case of injury it has met a situation under which workers were often seriously handicapped.

Despite attempts to improve conditions by legislation of the kind described the shortcomings of the law of employers' liability had become so generally recognized toward the end of the century that there was widespread dissatisfaction with it among employers and judges as well as among workers. It was recognized that only a small proportion of injured workmen received substantial compensation and that they and their dependents were forced to accept lower living standards and often suffered destitution as a result; that even in those cases in which substantial damages were awarded the recipients had to pay excessively large fees to attorneys, estimated at from 20 to 50 percent of the awards; that the system by encouraging fruitless litigation was expensive to the state; that recovery under it was long delayed, although the need for funds on the part of the injured was immediate; and that it bred antagonism between employers and workers, since whenever accidents occurred the opposition between the two parties was likely to be intensified.

Although injured workers did not often win substantial awards in the courts, juries occasionally granted large sums. Employers found it difficult to plan for such eventualities. In time private insurance companies came to their aid and offered in return for the payment of regular premiums to assume the burden of fighting liability cases and to pay within stated limits whatever damages were awarded. Many employers took advantage of this opportunity, but since it was generally impossible to estimate the probable cost of the burden to the insurance companies with any degree of accuracy the premiums were very high. As a result employers were generally found to be paying sums to the companies greatly in excess of the amounts actually paid out by the latter to injured workers.

Furthermore, the employers' liability system operated to promote dishonesty and legal malpractise. The victim of an industrial accident was likely to be interviewed at the first opportunity by a lawyer offering to defend him and

urging him to bring suit for a large sum or by a lawyer for the employer or an insurance company urging him to make an immediate and inadequate settlement and stressing the weakness of his legal position if he should bring suit. In either event a just settlement was not likely to result. The situation encouraged the presentation of perjured testimony if the case went to court, and the superior legal talent representing the employer reduced the worker's already slight chance of victory. If the worker under the pressure of need agreed to a cash settlement instead of bringing suit, he was unlikely to get substantial compensation.

The need of an entirely different compensation system for injured workers was recognized earlier in Europe than in the United States. The first step in reform was the acceptance of the principle of *risque professionnel*. Instead of relieving the employer of responsibility for accidents due to the ordinary hazards of industry it was proposed that the costs of such accidents as well as of all others except those due to the worker's intention should be considered as part of the costs of production and should therefore be borne by the industry. Accompanying the principle of *risque professionnel* was the idea that compensation for injuries should be paid without the necessity of bringing suit and according to a definite schedule of benefits varying with the nature of the injury. The third and final part of the new system was compulsory insurance carried by employers to enable them to pay compensation to injured workers.

Workmen's compensation laws embodying these principles more or less completely had been enacted in all important European countries by 1910, at which time a campaign for their adoption was well under way in the United States. The pioneer country in Europe was Germany, which adopted a workmen's compensation law in 1884. It was followed by Austria in 1887, Norway in 1894, England in 1897, France and Italy in 1898, Spain in 1900, Holland and Sweden in 1901, Belgium and Russia in 1903, Hungary in 1907 and Switzerland in 1911. The first compensation law in the United States was passed by Maryland in 1902 but was declared unconstitutional two years later. This, however, was only a temporary setback. At the end of the year 1930 only four states were still operating under the law of employers' liability.

EMPLOYMENT EXCHANGES

EUROPE. Employment exchanges are offices at which work people seeking employment and employers requiring work people may notify their respective needs. They are a market place for labor, intended to replace the unguided individual search for work or for employees—the hawking of their labor from door to door by work people, the posting of their needs at their own factories by employers or the use of newspaper advertisements by either. The general function of employment exchanges is thus to substitute an organized for an unorganized marketing of labor, but where such employment exchanges are run as competitive business enterprises this function is likely to be subordinated to that of profit making for the owner of the exchange. There has therefore been advocated and in some instances effected the establishment of a coordinated system of public employment exchanges. The main advantage to be gained from organization is greater and better guided mobility of labor from district to district and trade to trade carrying with it an improvement of industrial efficiency and a reduction of unemployment. Public employment exchanges have also been advocated for a number of subsidiary purposes including the decasualization of occupations which make a practise of casual employment, such as dock labor, the dovetailing of seasonal occupations and vocational guidance to juvenile

workers; these are all specialized forms of labor market organization. In addition the employment exchange may supply information as to unemployment to serve as a basis of relief measures and may control the administration of unemployment insurance.

The organization of employment exchanges as a gratuitous social service under public control is now part of the industrial policy of most European states and of many states outside Europe. At the first session of the International Labour Conference of the League of Nations held at Washington in 1919 a convention as to unemployment was signed, including as its second article a provision that each ratifying member was to establish a system of free public employment agencies under the control of a central authority, with advisory committees representative of employers and of workers, and that where both public and private free employment agencies existed steps be taken to coordinate their operations on a national scale. It provided moreover for a coordination of the operations of the various national systems by the International Labour Office in agreement with the countries concerned.

By the end of 1928 twenty-three countries had ratified the conventions unconditionally; namely, South Africa, Austria, Bulgaria, Denmark, Estonia, Finland, France, Germany, Great Britain, Greece, Hungary, India, Irish Free State, Italy, Japan, Yugoslavia, Luxemburg, Norway, Poland, Rumania, Spain, Sweden, Switzerland. An additional number of countries have more or less developed systems of free public employment exchanges: Argentina, Australia (where exchanges are maintained by the separate states), Belgium, Canada, Czechoslovakia and the Netherlands. The actual scope of the exchange system varies greatly in the different countries. In Russia the system is coordinated with the scheme of state socialism and use of the exchanges is compulsory upon all employers wishing to hire labor. The most highly developed voluntary systems are those of Germany and Great Britain.

In France a system of public employment exchanges has been in existence only since the war of 1914-18. Although regulatory legislation dates back as far as 1852 and acts passed in 1904 and 1910 provided for the setting up of employment exchanges by the cities, it was not until after the legislation of March, 1916, that the system became effective. Departmental (provincial) exchanges replaced those of the communities and were coordinated into a national system through

six regional clearing houses and a central employment exchange under the Ministry of Labor. In 1929 the total number of placings made by these offices amounted to over a million and a half; most of the offices are highly sectionalized as to vocations and each industrial section pursues a policy which has been arrived at after consultation with representative bodies of workers and employers. In addition to these exchanges there are depots in border cities which recruit and place several hundred thousand immigrant laborers annually.

In Germany the employment exchange system is local in origin. The Berlin exchange was founded by a voluntary association as long ago as 1883. A general movement for the establishment of exchanges in all important towns either directly under the municipal authority or with a subsidy from its funds began about ten years later as a consequence of the industrial depression of 1893-94 and the attention called thereby to the problem of unemployment. By 1904 there were about 400 public general exchanges filling about 550,000 vacancies a year in addition to exchanges maintained by employers, trade unions, guilds, chambers of agriculture and other bodies. A survey of the exchanges was made at that time by the German Statistical Office as part of a report on the possibility and methods of insuring against unemployment, since it was believed that the practicability of unemployment insurance depended entirely upon an adequate system of employment exchanges.

Until after the World War the national government in Germany merely collected information and published statistics as to the work of the local exchanges. A movement toward nationalizing the system began as part of demobilization plans in December, 1918, and culminated in the act of July 16, 1927, setting up a National Institute for Labor Exchanges and Unemployment Insurance (*Reichsanstalt für Arbeitsvermittlung und Arbeitslosenversicherung*). This institute, although its headquarters are in the Ministry of Labor at Berlin, is not technically a department of the federal government and its officers are not federal civil servants. It is intended to be a self-governing institution for a specific public purpose, under the control of a commission representing equally employers, employees and public authorities, with the president of the institute as its chairman. Most of the exchanges formerly maintained by local authorities have been incorporated in the institute as distinct employment offices; of these there were 361 in op-

eration in 1928. In the same year there were moreover 1629 non-profit making exchanges maintained by public and philanthropic bodies; these although not incorporated in the institute are to some extent supervised and coordinated by it. There were also many registries—principally for domestic servants—run as commercial undertakings. The act of 1927 provided for the abolition of all such profit making registries by December 31, 1930. The employment offices directly controlled by the institute filled 6,258,373 vacancies in 1929, while the independent exchanges not working for profit filled 756,425 vacancies. In addition to exchange work in the narrow sense the institute has an elaborate organization for giving advice to boys and girls in the choice of careers. It also, as its name indicates, administers the compulsory unemployment insurance system.

In Great Britain effective employment exchanges developed much later than in Germany and were national almost from their beginning. Before 1910 the only exchanges of any importance were those established by the Central (Unemployed) Body for London under the Unemployed Workmen Act of 1905. The national system followed on the report of a royal commission which from 1906 to 1908 exhaustively examined the administration of the poor laws and the problem of unemployment and recommended as the first step for dealing with unemployment the establishment of a national system of labor exchanges. Under an act passed in pursuance of this recommendation in 1909 a system of exchanges covering the whole United Kingdom was established, controlled by a government department, the Board of Trade. The first exchanges began work in February, 1910, and the system reached its full extension by the beginning of 1913; to it was added the function of administering the system of compulsory insurance against unemployment, introduced for certain trades under part II of the National Insurance Act of 1911. The exchanges were at first known as labor exchanges; the name was changed to employment exchanges at the end of 1916. Almost immediately after, on the institution at the beginning of 1917 of a separate Ministry of Labour, control of the joint service of the employment exchanges and unemployment insurance was transferred from the boards of trade to this new department.

The system today includes about 1200 local offices. Of these slightly over 400 are employment exchanges staffed by full time officers in

the direct service of the Ministry of Labour, covering all towns and urban districts of any importance; while about 800 are branch offices in small towns and country districts, undertaking specified duties in connection with exchange work and insurance for a remuneration varying with the volume of work. All these local offices are grouped in seven territorial divisions in each of which is a divisional clearing house charged with the duty of coordinating the work of the separate exchanges. The endeavor of each exchange is to fill any vacancy for employment from suitable men on its register; if suitable men are not available, the vacancy is transmitted to the divisional clearing house; the divisional clearing houses in turn communicate unsatisfied demands for labor to a national clearing house. The exchanges deal with all kinds of employment—manual, clerical, domestic—and make no charge for their services. As in Germany, the private registry for domestic workers still predominates, especially since workers in private household employment are exempted from unemployment insurance. In the case of a trade dispute the exchanges do not refuse to register vacancies created by it but in bringing these vacancies to the attention of work people give notice of the dispute. With juvenile workers under eighteen special consideration is given to vocational guidance either directly by the Ministry of Labour with the help of a special committee representative of educational interests or else by the local education authority, which maintains an exchange for juveniles under the supervision of the Ministry of Labour and in cooperation with the rest of the exchanges. It is estimated that these agencies handle rather more than half of the total number of juvenile workers.

The development of the British employment exchanges as placing agencies has been much interfered with, first by the war of 1914-18, during which a great variety of miscellaneous duties was thrown upon them, and later by the growing burden of insurance administration. In 1928 a government committee called the Industrial Transference Board drew attention to the importance of transferring to other areas men in districts where mining and certain heavy trades had irretrievably decayed. Partly as a result of this and partly for other reasons there has been within the past few years a revival of exchange work proper, as distinct from unemployment insurance, in the employment exchanges. The number of vacancies filled each day, which had sunk to under 2500 in 1922, rose

to over 5000 in 1929 and rose still further in 1930 in spite of the severe depression of trade. The scale of operations of the British exchanges as placing agencies is thus much below that of the German exchanges but appears to be greater than that of any other country except Russia, where it is recorded that an average of 2,500,000 vacancies is filled each year.

W. H. BEVERIDGE

UNITED STATES. The private fee charging employment agency is as characteristic of the United States as the socialized service is of European countries. The public employment agencies of municipalities, states and the federal government numbered about 217 in 1930. There is no accurate record of the number of private agencies, but it is estimated that there are between 3000 and 5000, operating under highly varying state regulatory provisions. This figure probably includes a number of agencies operated on a semicommercial or non-profit seeking basis for the placement of social workers as well as juvenile vocational guidance bureaus, private teachers' agencies, collegiate women's vocational bureaus and the like, which represent the most efficient and most reputable of the group.

The large majority of the employment agencies are those which supply manual labor and domestic service. The most powerful are those which supply railways and contractors with common labor. They are strong business organizations with central offices in such labor centers as New York, St. Paul, Minneapolis, Chicago and St. Louis and branch offices or representatives in a number of other cities. Their contracts with the railway provide for their exclusive employment not only as recruiters and suppliers of labor but as concessionaires and owners of the commissaries operated along the line. These agencies usually split fees with "padrones" among the immigrant groups, and the workers are often bled by these padrones for additional fees, representing interpreters' commissions for securing jobs or preventing discharge. Since this is predominantly an interstate business, it is impossible for the individual states to regulate the agencies adequately and no federal provision has as yet been enacted.

State regulation varies widely in effectiveness. The first regulatory act was that of Massachusetts in 1848. In addition to Wisconsin, Minnesota with its act of 1885, which established a \$100 municipal license fee and required the posting of a \$10,000 bond to be drawn against

for damages in case of fraud, and with subsequent legislation is at present the only state with stringent regulatory legislation. Idaho is the only state which prohibits fee charging agencies. An attempt to pass a similar law in the state of Washington was declared unconstitutional [*Adams v. Tanner*, 244 U. S. 590 (1917)]. Forty-one other states have enacted legislation, with licensing fees ranging from \$2 to \$200, the majority being between \$10 and \$100.

The provisions of the regulatory laws indicate the abuses which characterize the business. They prohibit misleading advertising, misrepresentation and other forms of fraud. They forbid agencies to collect fees from both employer and employee and prohibit fee splitting between the agencies and employers. Some states endeavor to regulate the fees to be charged. Oregon, for instance, has graduated fees approximating 5 percent of the wages paid on the job. Most states forbid registration fees. Some require the filing of fee schedules with the industrial commission. A number of states require the agencies to post notices of strikes and lockouts or to stamp the information on the introduction cards given to men sent out to jobs where disputes are in progress.

A judicial decision which may be of far reaching importance in such regulatory legislation is that reached in *Ribnik v. McBride* [277 U. S. 350 (1928)] which held unconstitutional a New Jersey law fixing the fees charged by private agencies on the ground that such legislation exceeded the police power of the state. This is especially significant in view of the impotence of the public employment exchange, the movement for which has been greatly hampered by the activities of private employment agencies.

Isolated attempts on the part of states to establish public offices date back to 1890, when Ohio established agencies in five cities. In the quarter of a century preceding the depression of 1907 only twenty-seven such agencies had been established, but between 1907 and 1909 twenty were instituted. The return of prosperity caused a loss of interest in the agencies and in 1917 there existed only ninety-six in the entire country.

Federal activity in the establishment of public employment offices actually began in 1913 with the creation of the Department of Labor; under an empowering act of 1907 its Bureau of Immigration and Naturalization opened a number of offices in eighteen "zones" throughout the country, each manned by an immigration inspector and some with branch offices. The number of

offices opened had no relation to the employment needs of the states; their methods of operation, such as the posting of notices in public places, violated most of the canons of good employment practise. A similarly inadequate step was next undertaken, when every post office was made an employment office.

Whereas prior to the World War the establishment of public offices was urged as a measure of unemployment relief during periods of depression, labor shortage constituted the basis for the wartime public employment system. Already in 1914-15 the labor surpluses on which employers depended showed signs of decreasing and with American participation in the war employers feared the loss of millions of experienced workers. In the first few months of American participation not only employers but government departments stole men from each other; private agencies and their scouts reaped enormous profits; turnover increased by leaps and bounds. On January 3, 1918, therefore the Employment Service was separated from the Bureau of Immigration. The United States Employment Service, which was created to replace it, had to function immediately although it had neither organization, equipment nor staff. The service expanded by the rapid establishment of new offices, reaching a total of 832 by October, 1918, and by the absorption of existing state and municipal offices, either by agreements or cooperation or by assuming actual control. Strenuous efforts were made to enlist other agencies: third and fourth class postmasters, the newspapers of the country, motion pictures, the National Grange and other agricultural organizations, councils of defense and the like were utilized. Cooperation was also effected with the United States Department of Agriculture. The recruiting of labor was aided by two organizations previously created: the United States Public Service Reserve and the Boys' Working Reserve. It was not until President Wilson declared that after August, 1918, all employers "engaged wholly or partly in war work, whose maximum force . . . exceeds 100" were required to hire all of their unskilled labor through the United States Employment Service that employers began seriously to depend upon the service and to discontinue competitive solicitation. About the same time state advisory boards, community labor boards and the like, on which employers and employees were represented, were established. There were 1386 such organizations in operation by October, 1918.

By the time the organization was in good working order the armistice had been signed. In 1918 the service was financed from the president's contingent fund by an appropriation of \$5,500,000. In 1919 Congress appropriated \$400,000 for the service but subsequently cut the appropriation to \$200,000. The agitation of the National Manufacturers' Association, which feared a possible labor bias in the service and preferred an uncontrolled labor surplus, and of private agencies as well as the inefficiency and waste of the service during the war militated against the continuance of the system.

Intermittent efforts to reestablish an adequate federal-state employment service reached a high point in the depression of 1929-31. The Kenyon-Nolan Bill, later known as the Wagner Bill, providing for a supervisory organization on a nation wide basis with financial aid to and control over state and local exchanges, was presented to Congress several times and was finally passed in the spring of 1931 only to be vetoed by President Hoover.

ENCLOSURES. Enclosure was the process by which, from the twelfth century onward, land hitherto unoccupied or subject to common control or rights passed into individual use and enjoyment. Its outward sign was a ditch, wall, fence or hedge; its motto, "Trespassers will be prosecuted." In the New World enclosure accompanied the growing density of settlement and the framing of satisfactory methods of alienating the public domain; inroads on native land (as in New Zealand), boundary disputes with neighbors, pastoral leasehold tenures (as in Australia), the desire to prevent cattle from straying, the scarcity of shepherd labor and the cheapness of steel wire led to the rapid enclosure of arable or pastoral holdings in most newly settled regions. In Europe also enclosure brought much waste or unoccupied land into effective use, but more conspicuous is the fact that it did much to destroy the village community, redraw the rural map and clear the way for better husbandry. It was a powerful force in transforming the British manorial system into the modern capitalistic rural organization and in building up the latifundia of Hungary, of Germany east of the Elbe and of Spain; and within the past fifty years it has been invoked to free Russian and Prussian peasants from the routine and conservatism of village control.

The central feature of the economy within which the European enclosure movement developed was the mediaeval village, with its open arable fields cut up into many strips, its common pasture and waste lands, its two or three-field system including fallow, its predominant subsistence farming and its rule of custom or communal decree. In such a village the typical cultivator held a number of strips of arable, received a share of the hay from the village meadow and had the right of pasturing his plow oxen and some other animals on the commons, on the waste, on the meadow after hay had been cut and on the arable fields after harvest or during the period of fallow. Other common rights gave him access to supplies of fuel and lumber and possibly of fish. The humbler villagers, who had little or no arable land, were able to feed a few sheep and cattle on the commons, thus supplementing their earnings as hired laborers or as village industrialists.

The possible defects of this system are obvious in retrospect. There was waste of land, as in balks, headlands, paths, and waste of time in getting from strip to strip or from the dwelling to the more distant lands; plots were too small or narrow for efficient cultivation; drainage and weed control were difficult; distant fields received little manure; boundary disputes and trespass were common; soil exhaustion was possible and land was put to uses for which it was unfitted. Commons might be overcrowded, cattle diseases could spread easily, breeding was promiscuous, cattle strayed and waste lands were underutilized. Routine imposed by the village checked initiative and experimentation and accentuated rural conservatism, although incidentally it may also have checked the slipshod farmer. But these criticisms are in large measure the verdict of hindsight; they are valid only in the light of a knowledge of better technique, of transportation facilities, of supplies of capital, of commercial rather than subsistence farming, of the existence of good urban or foreign markets, of growing population, of land scarcity, of the possibilities of specialized production and of a class of landlords or cultivators actively seeking to wring a larger financial return from the soil. The persistent survival of the open field system in at least half of England until the eighteenth century and in parts of the continent until recent decades is evidence that it did manage somehow to satisfy the economic and social needs of a peasantry which was chiefly concerned with feeding itself and paying its dues, had little contact with big growing markets, had little capital and was resigned to occasional starvation. Only the pressure and possibilities of the last two centuries have revealed fully the unsuitability of the system and have led to its final disappearance in England; on the continent its end has not yet come.

Enclosure as it was commonly practised might be of at least four kinds. The most simple form was the enclosure of waste lands—moors, sandy stretches and swamps—over which villagers might have common rights, but from which the landlord drew little benefit. Such land was of little use until it was enclosed and treated systematically by drainage, paring, manuring and similar methods. Secondly, common pastures might be partially enclosed by the commoners or under certain conditions by the landlord. In a third form of enclosure the demesne arable strips were withdrawn from the village fields, consolidated and enclosed in a compact

farm. Meanwhile other arable holders might by exchange, purchase, lease or other means bring their scattered strips together, and this procedure if pushed far enough would convert the open fields into enclosed compact blocks of land. As a fourth method all the village lands might be enclosed at one step instead of piecemeal. In such case the claimants surrendered all their rights to arable, to a share of the hay and to common pasture. In return each received one piece of land, on which he could do as he wished and from which he must draw crops, hay and fodder. The transformation would be completed if the farmer built a house on his new holding and migrated from his home in the village.

Enclosure was continuous, especially in England, from at least the thirteenth century; therefore the methods as well as the character of the land enclosed changed with altering economic and political conditions as well as with the status of the enclosers. Some enclosure, possibly piecemeal, was done by the cultivators themselves even in fourteenth century England. One instance of such enclosure by agreement in 1250 has been found, and it is certain that during later centuries agreements among farmers led to consolidation of arable strips or enclosure of commons. In peasant countries, such as France after the revolution or Russia after the emancipation of the serfs, agreements played the chief part in the process of enclosure; in Russia after 1906 the state allowed the individual to demand the withdrawal of his holding from the village fields and permitted a bare majority of the mir to decide that the whole of the land be cut up into individual farms. But important as was this movement the initiative, especially in England, was taken chiefly by the landlord.

The enclosing landlord had some freedom of action. He could withdraw the demesne from the village fields. As tenancies fell vacant he might add them to the demesne, and tenancies at will could be terminated at any time. The Statute of Merton (1235) and the Statute of Westminster II (1285) conferred or confirmed power to enclose parts of the common pasture or waste provided sufficient land was left to satisfy the tenants' common rights, and in this way the landlord could add to the demesne or carve out new tenancies. In Germany the introduction of Roman law after 1500 gave the landlord legal sanction to enclose commons, for the Roman code did not recognize common rights. But any further action was checked by property

rights which had to be respected, namely, those of the glebe, the tithe owner, freeholders, copyholders and tenants for life, lives or long leases. The landlord might buy up these rights, especially those of the freeholders; he might wait till tenancies expired, try to convert copyholds into leaseholds and leaseholds for lives into shorter tenures; he might try to expel tenants or take advantage of real or technical defaults to seize holdings; he might impose so heavy a fine when a holding passed from the hands of one generation to those of another that the newcomer could not pay it and had to surrender. He might seek agreement among the owners of these rights and have it confirmed by a decree in chancery or an engrossment in quarter sessions. Finally, after 1688 he could appeal to Parliament for a private enclosure act which would impose on recalcitrants an agreement reached by the owners of three fourths or four fifths of the "rights, shares, and interests"; and as he by this time owned possibly at least half of them, it was not difficult to get the tithe owner and a few others to join hands in a petition to Parliament.

The prominent part played by the landlord class in the English movement may be explained partly by the extent to which that class was refreshed by constant infusions of capital and blood from the commercial and financial groups. The social prestige and later the political power attached to landownership attracted the bourgeoisie; except in times of rural depression land has seemed a good investment and the mortgage a gilt edged security. London merchants of the fourteenth and fifteenth centuries bought land for social advancement or for investment of their idle capital. Land held by the old feudal families or the monasteries passed largely into the hands of men drawn from the city, and the opportunities for feeding towns and of meeting the demand for wool had given a commercial flavor to rural life by Tudor times. The rising prices of the sixteenth century tempted owners to get the most out of their estates, and leasemongers rented lands in order to sublet them at a profit; the sequestration of royalist estates after the civil war and the land hunger of the industrial and commercial leaders in the eighteenth century brought new brooms to sweep the countryside. Finally, the profitable possibilities of high farming were seen first by the landed class and led it to enclosure as a preface to the investment of large sums of capital on improvements and the reorganization of estates in larger farms.

The attitude of the state toward enclosure has

been determined by consideration of social as well as economic results and partly by the relations between landlord and state. The Tudors tried to check enclosure of arable and commons for grazing purposes, since this caused rural depopulation, weakened the country's man power and accentuated pauperism. In Denmark landlords were forbidden in 1682 to absorb serfs' holdings into their demesnes lest the supply of militiamen be reduced. Prussian and Austrian rulers tried to protect the peasants in the eighteenth century for similar reasons. On the other hand, a government controlled by landowners would permit and even encourage enclosure. English landlords dominated Parliament, which in turn dominated the government after 1688; and the path to enclosure was smoothed. In Prussia the *Junkers* were strong enough to be able to frame the details of the emancipation decrees in such a way that the peasant lost a third or a half of his land. In Estonia and Livonia the large landowners could do as they wished, and when the serf gained freedom he paid for it by losing his holding.

Governments also favored enclosure when some urgent need had to be met or where it was evident that the open field system was standing in the path of agricultural progress. Bad seasons, rising prices, the demands of growing industries and population and the threat of starvation during the wars from 1793 to 1815 would have driven any kind of British government to foster enclosure after 1760. The French royal decrees of 1760, 1764 and 1766, encouraging reclamation, division of commons and limitation of common rights, were prompted by English example and the desire to end the famines which so frequently gripped France. The Danish government in 1781-82 realized that the open field plan barred agricultural improvement and therefore gave peasants power to withdraw their holdings. Forty years later Prussia led the German states in authorizing the division of village lands and reformed the laws of inheritance to prevent further subdivision of small properties into still more strips and still smaller estates. Austria on the eve of the World War was vigorously encouraging the consolidation of peasant holdings, and Stolypin's Russian reforms of 1906 were an attack on the conservatism and inefficiency that came from village control and dispersed holdings. Since 1918 countries attempting land reform have given attention to consolidation of arable strips (e.g. Czecho-

slovakia and Poland) or to the dissolution of the mires (Latvia and Lithuania).

We cannot measure accurately the extent of enclosure in any country at any period. Analysis of the data bearing on the Tudor enclosures has toned down the exaggerated pictures painted by contemporaries and shown that the area and population affected at that time were fairly small. But the material is far from complete; it deals with the great central plain and leaves the southeast and southwest shrouded in mystery. Similarly, we do not know exactly how much land was affected by the thousands of enclosure acts passed after 1700 and know nothing about the area enclosed by other methods. Before 1700 about half the parishes in England had open fields; there was still a vast area of waste land, estimated by Gregory King at 10,000,000 acres. After 1700, 4800 acts and awards authorized the enclosure of an area which has been estimated at 6,500,000 acres, or nearly one fifth of the whole country. In fourteen counties between a quarter and a half of the land was enclosed by legislative sanction alone. In Prussia between 1870 and 1911 nearly 50,000,000 acres, owned by 2,500,000 peasants, were recast in solid holdings; this was an area equal to about two thirds of the total cultivated area of the German Empire. In Russia the Stolypin reforms led between 1907 and 1916 to the enclosure of 10.9 percent of the holdings and 10.7 percent of the area held in village allotments. In Lithuania 1510 villages with a common ownership were reorganized up to January 1, 1928, and Latvia is steadily proceeding with the liquidation of 3600 village communities taken over from Russia.

The economic effects of enclosure were generally beneficial. Enclosure in itself did nothing to improve farming methods, and many eighteenth century observers were surprised to find old rotations and fallows on enclosed land. It did, however, liberate for productive use much land which had been wasted in balks, footpaths and the like; it saved the cultivator's time by concentrating his work in one place, stopped trespass and ended boundary disputes. Its chief merit lay in what it permitted rather than in what it did; it gave the individual cultivator freedom of action and opportunity to practise better farming. Drainage, cross cultivation, root crops, new rotations, better manuring, substitutes for fallow, all could now receive attention. Light soils yielded more abundantly when turnips or clover replaced fallow; meadows and pastures could be nourished; cattle breeding

need no longer be haphazard; abundant fodder was forthcoming for larger herds, which in turn meant more manure and better crops; while land could be put to the use for which nature or the market made it most fitted. Waste lands could be made more productive and swamps and sand hills be systematically treated. There was inducement to landlord or cultivator to sink capital in improvements or equipment; and rising productivity, especially if accompanied by rising prices (e.g. in England between 1760 and 1814 and from 1849 to 1873), allowed rent and profit to be increased. Sir William Beveridge estimates that since the Middle Ages there has been at least a threefold increase in English wheat productivity. The credit for this cannot be apportioned among the various factors responsible, but there is probably a measure of truth in the various eighteenth century assertions that enclosed land yielded about 25 bushels per acre while adjacent open land gave 15 to 17 bushels. Perhaps the best measure of enclosure and its sequel, better farming, is seen in the United Kingdom's ability to feed a population which grew from 15,000,000 in 1801 to 21,000,000 in 1821 and to supply nine tenths of the wheat requirements of 27,000,000 people in 1841.

On the continent too enclosure gave the farmer freedom to discontinue fallowing and to develop rotations based on alternation of cultivated grasses and cereals; it made possible the improvement of livestock and of dairying, the cultivation of the potato and beet and the building up of larger grain exports from the lands south of the Baltic. Where holdings were small, consolidation of strips or plots allowed the peasant to make the most of the little he had.

Of the effects of enclosure on rural society it is less easy to make generalizations. Where arable was converted to pasture and tenants' holdings or commons were swallowed up in sheepwalks, there were depopulation, eviction and possible destitution. In Tudor England and in Scotland two centuries later there was much suffering, but in the eighteenth and nineteenth centuries the dispossessed could migrate to the growing industrial towns or emigrate. Enclosure after 1760, and especially between 1793 and 1815, was carried on under the shadow of bad seasons and rising prices, the promise of the new agricultural technique and the worship of the large farm. Hence the chief sufferers were the small leaseholder and the cottager who supplemented his wages by keeping livestock on the commons. Tenancies at will could be termi-

nated at any time, and all leases except those for life or lives were voided by an enclosure act. The small leaseholder was squeezed out in order to make possible the creation of larger tenancies. Cottage tenants received no land in lieu of common rights, for the land went to the owner of the cottage; cottage owners did get some, but it was usually too small to be of much use and often money compensation was paid instead. Thus the small lessee became a wage earner and the poor lost room for their livestock. There is general agreement between contemporaries (such as Young) and modern scholars that the divorce of these classes from the soil was, as Curtler says, "the great blot on the enclosure movement" and that the injury was indisputably great. On the continent the loss of "servitudes" (i.e. the small peasant and laborer's right to use the forests and pasture lands) cut away an important source of supplementary income; in post-war Poland, for instance, the breaking up of the large estates has deprived the laborer of employment, while the distribution of the commons has taken away his "servitudes."

Enclosure helped to build up larger holdings, especially where the demand for grain, wool or high farming was urgent. The small leaseholder's land went to make larger units in eighteenth century England; the holdings of Prussian peasants were absorbed in the large grain farms of the *Junkers* after 1807; and many small or less successful owners in Russia sold their lands to others after 1906, thus helping to swell the *kulak* class. By the eighteenth century most of the unenclosed land in England was being cultivated by tenants who held at will or on short leases, and the landlord was therefore free to redivide most of his land in such units as he wished. But Professor Clapham's analysis of census returns destroys the old view that enclosure put an army of laborers under a small group of big farmers. In 1831 it was estimated that 47 per cent of the British farmers employed no hired labor or omitted to mention any; in 1851 the percentage was 45; and two thirds of the farms in that year were less than 100 acres in area.

It is hard to disentangle the effect of enclosure from that of purchases and price fluctuations on landownership. The growth of trade in land, the extension of leasehold at the expense of copyhold, the ban on entail from the fifteenth to the seventeenth century and the political and religious disturbances combined in England to cause mixed movement, in which some large estates and many small ones disappeared but in

which apparently the moderate sized owners increased in number. After 1660 and especially after 1688 there was marked diminution in the number of small and medium owners and a growth of large estates. A recent survey of 2000 parishes in eight counties which were the scene of much enclosure during the eighteenth and nineteenth centuries shows that in 1780-86, 90 percent of the land was in the hands of tenants at will or on short leases and that occupying owners (including freeholders, copyholders and tenants for life or lives) had ceased to be an important feature of rural life. During the years 1780 to 1815 parliamentary enclosure gave full weight to the claims of these owners, and they received compact farms. Some of them, however, could not bear the cost of enclosure and sold out; others sold their land in order to lease larger farms or to get capital for investment in industry or commerce. The rest flourished, thanks to war prices, while many successful tenants bought land, thus adding to the number of farming owners. The depression and lower prices after 1815, plus the burdens of taxation and poor rates, ruined many of these men; yet the number of occupying owners in the eight counties examined was larger in 1832 than it had been in 1780, and during the intervening years no large new estates had been formed at the expense of such owners. We have therefore to look to other forces than enclosure for an explanation of the decline in the area cultivated by owners in England; it fell from at least 15 or 20 percent of the country in 1830 to 10.7 percent in 1913. This was partly due to the landlord's inability to sell in bad times because of entail and his willingness to buy more land in good times. He bought extensively during the prosperous period that began in 1837 and culminated in the early seventies; thus he reached the peak of a development which had been going on by fits and starts for at least five centuries and which made general that distinctively British system in which the big landlord supplied land and fixed improvements, the tenant farmer supplied management and working capital and a landless class supplied the hired labor.

ENCYCLOPÉDISTES were the group of scholars, men of letters and *philosophes* who under the direction of Diderot and d'Alembert collaborated in the great *Encyclopédie ou dictionnaire raisonné des sciences, des arts et des métiers* of the French Enlightenment. The *Encyclopédie* was originally designed as a commercial enterprise in the form of a translation of Chambers' *Cyclopaedia or an Universal Dictionary of Arts and Sciences*, which had been published in London in

1728. In 1746 after divers fruitless efforts to launch the work the publisher, Lebreton, approached Denis Diderot, who at that time possessed a mediocre reputation resting chiefly on his translations of a few English books. Diderot perceived the opportunity to construct an original encyclopaedia of far broader scope than that of Chambers and having won Lebreton to his scheme immediately secured the mathematician d'Alembert as editor-in-chief. D'Alembert, who was perpetual secretary of the Académie des Sciences, brought the support of academic circles.

The spirit of the *Encyclopédie* was defined by d'Alembert in his famous *Discours préliminaire*, which prefaced the first volume. But it was Diderot who really set the enterprise afoot and to whom is due the credit for completing it in the face of obstacles extraordinary even for eighteenth century France. It was he who was chiefly responsible for soliciting and securing the service of collaborators. Celebrated men of letters, Voltaire, Montesquieu and Buffon, were induced to furnish a few articles; but the last two never displayed more than lukewarm interest and Voltaire's position was chiefly that of a sympathetic and, on occasion, critical observer. For the bulk of the articles the editors relied on writers far less known. The most indefatigable contributors were men whose fame rests almost exclusively on their association with the *Encyclopédie*: de Jaucourt, Boulanger and Boucher d'Argis, who wrote on the history of moral philosophy, social science and law respectively. Others like Toussaint, Eidous, Dumarsais, Beauzée and Cahuzac were writers or scholars of second rank. The most famous churchman among the *encyclopédistes* was Morellet, but others of a far more orthodox persuasion—the abbés Yvon, Mallet, Pestré—also belonged to the group. There were a great number of specialists: the medical men Tarin, Louis, Malouin; the watchmaker LeRoy; the mechanician Goussier; the cartographer Bellin; and the architect Blondel. Baron d'Holbach wrote on chemistry. Rousseau, whose philosophy was still in the process of development, was assigned the articles on music and wrote the one on political economy. Most of the articles on economics, however, were written either by Forbonnais or Quesnay. Besides revising the work of his collaborators Diderot supplied missing articles and reserved to himself all subjects pertaining to the history of philosophy as well as to the description of industrial processes, a field in which his work was that of a pioneer.

Freedom from civil and ecclesiastical interference had been guaranteed by a royal decree issued in 1746. Nevertheless, the privilege was revoked twice during the course of publication. In 1752 at the instigation of the Jesuits the Conseil du roi suppressed the two volumes already published, but the editors were allowed to continue with the work. After the appearance of the seventh volume in 1757 the wrath of the church created a far more serious storm, gravitating partly about the publication of Helvetius' *De l'esprit*, the dangerous principles of which were laid to the door of the *Encyclopédie*, partly about d'Alembert's article *Genève*, in which by lauding the tolerance of the Presbyterian citadel the author was supposed to have indirectly censured the intolerance of the Sorbonne. The unfortunate article was fraught with momentous consequences. It antagonized not only the Roman church but the Genevans, who did not relish d'Alembert's compliment; it transformed the immanent irreconcilability between the ideas of the *philosophes* and those of Rousseau into open enmity; and the reactionary opinion which it evoked so disgusted d'Alembert that he thereupon withdrew from the *Encyclopédie*. To cap the difficulty the Conseil du roi, dealing the blow which the *Parlement* of Paris was more deliberately preparing, formally suppressed the *Encyclopédie* in 1759 and forbade its continued publication. Diderot was not to be deterred. Under his direction the ten remaining volumes were secretly printed by Lebreton, who, however, in his solicitude for his own safety mutilated many of the articles; and in 1765 they were delivered under a Swiss imprint to the four thousand subscribers. Diderot remained associated with the enterprise until 1772 when six volumes of plates were published. With the five volumes of supplements and the two volumes of tables which appeared in 1777 and in 1780 respectively he had nothing to do. As soon as it was completed the whole work was copied by foreign publishers and issued in several editions.

The vicissitudinous history of the *Encyclopédie* indicates that it was regarded as a dangerous instrument of propaganda against the church. Its purposes were, however, far broader and more profound. "The aim of an encyclopaedia," wrote Diderot in the article *Encyclopédie*, "is to gather together the knowledge scattered over the face of the earth, to set forth its general plan to the men with whom we live and to transmit it to the men who will come after us, in order that the labors of past centuries may

not have been in vain in those that follow, that our children, better informed, may at the same time become happier, and that we may not die without deserving well of mankind." The *Encyclopédie* was therefore first of all a dictionary, a *summa* or *bilan* of all knowledge, scientific, moral and technical. Wishing to collect "all books into one," the editors drew heavily from all printed material, particularly the dictionaries of Bayle and Moréri, the learned collections published by academies and religious orders, books of travel and legal treatises. Thus the *Encyclopédie* is a vast compilation of very uneven value but containing a definitive record of the state of knowledge and thought—whether individual or social—in the middle of the eighteenth century. In their classification of this knowledge the *encyclopédistes* were deeply indebted to Francis Bacon, whom d'Alembert raised to an eminent pinnacle in the history of thought. Diderot's enthusiasm for Bacon was scarcely more reserved. "If we emerge from this vast operation," he wrote in his Prospectus, "our principal debt will be to chancellor Bacon, who sketched the plan of a universal dictionary of sciences and arts, at a time when there were not, so to say, either arts or sciences."

The enemies of the *encyclopédistes* frequently referred to the group as a sect or a school—the *parti des philosophes*, in Rousseau's phrase. While they do not deserve this title, it is nevertheless true that a common *Weltanschauung* predominates and that in fulfilling the purpose which d'Alembert had described in his *Discours* as the specific function of an encyclopaedia in contrast to a dictionary, namely, to establish a logical bond, *un ordre et un enchainement*, between all aspects of human knowledge, the *encyclopédistes* were in reality presenting the elements of a coherent sociological theory. In voicing their views they were forced to resort to divers subterfuges, some original, some borrowed from Bayle or other eighteenth century writers. They called in the pious abbots Mallet and Yvon to conceal the audacity of a Diderot, a Boulanger or a Damilaville. Many of their ideas were conveyed under cover of the history of moral, philosophical and theological doctrines—a type of historiography of which Diderot was one of the originators. It is nevertheless transparent that the *encyclopédistes*, taking their work as a whole, accepted as a fundamental premise of their thinking the eighteenth century thesis that a natural order exists in the universe. In this premise and its corollaries their real issue with the church inhered. Affirm-

ing the superiority of reason over revelation, they refused to admit the Biblical writings as an authoritative interpretation of human evolution. They declaimed against miracles, superstitions and sacerdotalism in all its manifestations. They attacked Christian morality as insufficient to insure the welfare of the individual, whom it attempts to distract from earthly life, and of society, which it subordinates to personal salvation. They set forth a concept of material, political and moral progress dependent not upon the plans of a transcendent and eternal divinity, but upon intellectual evolution, the influence of science and the light of reason upon the development of social institutions.

The conception of a rational universe ruled by immutable laws, although it was at least as old as the stoic philosophy, owed much of its immediate potency to the dissemination of the Cartesian spirit. But in their general theory of knowledge the *encyclopédistes* represented that reaction from Cartesianism which had been initiated by Locke and popularized in France by Condillac. They denied the existence of innate ideas and condemned categorically if not always functionally all a priori reasoning. Holding with Condillac that all ideas derive from primitive sensations and that all mental functions can be explained as transformation of these sensations, they tended toward a broad positivism, as in the case of Diderot and Boulanger, or toward relativism, as in the case of d'Alembert. Reason gave them an infallible criterion for evidence and furnished the basis for their faith in progress. It remained nevertheless true that reason was merely a faculty combining the data of experience and that man was, as Protagoras had said, "the measure of all things." Or, in the words of Diderot, "one consideration especially that we ought never to lose from sight is that if we ever banish man, or the thinking and contemplative being, from above the surface of the earth, this sublime and pathetic spectacle of nature becomes no more than a scene of melancholy and silence."

Thus speculative interest centered about man and particularly, in view of the eighteenth century notion of progress and perfectibility, about the possibility of ameliorating his terrestrial existence. In this sense the *encyclopédistes* were both humanistic and humanitarian. Their theory of human nature was crude, depending principally upon their psychological doctrines, which they integrated with the ideas of Buffon regarding human origins. Nevertheless, it marks the be-

ginnings of a definite anthropological doctrine designed to supplant the Biblical tradition. It was the natural man or man in his universal essence that they strove to present—a being belonging to the animal series, although at its summit, capable of receiving impressions and of obeying tendencies, subject like the whole universe to causal determinism, responding to external laws according to a universal pattern and progressing by reason of the evolution of these responses or the development of institutions to which he could react. Out of their theory of human nature grew their theory of social origins. Rejecting the contractual hypothesis no less than the supernatural explanation of the theologians, they ascribed the birth of society to the needs of the natural man and then proceeded, according to their characteristic method, to deduce its function from its origin. In order to satisfy human needs society must guarantee private property and furnish individuals with the greatest possible degree of well-being and independence. In their description of social origins the *encyclopédistes* devoted much space to ethnography of primitive peoples, about whom they became informed chiefly through the many books of travel in circulation at the time. Their faith in human progress was, however, too firmly rooted to permit them to slip into Rousseau's systematic apology for the *bon sauvage* or to identify the primitive with the natural man.

The ethical doctrine presented by the *encyclopédistes* was essentially utilitarianism, strongly tinged with the naturalism of Diderot. But while they held that man naturally seeks a good synonymous with pleasure and avoids an evil synonymous with pain they attributed to him an instinctive sympathy drawing him spontaneously toward his fellow men. Once society was established, the common weal began to take precedence over individual welfare; and in their calendar of moral virtues the *encyclopédistes* assigned first rank to those of a social nature: tolerance, labor, justice and philanthropy.

When they turned from discussing natural man and society to considering the principles of the actual social organization of their time the *encyclopédistes* did not conceive a violent rupture with traditional institutions to be necessary. They accepted the monarchical form of government, although they justified it not on the grounds of divine sanction, but by a postulated historical contract, according to which the reigning family promised to rule in the interests of the people and the people pledged itself to obey.

Hostile to tyranny and the regime of privilege, they would nevertheless have willingly adapted themselves to an enlightened despotism, provided that the *philosophes* were permitted to furnish the enlightenment. What they desired was a tolerant government functioning within the limits of the constitution, respecting the "fundamental laws" of the kingdom and manifesting particular solicitude to increase the welfare of the producing classes. In the domain of economic theory the *Encyclopédie* is chiefly important because in it were published the earliest writings of the founder of physiocracy, Quesnay. But certain ideas more or less common to the *encyclopédistes* as a group had an immense effect upon the immediate course of economic and political development. They were at one in perceiving the necessity of fiscal reform and, although their remedy was retrogression to the golden age of Henry IV and Sully, the effect of their protest was to emphasize the evils of the system of finance, as well as of government in general, which had descended from Louis XIV and Colbert. Still more important was their advocacy of the cause of industry, an advocacy in reality amounting to sublimation, since they linked the development of trades and industries, of which they gave detailed and illustrated accounts, to the physical and intellectual progress of mankind. By thus insisting upon the social importance of the commercial and industrial classes the *Encyclopédie* paved the way for their accession to political power. Without demanding revolution, probably without even wishing to imply it, the *encyclopédistes* contributed to the self-consciousness of the bourgeois class, which was destined to accomplish it. The practical reforms which they proposed as potentially realizable within the framework of the *ancien régime*—definition of the constitution, guaranty of individual liberty, state protection of science and industry, reform of the criminal law, limitation of privileges, improvement of administration and in particular of the fiscal system—became the program of the Constituent Assembly of 1789.

In conception, plan and execution the *Encyclopédie* represents the projection of the idea current in the eighteenth century that the progress of mankind can be achieved through the diffusion of knowledge and of reason. It is the typical as well as the consummate expression attained in France by the Enlightenment. A mighty instrument in the molding of eighteenth century French opinion, a force incorporating and uni-

fiying the scattered forces of the *philosophes*, the *Encyclopédie* also has paramount significance from the purely scientific point of view. It was in fact the first great attempt at a positive synthesis of human knowledge. It bestowed upon the social sciences the objective and experimental spirit of the physical sciences and prepared the materials for future research and thought. In the *Encyclopédie* may be found the roots of Turgot's and Condorcet's doctrine of human progress and of the positive systems later constructed by Saint-Simon and Comte.

ENDEMANN, WILHELM (1825-99), German jurist. Endemann was an eminent authority on commercial law and civil procedure. He first attracted attention in commercial law by his valuable *Studien in der romanisch-kanonistischen Wirtschafts- und Rechtslehre* (2 vols., Berlin 1874-83), in which he followed the canonical doctrine of usury through the centuries and combated its errors, particularly that of the unproductiveness of money. Although he did not do full justice in this work to the economic-political bases of the law of usury in the Middle Ages he nevertheless provided an infinitely painstaking survey of older theories of commercial law and furthered in many ways the history of commercial law and of European economic evolution. Endemann also collaborated in the editing and writing of the great handbook of commercial law, *Handbuch des Handels-, See- und Wechselrechts* (4 vols., Leipsic 1881-85), a monumental work in its time but lately superseded by Ehrenberg's handbook. In his *Das deutsche Handelsrecht* (Leipsic 1865, 4th ed. 1887) Endemann strongly stressed economic aspects or practical jurisprudence as against abstract deduction.

Endemann was attracted to problems of civil

procedure as the result of his considerable experience as a judge, and he left his mark especially upon the law of evidence. In a series of works in the *Archiv für die zivilistische Praxis* from 1858 to 1860 he wrote against the formal theory of evidence strongly embedded in the common law procedure of the time and declared for the modern principle of the judge's right to pass upon the materiality of evidence. He was aided in gaining recognition for this principle by his collaboration on a committee for the reform of civil procedure as well as by his membership in the Reichstag. A concise exposition of the common law civil procedure, *Das deutsche Zivilprozessrecht* (Heidelberg 1868), criticized the antiquated procedure of the time in all its aspects and paved the way for its reform.

Endemann was an ardent champion of the economic and purposeful conception of law but, unlike his contemporary Ihering, he undervalued the traditional methods of jurisprudence; hence he was particularly important on the legislative side, where his somewhat one-sided and impatient views, setting comparatively little store upon the gradual improvement of the law through science and practise, were very effective. His historical works are of permanent value.

ERNST HEYMANN

Consult: Schulte, J. F., *Allgemeine deutsche Biographie*, vol. xlviii (Leipsic 1904) p. 358-62; Stintzing, R. von, and Landsberg, E., *Geschichte der deutschen Rechtswissenschaft*, 3 vols. (Munich 1880-1910) vol. iii, pt. ii, p. 949-53.

ENDOWMENTS AND FOUNDATIONS.

The practise of devoting funded wealth to the pursuit of some continuous purpose designated by the donor has existed in almost every society where the necessary institutional and legal stability has been attained; and very rarely has it been challenged or denied. In former times far more than at the present communities were shot through with such manifestations of private will functioning more or less harmoniously alongside those of collective will; and apart from cases where the ends were in some sense individual—chantry endowments, for instance—the causes of charity, religion, education and health have until recent years owed more to private than to public sponsorship. Thus Plato bequeathed his Academy to his successors with an endowment of productive land. The Ptolemies endowed their library at Alexandria; the younger Pliny a school at his native town of Como. Throughout the Middle Ages the endowments of religious orders,

edifices and institutions were the means by which certain social services were regularly performed—the maintenance of the English roads by the monasteries, for example, as well as the upkeep of schools, colleges, orphanages, hostels and hospitals. The central place which the church occupied in mediaeval life, the fact that the unitary state had not yet emerged to take over the performance of public services and the tendency during the later Middle Ages to set up the corporate form of autonomous organization gave direction and spur to these endowments. By Henry VIII's time they were thought to comprise from one third to one half the public wealth of England. Following the Reformation the guilds and companies became the chief disbursing beneficiaries; and even today the status of many English hospitals, charitable institutions, colleges and church livings shows the historical contribution of private will to public purpose.

The eighteenth century saw in both England and France the rise of a critical attitude toward this way of organizing the performance of social services and of disposing of accumulated wealth. Turgot commented on the inability of a donor to "communicate his own zeal from age to age" and Adam Smith remarked that "the effect of endowment on those entrusted with any cause is necessarily soporific." Strict regulation by the revolutionary and succeeding governments in France permanently diminished the total of French charitable endowments. In England a succession of parliamentary commissions from 1818 to 1853, principally under the leadership of Lord Brougham, culminated in the establishment of a permanent Board of Charity Commissioners, which in 1860 on the accepted principle that "charities are trusts of a public nature" received wide powers of control and supervision, including the power to remodel obsolete purposes and amalgamate scattered funds. Despite the vast enlargements since the late nineteenth century in the sphere of collective purposes and the evolution of new organs of collective will the principle of private endowment has continued to discover useful ends not yet absorbed in the public pattern; while the harvest of the industrial and commercial revolutions has placed unprecedented sums at the disposal of private individuals—so much so that the modern foundation is a typically American phenomenon.

Partly on account of the comparatively late rise of large accumulations American endowments have been mainly secular. The religious

impulse has waned and has given way to the purposes of education, social melioration, research and propaganda. While the volume of the individual endowment has in recent times increased almost precipitously, some of the early endowments were interesting in their provisions and influential in determining the form and direction of later ones. Benjamin Franklin, a pioneer in philanthropy as in so many other fields, left £1000 to Boston and an equal amount to Philadelphia in 1790 to be lent at interest to young married artificers of good character. Estimating what each fund would amount to at the end of a century, he provided for the distribution of the major portion of it in "public works which may be judged of most general utility" and for the accumulation of the remainder through another century, at the end of which the whole was to be distributed. The American-English banker, George Peabody (1795-1869), established in 1867 the Peabody Education Fund, which amounted finally to \$3,000,000, for "intellectual, moral, or industrial education among . . . the Southern and Southwestern States." This fund inaugurated and developed elementary and secondary schools until they were taken over by towns and cities, encouraged the development of state systems of public education and promoted the training of teachers. Perhaps the most famous and by example the most influential of early American endowments was the founding of the Smithsonian Institution in 1846 by an Englishman, James Smithson, "for the increase and diffusion of knowledge among men."

Until after the World War, when it lost ground to various forms of social welfare, education occupied the foremost place in American philanthropy. The United States Bureau of Education reported in the academic year 1889-90 that 315 universities and colleges had productive funds amounting to a total of about \$74,000,000, an average of about \$234,926 each. The figures for 1899-1900 showed 488 institutions with \$166,000,000 of endowment, an average of \$340,000. In 1928 the endowments of 1076 institutions amounted to about \$1,150,000,000, an average of more than \$1,000,000 each. During the thirty years that elapsed between the Report of the Commissioner of Education for 1897-98 and the Biennial Survey of Education for 1926-28 there were reported accessions of endowment increasing roughly speaking from \$3,000,000 to \$24,000,000 at Johns Hopkins University, from \$4,000,000 to \$58,000,000 at Yale, from \$9,000,000 to \$63,000,000 at Columbia and from

\$10,000,000 to \$86,000,000 at Harvard. These developments are characteristic of privately supported institutions, which care for two thirds of the university and college students in the United States. The recent and increasing flow of gifts from individuals to institutions that are owned and controlled by cities and states is illustrated by private endowments of \$6,000,000 at the University of Cincinnati, \$10,000,000 at the University of California and \$12,000,000 at the University of Michigan.

How completely the typical large foundation of today is a product of modern conditions is attested by the fact that of the more important extant foundations in America only seven originated in the nineteenth century. "As generally understood today," says Frederick P. Keppel, "a foundation is a fund established for a purpose deemed 'charitable' in law, administered under the direction of trustees customarily operating under State or Federal charter and enjoying privileges with respect to taxation and continuity of existence not accorded to 'noncharitable' trust funds. The fund is to be used for a designated purpose, broad or narrow as the case may be, the donor specifying whether the principal is to be kept intact or whether not only interest but principal may be spent for the purpose named. Though the practise is not uniform, it is the tendency to designate the former as Foundations and the latter as Funds." A survey of the field made in 1930 by Evans Clark, the director of the Twentieth Century Fund, finds that 108 important foundations of national or international scope operating in the United States control more than \$1,000,000,000 of funds and disburse about \$60,000,000 a year. The channels into which this distribution flows, as for the period 1929-30, are shown in the following table. It will of course be understood that the same foundation may appear in connection with several purposes: the last four objects on the list, for example, are all within the scope of the American Fund for Public Service established by Charles Garland.

The modern foundations are prevailingly the result of the benefactions of a handful of men. Of these the most widely known name is that of Andrew Carnegie, who retired from business to devote the ability and energy which had accumulated a fortune at that time almost without parallel to distributing nine tenths of it during his lifetime. Two thirds of his public distribution of \$300,000,000 went toward the establishment, endowment and development of eight perma-

THE FLOW OF AMERICAN PHILANTHROPY

ESTIMATE OF THE ANNUAL DISBURSEMENTS OF AMERICAN FOUNDATIONS

PURPOSE	NUMBER OF FOUNDATIONS	AVERAGE ANNUAL GRANTS
Education	36	\$30,500,000
Individual aid	48	9,000,000
Scientific research	33	7,000,000
Health	22	4,000,000
Child welfare	26	3,500,000
Aesthetics	9	1,000,000
Social welfare	18	900,000
International relations	12	800,000
Industry and business	7	750,000
Religion	3	600,000
Government	4	550,000
Genetics and eugenics	3	400,000
Aviation	1	150,000
Agriculture	3	130,000
Publishing	2	90,000
Public service	1	50,000
Propaganda for social theories	3	45,000
Legal aid	2	35,000
Miscellaneous	—	59,000
Engineering

nent foundations, of which the Carnegie Corporation of New York, established in 1911, is the largest and which have among their purposes the advancement of research and education in various fields and the advancement of peace. John D. Rockefeller and John D. Rockefeller, Jr., have included in varied benefactions, which approximate \$600,000,000, the establishment, endowment and development of five large foundations having for their purpose research in medicine, social science and other fields, education and welfare programs. The various Carnegie and Rockefeller foundations constitute the most far reaching network of agencies for the administration of huge sums of money. Other well known foundations having resources of \$10,000,000 or more each are the Milbank Memorial Fund for studies and demonstrations of child welfare, mental hygiene and individual and community health; the Russell Sage Foundation in the field of social work; the Commonwealth Fund for varied welfare and social work; the Juilliard Musical Foundation of New York for musical education; the Duke Endowment for universi-

ties, hospitals and rural churches; and the Julius Rosenwald Fund for the health and education of Negroes, backward races and persons of small means. Of the European foundations with an international scope probably the best known is that of Baron Maurice de Hirsch, who founded in England the Jewish Colonization Association for Jewish emigration, schools, cooperative factories, savings and loan banks and model housing throughout the world; the Nobel Foundation in Sweden grants prizes for achievement in physics, chemistry, physiology, medicine, idealistic literature and world peace; the Rhodes scholarships support at Oxford students from the British Commonwealth, the United States and Germany. Similarly in the United States the Commonwealth Fund enables graduates of British or colonial universities to study in the United States; the John Simon Guggenheim Memorial Foundation sends American students for advanced study in Europe and has announced similar fellowships between the United States and Latin America; since 1919 numerous appointments have been arranged by the Institute of International Education.

Criticism of the foundation, both as to its nature and as to its function, has in recent years become increasingly acute. It has been pointed out that its economic basis is the concentration of wealth in a small class in a capitalistic society, its psychological basis the building of personal prestige or the salving of conscience and its ideological basis the relegation of important functions of education, melioration and control to the agencies of a militant individualism. There can be no doubt that the increase in number and magnitude of American endowments has coincided with a persisting inequality in the distribution of the national income. Recent studies suggest that the concentration of income is increasing rather than diminishing, and such facts as the increase in the number of million-dollar income recipients from 290 in 1927 to 496 in 1929 (of whom 24 were in the five-million class) have attracted much critical comment. It is interesting to note in this connection that the year 1927-28 added over \$93,000,000 to foundation funds apart from foundation gifts to universities, hospitals and the like. It is also relevant in this connection to point out the increasing control of economic life by a small number of giant corporations. A recent and important study (Means, Gardiner C., "The Growth in the Relative Importance of the Large Corporation in American Life" in *American Economic Review*, vol. xxi,

1931, p. 10-42) shows that the two hundred largest non-financial corporations control from 35 to 45 percent of all business wealth; their total directorates in 1927 comprised fewer than 2000 men, an important proportion of whom were of course inactive. To these facts may be added the concentration of the nation's financial resources under bank and insurance company control. It is thus evident that both the resources and a large part of the responsible personnel of the modern foundations may derive from an economic situation which is itself open to grave criticism.

The suspicion of the foundation as such which has thus arisen has been reenforced in certain cases by objections to the methods employed—toward labor, competing concerns, or the public—in the amassing of the original accumulation, particularly in instances where those methods have been the subject of government investigation. The cry of "tainted money" has sometimes been raised by objectors on these grounds; and there may perhaps be occasion here and there for Burke's description of an endowment as "the usual fruit of a late penitence." Those for whom the very possibility of the accumulation of such individual fortunes as the Guggenheim, Rockefeller, Harkness and others is in itself a symptom of radical inequity in the economic system are unlikely to be satisfied by any amount of good intentions or good works in the disposal of such funds. To them Carnegie's doctrine of the stewardship of the millionaire, as expressed in his often quoted *The Gospel of Wealth* (New York 1900) will remain unconvincing—"the millionaire will be . . . intrusted for a season with a great part of the increased wealth of the community but administering it for the community far better than it could or would have done for itself . . . disposing of surplus wealth . . . by using it year by year for the general good." Even if the process by which such wealth were amassed contained in themselves a guaranty that every millionaire fitted Carnegie's description, objection might still be raised.

What a more uniform distribution of incomes or a more drastic appropriation of surplus by the state might accomplish with respect to the functions undertaken by the foundations must be left to collectivist theory and experiment. It can scarcely be denied that the foundation as representing private will operating through the power of wealth can more readily compass certain purposes. For example, there is an increasing tendency for the activities of recent foundations to take on an international character that state ac-

tion, as it has been hitherto conceived under the influence of nationalistic ideas, seems hardly disposed to assume. It has also not yet been demonstrated satisfactorily that state action, which has in the past been intent on immediate results, would be ready to sponsor protracted and costly pieces of research the outcome of which may be entirely uncertain—a field in which, according to F. P. Keppel, perhaps the chief opportunity for foundation enterprise lies.

Similarly, the sponsorship of new social techniques that are still in the experimental stage and may require years to prove or disprove their value—for example, mental hygiene, adult education and radio education—is undertaken to great advantage by private foundations; but here the question arises whether the scope of experimentation with new social techniques is not seriously limited, by the source and administration of foundation funds, to those techniques which fit into the existing social system rather than change it in any essential way. Successful pioneering work by private foundations has, however, in the past encouraged public activity in the same field, particularly where the individualist tradition survives as strongly as in official America. The fact was recognized in the majority report of the Congressional Commission on Industrial Relations published in 1916, which went so far as to say that “almost everything that Government now does was done at first through private initiative. . . .”

The foundations have also done excellent work in providing opportunities for study or creative work for selected individuals. The best opportunity of this kind that public activity can at present provide (apart from a few instances like the British Civil List) is a scholarship system; the foundations by a different type of selection and support can fulfil a different need—as is signally illustrated in the awards to young creative workers in the arts and sciences made by the Guggenheim Foundation.

It is no doubt theoretically possible that public funds might be applied by public authority to all such purposes as the foregoing. But experience gives little encouragement to that prospect; and in the meantime it may be maintained that foundation activities, while by no means justifying the economic situation out of which they spring, do at least in part wring good out of its defects. The argument has also been advanced that in return for the privileges of incorporation and tax exemption a larger measure of public control should be imposed upon foundations. It

is questionable, however, whether such control would add to the social efficacy of the foundations or whether it might not jeopardize their freedom in precisely those types of endeavor for which they are most suited.

The most generally canvassed defect in the present organization of foundations is that of the “dead hand”—the survival of purposes, conditions or limitations arising from the will of the donor in circumstances to which they are no longer suited. A number of early endowments were so rigid in their specifications as to make them inapplicable in later times; and there have been restrictive court decisions, like that concerning the McKay bequest to Harvard University: “The income of the . . . endowment must be administered according to the intention of the founder . . . even though it be at variance with our views of policy and expediency.” In England the removal of any undue rigidity is now a simple matter through the Charity Commission, which may modify the procedure of a philanthropy or abolish it altogether. In the United States, when absolute compliance with the provisions of a charitable trust has become impossible, courts have sanctioned a carrying out of the donor’s general intent. The right is retained by Congress to alter, amend or repeal at any time any act incorporating a philanthropy and by the various legislatures to impose later limitations upon any philanthropic charter granted by them. The change in the attitude of donors is indicated by Franklin, who set a standard of desirable flexibility by entrusting the procedure of his donations to the discretion of their managers; while Carnegie empowered his trustees to spend the income of his endowments for purposes different from those he specified, should this come to seem desirable. During the last fifteen years a considerable number of community trusts, in which funds are cared for by banks and trust companies and income is distributed through committees named by judges and representative associations, have received large contributions for current expenditure and a considerable number of permanent funds, smaller than those of the larger foundations, for general or particular purposes, which are subject to change according to future conditions.

A wider aspect of the same question arises with regard to the conservation or distribution of the capital endowment. Both practise and theory show wide variations. The Duke Endowment is required to reinvest one fifth of its income until this accumulation equals the original gift. The

various Carnegie endowments and a majority of other philanthropic foundations may expend only their income. Among universities and colleges it is generally considered reprehensible to use capital funds for current expenses. On the other hand, the Rockefeller foundations are empowered to expend principal as well as income and have distributed approximately \$250,000,000 from their capital funds. The Julius Rosenwald Fund is required to expend both income and principal within twenty-five years after the death of the donor. Julius Rosenwald has stated the case against perpetuities in terms that have won considerable assent. The danger of tying up trust funds to specific purposes, especially in times of rapid social change, has already been alluded to. In Rosenwald's view, however, even the most general purposes do not constitute a claim for perpetuity of endowment. "We may be certain," he says, "that . . . the acute social need of tomorrow will be different from that of today and will doubtless call for a new kind of agency to meet it. The splendid service that Hull House and Henry Street are giving under their present leaders is the strongest argument for putting all the resources they can obtain into their present activities." Recent endowments—particularly the \$10,000,000 Children's Fund of Michigan established by Senator James Couzens in 1929—show the influence of this argument in their terms.

Most American foundations are under the control of self-perpetuating boards of trustees, whose duties — and whose problems — have marked resemblances to those of a college board. The self-perpetuating principle, although difficult to avoid, entails a certain danger: "I think it is almost inevitable," writes Rosenwald, "that as trustees and officers of perpetuities grow old they become more concerned to conserve the funds in their care than to wring from those funds the greatest possible usefulness." The Rockefeller Foundation and the General Education Board, it may be noted, have recently adopted the policy of retiring both trustees and officers at the age of sixty-five. A further danger, not altogether confined to the trustees of foundations, is that of "cliquishness"—drawing on too narrow a group or too restricted a type for their personnel.

The quest for worth while ends to serve in the field of social welfare is bringing the foundations into ever closer contact with universities and other organizations active in this field. Keppel notes, for example, that the first \$2,000,000

granted by the Carnegie Corporation in 1911 and 1912 was in direct response to applications; of the \$2,000,000 voted in 1928, 68 percent involved consultation with outside organizations. The practise of consultation is spreading among foundations which formally originate and carry out their own projects as well as among those whose main function is sponsorship. The Social Science Research Council—an association of seven professional societies—has frequently acted in an advisory capacity to various foundations and serves to some extent as a planning department for projects. Foundations also frequently engage specialists in particular fields as temporary advisers or executives in place of permanent staff officers.

Certain minor but embarrassing defects on the procedural side are generally admitted. One is the frequent absence of sustained interest in and evaluation of long term projects once their support has been arranged for. It is inherently difficult for a foundation to keep in close touch with the progress of a technical project and yet steer clear of interference. Persons (especially trustees) who are competent to do the former find a certain difficulty in doing the latter. Connected with this is the problem of judgment as to when to increase, diminish or withdraw support. Officers of foundations, like other people, are sometimes impatient for tangible results, and in certain cases promising endeavors have been left in mid-air or "wished onto" operating institutions for final codification through a premature failure of interest on the part of the endowing authority. On the whole, however, defect lies in a plethora rather than a shortage of support. It is impossible to deny that in some recent cases the mountain has brought forth a very small mouse. That there should frequently be extravagance in the personnel and equipment of the foundations is naturally to be expected.

For none of the above defects or difficulties, however, is more public supervision an obvious remedy; and it would certainly imperil the essential character of foundation activity as the manifestation of private will devoted to public purpose supplementary to and frequently in advance of collective will. The same reflection applies to a more general criticism sometimes directed to foundation work. Foundation policies, like their trustees, reflect to some degree their economic origins. It is no derogation of the able and public spirited men who serve in this manner to remark that their ideas are hardly likely to run counter to the basic trends of the society

that has produced the foundations or that their policies are likely to be palliative or ameliorative rather than radical. Cases on which their influence has been exerted in positive hostility to radical ideas or activities, although not absent from the record, are few and hard to substantiate; more important perhaps is the effect of an attitude of hopeful expectation on the part of those who would like to benefit by endowment in the future. The increase in publicity of foundation activities on the one hand and of public and professional vigilance on the other is probably a sufficient—and is in any case the only—safeguard against undesirable tendencies.

ENEMY ALIEN. The concept of enemy alien and the treatment accorded to individuals falling within this category have passed through various historical stages, from the time when every foreigner was regarded as the foe of the political community to the more modern period when the concept has been subjected to legal definition and refinement and has become the basis for a well recognized portion of the international law of war. This development commenced as soon as the problems of war, jurisdiction and allegiance ceased to be colored by the ideology of feudalism and began about the time of Grotius to reflect the realities of the state system of modern Europe and the emerging nationalism which has become its most distinctive characteristic. For

the past four centuries western European jurisprudence has recognized that nationals of a state at war with the local state may lawfully be subjected to various restrictive measures. In the language of the British Aliens Restriction Order of 1914 (no. 1374, September 9, 1914, § 31), "'alien enemy' means an alien whose sovereign or State is at war with His Majesty" [see *Sparenburgh v. Bannatyne*, 1 Bos. & P. 163 (1797)]. Such persons are placed in a quasi-criminal class and treated in such fashion as to prevent them from aiding the enemy state in any way, from interfering with the conduct of hostilities on the part of the local state and, more recently, from becoming the victims of mob violence [*Schaffgenius v. Goldberg*, 1 K.B. 284 (1916); *Porter v. Freudenberg*, 1 K.B. 857 (1915)].

During the later Middle Ages and the Renaissance it was the general practise of states to arrest all enemy aliens at the outbreak of war, detain them as prisoners of war and frequently confiscate their property and treat them as outside the protection of the law. With the growth of commercial contacts and the rise of an international law directed toward mitigating the hardships of war, states began to conclude treaties specifying a period of time after the outbreak of war between the parties during which their subjects should be permitted to depart freely from each other's territory. The American treaty of 1799 with Prussia contained provisions, reenacted in the treaty of 1828 and still in force in 1917, under which citizens of either country in the event of war could depart from the other with all their goods within a period of nine months. Such treaties became so general during the seventeenth and eighteenth centuries that it came to be accepted as a customary rule of international law that enemy aliens who were not members of the enemy's armed forces should be allowed a reasonable time for departure (see United States, Code of Laws, Title 50, sect. xxii; Oppenheim, L. F. S., *International Law*, 2 vols., 4th ed. London 1926-28, vol. ii, p. 204-06).

These tendencies have recently been reversed as a result of the revolution in the nature of warfare in the nineteenth and twentieth centuries. With the introduction of universal military service and the transformation of war from a contest between professional standing armies into a struggle between whole peoples, military necessity dictated an effort, on the one hand, to limit the human and material resources of the enemy in every way possible and, on the other, to prevent any interference by resident nationals

of the enemy state with the successful prosecution of the war. The importance of man power and of espionage have therefore led to attempts to prevent enemy aliens from departing and to various restrictions upon their freedom of movement within the country. At the outbreak of war in 1914 Germany and Austria-Hungary prevented all enemy subjects from leaving their territory. Great Britain allowed Germans to leave up to August 10, 1914, and then subjected those remaining to a great variety of prohibitions [Aliens Restriction Act, 4 & 5 Geo. V, c. 12 (1914); and Defence of the Realm Consolidation Act, 5 Geo. V, c. 8 (1914)], culminating, after the anti-German riots which followed the torpedoing of the *Lusitania*, in the repatriation of enemy aliens unfit for military service and the internment of the remainder (some 45,000) in concentration camps for the duration of the conflict. France and Germany also resorted to internment; the United States did not regard the step as necessary. A number of agreements between France and Germany provided for the reciprocal repatriation of nationals unfit for military service. An act of the French parliament of April 7, 1915, provided for the denationalization of all naturalized French citizens of enemy origin. In the United States the president's proclamation of April 16, 1917, laid numerous restrictions upon the movements of enemy aliens and in November, 1917, they were required to register.

On the continent with few exceptions the rule was well established by 1914 that resident alien enemies were not barred from access to the national courts, the fourth Hague convention of 1907 (article 23h) being interpreted in this sense. In Great Britain and the United States the rule survived that enemy aliens were prevented from taking legal action. During the Great War the latter again became the general rule, although with many exceptions which allowed even interned aliens to appear as plaintiffs in certain circumstances. The American Trading with the Enemy Act of October 6, 1917 (40 Stat. 411, c. 106), barred enemy aliens from access to the courts except in cases arising out of business which they were licensed to transact [Schultz v. Raimes & Co., 166 N. Y. Supp. 567 (1917); Speidel v. N. Barstow Co., 243 Fed. 621 (1917)]. Such disabilities are of course temporary, and usually legal proceedings are merely stayed for the duration of the war. The peace treaties of 1919 provided that access to the courts should be restored within three months after the coming

into force of the treaty (article 300, Treaty of Versailles).

Property rights as well as personal rights of enemy aliens have been reduced in recent practise, especially during the Great War, to smaller scope than they had a century ago. Reciprocal security of the persons and property of alien enemy merchants was contemplated as early as 1215 in England (Magna Carta, chapter 42). Except for the mutual seizure of private enemy property in France and England in 1793 and the action of the Confederate States of America in 1861, the old practise of confiscating the private property of enemy aliens and of annulling debts due them became obsolete during the nineteenth century [Wolff v. Oxholm, 6 M. & S. 92 (1817)]. Many treaties forbade such confiscation. During the Great War, although no right of confiscation was expressly reasserted, the custom of confiscation was practically revived through a series of exceptional war measures enacted in the early months of the war by England, Germany, France and other belligerents. In the United States it had been held that a state of war gave the legislature a right to confiscate enemy property [Brown v. U. S., 8 Cranch 110 (1814)]. Under the Trading with the Enemy Act of 1917 the alien property custodian was instructed to seize the property of enemy aliens and in 1918 he was authorized to sell any property in custody with the object of rooting out German influence by destroying German property holdings in the United States [Central Union Trust Co. v. Garvan, 254 U. S. 554 (1921); Stoehr v. Wallace, 255 U. S. 239 (1921)]. In the main these measures, taken in the name of "sequestration" and "conservation" but amounting to confiscation, were not applied to the property of resident enemy aliens but only to those domiciled in Germany.

The peace treaties generally provided for the complete restitution of public and private enemy property held by the defeated powers and a partial restitution of property held by the victorious powers after the claims of their nationals against the former enemy governments had been satisfied. A series of arbitrations has adjusted the various property claims, but it is apparent that the once widely accepted principle of the immunity of private enemy property from confiscation has been superseded by the practises reviewed above. It is equally apparent that the practise of interning resident enemy aliens has become prevalent. In short, the pendulum has swung back from liberal treatment to an ap-

proach to the harsher methods of a much earlier period. This is but a reflection of changing conceptions of warfare. In combats between whole peoples in highly industrialized societies the practise of governments will inevitably reflect the demands of mass strategy and the intensification of national enmities. The rights of enemy aliens would therefore seem to be in process of progressive diminution under the stresses and strains of international conflict under contemporary economic and psychological conditions.

ENFANTIN, BARTHÉLEMY PROSPER (1796-1864), French political theorist and industrialist. Enfantin studied at the École Polytechnique and followed family tradition by going to work in a bank. He shortly thereafter became a follower of Saint-Simon and was one of a small group who received his last instructions. After Saint-Simon's death Enfantin founded a magazine, the *Producteur*, and became a codirector of the École Saint-Simon. On the resignation of Saint-Amand Bazard (1791-1832), his colleague, Enfantin became sole director. He changed the school from an institution devoted to social science into a Saint-Simonian religious sect with rites and clergy. Enfantin had messianic pretensions and became known as the "Pontiff of the New Jerusalem." He attacked traditional marriage and aroused antagonism by his theories of sex relations. His popular following fell away, and in 1832 he retired to his estate at Menilmontant with a group of forty apostles. There he hoped to demonstrate the possibility of harmonious social existence, engaging in farm work to the strains of pleasant music and wearing bizarre uniforms. Enfantin was sentenced to a year in prison on charges of illegal association, affronts to public morality and incitement.

After a long sojourn in Egypt, where he studied the plan of the Suez Canal, thus sharing an important interest of Saint-Simon's followers, Enfantin returned to France and became a merchant. He undertook the consolidation of the

railroads between Paris and the Mediterranean and became a director of the new corporation. He later became manager of the Crédit Mobilier of the Pereire brothers, one of whom, a pupil of Enfantin, built the first French railway.

Enfantin's last project was the Crédit Intellectuel. He recommended financial subsidies for young people who "need 6000 francs before they can earn a sou." "Credit builds up morale," he declared, adding that there should be an intellectual stock exchange like those for money and commercial products. This project may be considered the forerunner of the post-war movement in France to establish a confederation of intellectual workers.

ENGEL, CHRISTIAN LORENZ ERNST (1821-96), German statistician. Engel was born in Dresden. Upon the completion of his studies as a mining engineer at Freiberg he visited the mining districts of Europe, studied mining in Paris and drew his first inspirations for social economics from Le Play and for statistics from Quételet. After serving for some time on an official commission of inquiry on industry and labor in Saxony he organized the first German general industrial exhibition in Leipzig in 1850. He was director of the Saxon statistical bureau from 1850 to 1858, and in 1860 succeeded Dietrich as director of the Prussian statistical bureau, a post from which he retired in 1882.

Engel had a firm belief in the application of the quantitative method to the study of social phenomena and spent a lifetime in providing the social sciences with reliable statistical material. In Saxony he organized official statistics

and edited several volumes of a source book of statistical material as well as the yearbooks and the magazine published by the Saxon statistical bureau. In Prussia he introduced publications of similar type and reformed the census methods by the introduction of the individual census card. He also initiated international steam power statistics and in 1862 founded the first German seminar of statistics and social science in Berlin. Engel also demonstrated the fruitfulness of the use of statistics in studying consumption. He calculated the percentages for types of expenditure in the budgets of workingmen's families published in Le Play's *Les ouvriers européens* (Paris 1855) and Ducpétiaux' *Budgets économiques* (Brussels 1855) and stated the so-called Engel's law. As generally formulated at present it reads: the smaller the family income, the greater the proportion of the income spent on food. He also devised a new measure of consumption, taking as a unit (named quiet in honor of Quételet) the value of consumption of a child up to one year of age and adding 0.1 of this unit for every further year until the end of the period of growth—twenty-five years for males and twenty years for females. He used this method effectively in a comparative study of Belgian workmen's budgets and found a considerable rise in their standard of living between the years 1853 and 1891. He hoped to make similar studies of other population groups, German as well as foreign, with a view to establishing the degree to which their standard of living approximated the "normal" level of welfare, the *Volkswohlstand*, which he understood to be that level of welfare at which people spend a maximum of 80 percent of their income for the "reasonable" satisfaction of material needs, with the remainder reserved for "higher" cultural needs. He hoped to incorporate his monographs into a synthetic study of the basic elements of society, by means of which he intended to work out the balance between cost value and productivity value of man; but only one small tract of it appeared in the form of a pamphlet, *Der Werth des Menschen* (Berlin 1883). Engel was of the German liberal school, much inspired by Carey's social optimism, with definite leanings toward labor and the cooperative movement.

ENGELS, FRIEDRICH (1820-95), social theorist and revolutionist. Engels shares with Karl Marx the distinction of being the founder of scientific socialism. He was born in Barmen, Germany, of a prosperous commercial family. Although reared in an intensely pietistic Protestant atmosphere he soon broke completely with his religious traditions. He was affected by two intellectually dissident movements, Young Germany and the Young Hegelians, and was influenced especially by Börne and Gutzkow among the former and Strauss, Bruno Bauer and Feuerbach among the latter. His first book, *Schelling und die Offenbarung* (Leipzig 1842), for many years attributed to Bakunin, was an anonymous attack upon Schelling from the standpoint of left Hegelianism. During the early forties Engels contributed to periodicals on *belles-lettres*, politics and philosophy under the pseudonym of Oswald. In 1842 he left Germany to take a position with a firm in Manchester, England, in which his father had shares; there he acquired a knowledge of laissez faire economics, the social presuppositions of which he subjected to criticism in his essay "Umriss zu einer Kritik der Nationalökonomie" (in *Deutsch-französische Jahrbücher*, ed. by A. Ruge and Karl Marx, Paris 1844, p. 86-144). He also wrote at this time for Chartist and Owenite papers. In the fall of 1844, when in Paris on his way to Germany, Engels met Marx, whom he had previously known in 1842, and their lifelong friendship and intimate collaboration began. Engels first acquired a European reputation through his book *Die Lage der arbeitenden Klasse in England* (Leipzig 1845, 2nd ed. 1848; tr. by F. K. Wischniewetzky, New York 1887), which reflected Chartist influence. The years from 1845 to 1850 he spent in France, Germany and Belgium, organizing the underground revolutionary groups and collaborating with Marx on various publications including the *Communist Manifesto*. In 1849 he took active part in the republican insurrection in Baden. After 1850, when hope of immediate revolution in Europe faded, he reluctantly returned to England to engage in business and from his income was able to provide for Marx while the latter was engaged in writing *Das Kapital*. He retired from business in 1869 and devoted the rest of his life to literary and practical revolutionary activity. He

was a member of the General Council of the First International and played an important part in the early years of the Second International. In this period he developed the philosophy and sociology of Marxism and after Marx' death edited the second and third volumes of *Das Kapital* from rough drafts and notes left by Marx. His periodical articles and letters on moot points of socialist tactics and theory, written at this time, exerted considerable influence.

Engels' important polemical work, *Herrn Eugen Dührings Umwälzung der Wissenschaft* (Leipzig 1878, 5th ed. Stuttgart 1904; tr. by A. Lewis as *Landmarks of Scientific Socialism, "Anti-Dühring,"* Chicago 1907), presents a Marxist synthesis of the dialectic method of German classical philosophy liberated from its husk of idealism; of the tradition of empirical naturalism sharply distinguished from the metaphysical varieties of materialism; and of the socialist principles of the French and English reformers freed from utopian phantasy. An emphasis upon Marxism as a theory of social revolution is manifested throughout the book. Marx wrote a section (pt. ii, ch. x); and as Engels submitted the entire book to him before publication, some critics regard it as an expression of common views.

An exposition of the fundamental principles of dialectical materialism together with a suggestive treatment of the nature of social causation is found in Engels' *Ludwig Feuerbach und der Ausgang der klassischen deutschen Philosophie* (Stuttgart 1888, 2nd ed. 1895; tr. by A. Lewis, Chicago 1903). He differentiates dialectical materialism from traditional materialism by pointing out that it is a monism not of stuff but of law. Since it denies that all categories are reducible to the categories of mechanics, the progress of science toward a more tenuous conception of matter cannot invalidate its position. The necessary and sufficient conditions of matter are defined to be an independence of the knowledge relation or any other aspect of consciousness and the exercise of specific compulsions upon human behavior. Dialectical materialism differs from metaphysical materialism in accepting a radically evolutionary view of the universe. It recognizes the autonomy of the historical process and avoids fatalism by insisting that the nature of social causation must be distinguished from the type of causation which operates in the physical and biological sciences. In his letters to Mehring and Bernstein in the last years of his life Engels extended the scope of the materialistic concep-

tion of history. He acknowledges the importance of tradition, the presence of interaction and reciprocity and the relative independence of formal elements in the cultural process.

Engels' views on the origin and nature of the state were expressed most clearly in his *Der Ursprung der Familie, des Privateigentums und des Staats* (Hottingen-Zurich 1884, 8th ed. Stuttgart 1900; tr. by E. Untermann, Chicago 1902). This work as a whole was based on Lewis H. Morgan's *Ancient Society* (1877) and Marx' notes to the book and applies the evolutionary hypothesis of classical anthropology modified by historical materialism. But his views here presented on the nature of the state were derived primarily from an analysis of contemporary state forms and were expounded in the *Communist Manifesto* and subsequent writings long before either he or Marx had heard of Morgan and are not therefore dependent upon the validity of the latter's anthropological theories. Marx and Engels' conception of the state as an executive committee of the ruling class was forged from their revolutionary experience in the class struggles of the day, from their disillusion with the forms of bourgeois democracy and from their belief in the necessity of a proletarian dictatorship as a transitional state form between bourgeois society and the classless society. The influence of this theory upon recent revolutionary politics is best illustrated in Lenin's *State and Revolution* and in contemporary Communist philosophy.

ENGINEERING is an inclusive term embracing the discovery through research of laws and the formulation of principles and methods of

utilizing them through the design, construction, maintenance and operation of mechanical and other devices. The content of the science and art was first identified with discovery and utilization of the physical, chemical and electrical properties of matter, as in the design and construction of roads, bridges, buildings and machines. Later it was extended to include problems of the service and economy of such devices, as in determination of the commercial value of a proposed railroad. At present there is a tendency to enlarge its content still further and identify as engineering any organized activity which involves research, formulation of principles and design of mechanisms, including even systems of group conduct, for the benefit of man—as illustrated in management, production and sales engineering. The extent of this tendency is indicated by the recent appearance, although they have not established their validity, of the terms human and social engineering.

Engineering of some type and in some degree has existed since the beginning of recorded history and every civilization has contributed to its development. Man as a tool using animal early made contrivances for his convenience and thus began to store up principles of design and construction. For many centuries this body of experience was in the nature of craft knowledge and skill, but recently it has achieved the status of a body of professional knowledge and technique. Exactly when craft merged into profession it is impossible to say, for the evolution has been gradual and continuous. One may safely generalize so far as to say that the transformation began with the influence of scientific method in the Baconian period, was accelerated by the accumulation of wealth during the period of exploration, discovery and the development of commerce following Drake and burst into full flower during the century following Watt's invention of a means of harnessing the gigantic powers of nature. The experimental method, the substitution of natural for human energies, the vast extension of human wants and the acquisition of a surplus of wealth over immediate needs for application in contrivances designed to create satisfactions of future needs—these are the foundation stones on which have been reared the science, art and profession of engineering.

In the premodern period the absence of power other than that contained in individual human energy and, for restricted uses, in wind and water limited the application of engineering ingenuity to simple contrivances for individual

use, such as the lever and pulley; to larger contrivances of a static nature which could be constructed by the application of individual energies, such as roads, bridges and public buildings; and to contrivances of a dynamic nature which could be operated by human energy organized in gangs, such as small blast furnaces and galley ships. Hydraulic power was utilized in an occasional water wheel, and wind power in windmills and ships under a hundred tons. At every turn dependence on human energy imposed restrictions on the application of creative ingenuity. Notwithstanding these limitations the premodern period was remarkably ingenious and creative and developed an aggregate of basic although disconnected arts and mechanisms which constitute important elements of modern engineering. Before the Christian era there were mines and quarries with shafts and tunnels of amazing depth and length; a metallurgy which knew all basic metals and some alloys and used grinding mills, crucibles and even small air blowing furnaces; metal working which mechanically and chemically possessed a technique that in some respects has not been surpassed; woodworking which utilized saws, planes, drills and carving tools; an agriculture with hoes, sickles, scythes, crude plows, machines for grinding cereals and presses for oils and fruits; small factories for the ceramic arts; glass manufacture by casting, blowing and rolling into small sheets; and a textile industry with spinning wheels, hand and foot operated looms, bleaching, dyeing and pressing. The engineering involved in this culture knew and used devices for measuring and weighing, levers, screws, pulleys, wedges, inclined planes, runners, wheels, cogwheels, slings, small cranes and capstans.

Engineering more like that of the modern era was involved in the construction of early public works. In many of the ancient empires there were graded, crowned and bridged military roads and fortifications with walls, towers, gateways and moats planned and constructed according to mathematical calculations and measurements. Sections of many early cities were planned and laid out according to design. There were simple systems of public water supply and sewerage and reclamation systems with dams, irrigation and drainage. Harbors were constructed with great care and included lighthouses, dredged channels, breakwaters, wharves, warehouses, cranes, windlasses and water supply. The size and design of temples, cathedrals and other public buildings are more familiar to stu-

dents of premodern culture. The premodern engineer-contractor was held in high esteem and was an individual of power and influence.

The industrial revolution, based on the substitution of nature's energies for man's, was essentially an engineering revolution. During the following century engineering and its allied arts became the basis of western civilization. The relations between it and other elements of that culture were reciprocal. Engineering created the surplus wealth which permitted culture to make ever greater demands upon its service, thus leading to the development of a more extensive and intensive, differentiated and creative engineering technique.

It was in western Europe that modern engineering had its origin, and these countries were long preeminent and have never been surpassed in engineering science, invention and design; but it is the United States, the first nation to apply modern engineering to the exploitation of a virgin continent of rich resources, which has been outstanding for the variety and scale of its practical application of engineering design and technique. The magnitude of the task in the new continent and the abundance of the resultant social income permitted specialization and the differentiation of engineering into many special fields, first of practise and later of research. As a result the United States is at present noteworthy for the scientific quality and the precision of its engineering technique. Russia, now beginning her industrial revolution with twentieth century techniques, may in the next century achieve results equally noteworthy and influential.

The accumulated data of modern engineering knowledge constitute a very considerable literature, which is constantly being enlarged by the activities of the vast laboratory of engineering research and education constituted by the universities and large private enterprises of western Europe and North America. Modern engineering has an increasing knowledge of the nature of materials and the methods of creating new synthetic materials, greater knowledge of the nature, origins and forms of energy, and greater precision in measurement. It has an ability to design and construct mechanisms of huge size, power and certainty of performance. It has even gone one step further and developed innumerable attachments of similar precision which regulate and control these huge contrivances without dependence upon variable and uncertain human energy and attention.

Another characteristic of modern engineering

technique is the extension of the area of its concern to the organization, direction and economics of the use of mechanical contrivances. This larger responsibility has been forced upon it by circumstances. The majority of engineering works both public and private require the raising and appropriation of large capital funds which compel predetermination and comparison of costs and service values. Only the engineer has the specialized knowledge necessary to the making of such computations. In the United States special circumstances favored this extension of the scope of engineering. The creation of a national market by rapid construction of railroads after the Civil War created such a demand for new factories and equipments as to constitute essentially a second stage of the industrial revolution. The young engineering profession, experienced in emergency problems during the war, met the summons not only to design, construct and install the new industrial equipment but also to organize and supervise what was essentially a new system of factory operation. Thus was generated the management movement and its identification with engineering.

Another important characteristic of modern engineering is its specialization as a profession and the further specialization within the profession. As a rule the earlier engineers even as late as the end of the nineteenth century were also owners, organizers and operators of enterprises. Many of their discoveries and inventions were by-products of efforts to solve operating problems. As the demand upon the engineering function increased, however, specialization in engineering as a research, teaching or service career began. Following military and civil engineering, which trace their ancestry back into the premodern period, came mechanical, mining and metallurgical, chemical and electrical engineering. More recently other special fields have been differentiated, as is indicated by the following suggestive list of identifying prefixes: aeronautical, agricultural, architectural, bridge, construction, forest, gas, highway, hydraulic, irrigation, management, marine, naval, railroad, radio, sanitary, transportation. With respect both to training and professional service, specialization is greater in the United States than in Europe, which adheres more closely to the concept of the unity of all engineering and where the members of the profession are more broadly trained. This difference is undoubtedly due to the influence of the economic environment; the demand for engineering service in the United States has been

so great as to permit the gaining of professional livelihoods within narrowly specialized fields.

As a profession engineering has achieved a status comparable to that of law and medicine. It deals with concrete affairs; it has a body of organized, recorded knowledge and a procedure which is continually enriched by research and experience, of which the mastery requires special study and practise; it has concepts of good professional conduct and formulates regulations for their protection; and its application of professional skill is increasingly influenced by motives of public service. In nearly every country an individual must meet qualifications imposed by the government before he can offer himself to the public as an engineer. This professional status is further expressed through the numerous engineering associations which have been organized in every country of advanced culture and in all the major branches of engineering.

Schools of engineering are relatively less numerous in Europe than in the United States, but the average quality of their instruction is higher with respect both to the theoretical basis of professional knowledge and to the relation of engineering to social life. This difference, as in other fields of higher education, may be attributed in part to European superiority in preparatory training. In contrast the American schools lay greater emphasis on laboratory, field and shop experience and produce practitioners of exceptional ingenuity and adaptability in meeting practical problems. With respect to specialized research there is little if any difference. The curricula of American schools have been justly criticized as too narrow, but in recent years there has been a tendency to broaden them by the inclusion of courses on such subjects as the principles of economics and industrial organization. The fact that the majority of graduates of American engineering schools pursue strictly professional work for only a short time and gradually become business and operating executives concerned with problems of economic and other public policy has stimulated them to demand a broadening of engineering curricula.

Engineering associations are perhaps fully as important as an educational force and compensate in large measure for the narrowness of the curricula of the schools. They bring engineers under the influence of what is essentially a system of adult education which has not only the highest quality of technical content but a gradually increasing breadth as well. The influence of these associations in raising the standards of pro-

fessional conduct has been great. The early engineers were at the same time business men and too frequently their standards of conduct were colored by those of the market place. All the major engineering societies now have their codes of professional conduct and committees which constitute essentially courts of inquiry into conduct concerning which there may be complaint. These codes, which are usually brief and have a general rather than a definitely prescriptive force, regulate principally the relations of engineers among themselves, with owners, with contractors and subcontractors and with the public.

The economic status of modern engineers is anomalous for the reason that so large a proportion of graduates of engineering schools, belonging by academic label and legal status to the profession, are salaried employees in industry and not professional practitioners. Generally engineering as an economic function and as a profession is held in the highest esteem as an essential cog in the economic system, and great engineering experts and administrative executives receive large fees comparable to those of great lawyers and physicians. Professional fees are usually a sliding scale percentage of the cost of the engineering work done, and the different standard scales of percentage are applied according to the inclusiveness of the engineering service. On the other hand, the rank and file, the less ambitious or less gifted employees of public and private organizations working for specific annual salaries, receive incomes comparable to those received by other routine workers. A survey made by the Engineering Council in 1919 (in American Institute of Electrical Engineers, *Journal*, vol. xxxix, 1920, p. 182-88) indicated that salaries of engineers in public civil institutional service varied from an average of \$5867 for chief administrative engineers to \$1719 for those on general duty and \$975 for non-professional aids. As somewhat of an offset to these moderate incomes industry's dependence upon engineering has been so great that the young engineer has had reasonable expectation, under average economic conditions, of immediate and continuous employment.

The economic problems created by the rapid development of modern engineering challenge the ingenuity of students and administrators of human affairs. Engineering has created for individualistic enterprise a tool which has multiplied many times the latter's powers and achievements and yet threatens to become too complicated for such enterprise to use without social

confusion. Until the opening of the present century the commerce and industry of the world were dominated by the economics of physical frontiers of exploration, appropriation and exploitation. Under such conditions individualism was presumably the natural and effective form of organization for enterprise. In the absence of accumulated capital for investment in huge power mechanisms and in the absence of the engineering to create such mechanisms economic progress had to be on the whole the sum of individual physical efforts and progress.

During the past half century, however, the very richness of the resources of these frontiers yielded an income which permitted savings and their investment in improved mechanisms and which called modern engineering into existence. The impact of this engineering transformed industry and commerce into a system of large scale production and world wide interrelationships. The increase in the productivity of industry has been continuous and accelerating; from 1899 to 1927 in the United States alone physical production increased 180 percent, the number of wage earners 87 percent, the primary power per wage earner about 100 percent and the productivity per wage earner about 55 percent. These are indications of the material results of modern engineering.

There have been, however, other results which although less measurable are more disconcerting. One reason for this productivity has been increasing specialization and division of labor between commerce and industry, between the provision of capital and the direction of the use of capital goods, between ownership and management and among enterprisers and wage earners. This in itself has established a complexity of delicately adjusted relationships—a huge social mechanism with precisely related parts susceptible to maladjustment throughout if any important part fails in functional performance. A second cause or risk of maladjustment has resulted from the specialization of capital in fixed forms, some of them huge and costly mechanisms, which are subject to the destruction of their values through technical or economic obsolescence. Finally, as a third factor increasing susceptibility to maladjustment, the contractual relations of specialized participants in the operation of this huge economic mechanism have come to be formulated less in terms of physical goods and more in terms of estimated money valuations and profits, many of them forecast for long periods in advance.

Under the regime of modern engineering, industry has experienced a succession of periodic maladjustments which have resulted in a degree of stoppage of economic processing sufficient in each instance to jeopardize the continued existence of many enterprises and the livelihood of many participants. There is growing opinion that these maladjustments are a consequence of the inability of individualistic business enterprise, with its attention focused on values and profits, to manage a complicated, technical social machine which requires that attention be focused on the planned adjustment and manipulation of that machine to meet qualitatively and quantitatively measured variable demands for commodities. Although these maladjustments have been induced by the creative work of engineers, the onus of the problem does not rest primarily upon them, who have been scientific and professional, creating what enterprise has desired, but upon the enterprisers in commerce and industry who have called upon engineering to create the mechanism and upon that social statesmanship which has encouraged such enterprising.

The broader social consequences of modern engineering call for brief attention. Because it has made possible wider distribution of wealth and created innumerable specific commodities and services for the satisfaction of human impulses, life has become more democratic and richer in the variety of its activities and enjoyments. Power production and transportation have permitted more abundant and varied foods and articles of dress among all classes; the telegraph, telephone and radio have eliminated distance in communication and together with the power printing press and the cinematograph have given peoples of formerly diverse customs and habits intimate knowledge of each other; the railroad, steamship, airplane and automobile have vastly reduced isolation; opportunities for the satisfaction of play and other social impulses have been immeasurably increased. Such rapid changes in the material basis of life have been largely responsible for the transformation of ancient moral codes and forms of social organization.

There is evidence that modern engineering is becoming conscious of these problems and is beginning to assume some responsibility for the proper social use of the mechanisms which it has created. The beginning of this tendency may be traced back fifty years to the work of Frederick W. Taylor, the engineer who originally applied inductive science, or, more specifically, the basic

principles of engineering, to factory management. This idea involved research into the problems of operation, standardization of facilities and methods, measurement of forces and their results and control of operations in accordance with designed objectives and programs. During the half century since Taylor this technique of management has been developed and applied successively to the unit work place, the shop as a group of unit work places, the entire production department, the sales department, the coordination of production and sales and to the individual enterprise as a whole. Today enterprises consisting of a score of geographically scattered plants are managed, in so far as internal operations and relations are concerned, as effectively as the small factory of a half century ago.

This contribution of engineering to management has been in the service of individual, competitive enterprises. It has not yet been extended to embrace the problem of society's management of enterprise conceived as an organic whole. Broadly speaking the engineer has been indifferent to social problems; he has been concerned with the technical efficiency of his mechanisms rather than with their social consequences. He has also not been entirely a free economic being; he has been too individualistic and competitive within the profession, and the relations with industry which he has permitted to develop have tended to make him a servant rather than a master of enterprise. It has taken him over a generation to appreciate the situation pointed out by Thorstein Veblen—his potential power and social responsibility in the service of business enterprise.

Since the World War, perhaps as a result of a greater consciousness of professional power and a new social outlook derived from that experience, the engineer has been turning attention to the social problems which his work has generated. He asserts today that it is he who must solve the problem of economic maladjustment. The principal economic surveys in the United States since the war have been made under the auspices of and largely by engineers. The President's Conference on Unemployment in 1921 was conceived, organized and directed by an engineer, and as an outgrowth of it three national surveys were set up to "enlarge the general understanding of our economic system and to stimulate the continuing reduction of unemployment": the first, a study of business cycles and unemployment; the second, a study of seasonal operations in the construction industry; and the

third, a survey of recent economic changes. These applications of fact finding, the basic factor in the technique of engineering, have yielded useful data. The question remains whether engineering as a profession will take the next step and apply to the social problem the basic factor of design. Will it design for industry as an organic whole the same technique of organization and management that it has made so effective in individual enterprise?

Undoubtedly, by compulsion of economic circumstances this will eventually be done, but probably not by engineering as an organized profession. Individual engineers will of course take an important and constructive part, but as an organized profession they appear to be too closely tied, because of the particular types of business enterprise with which they have made the closest connection, to the a priori concept of individualistic enterprise. As a group they may not be able to overcome this inhibition; but engineering as a technique has passed beyond the sole possession of the engineer and is now available to the economist, to other social scientists, to the owners and managers of industry and to other men of affairs. The greatest experiment in social engineering that has ever been attempted, that of designing and constructing an integrated economy in the Union of Socialist Soviet Republics, was conceived and is being engineered by others than professional engineers, although the latter play a major part in the detailed work.

ENLIGHTENMENT. "Enlightenment is the liberation of man from his self-caused state of minority. Minority is the incapacity of using one's understanding without the direction of another. This state of minority is self-caused when its source lies not in a lack of understanding, but in a lack of determination and courage to use it without the assistance of another. *Sapere aude!* Dare to use your own understanding! is thus the motto of Enlightenment." This famous passage from Kant's *Beantwortung der Frage: Was ist Aufklärung?* (1784) characterizes most clearly the decisive intellectual tendency as well as the historical character and mission of the philosophy of enlightenment. To the view of the world which derived its strength from a belief in divine revelation and which was mainly supported by the powers of authority and tradition enlightenment opposed another which rested on reason and the powers of the understanding. The basic idea underlying all the tendencies of enlightenment was the conviction that human understanding is capable, by its own power and without any recourse to supernatural assistance, of comprehending the system of the world and that this new way of understanding the world will lead to a new way of mastering it. Enlightenment sought to gain universal recognition for this principle in the natural and intellectual sciences, in physics and ethics, in the philosophies of religion, history, law and politics.

Historically speaking, one understands by enlightenment primarily the development undergone by this principle during the seventeenth and eighteenth centuries in England, France and Germany. But although the main ideas of enlightenment reached their complete development and their final victory in the intellectual movement of these two centuries, their roots lie deeper in the past. The enlightenment represented only the continuation and consistent development of certain tendencies in the European mind, the origin of which can be traced back to the fifteenth and sixteenth centuries, the centuries of the Renaissance. Here on the threshold of modern times in the great clash of Middle Ages and Renaissance the problems and questions, of which the Enlightenment attempted the solution, were first seen and raised. It is its chief merit that it did not raise these questions separately but arranged them around a single center.

In the realm of nature it represents the starting point of modern natural science. Modern natural science, as it was founded in the seventeenth century by Galileo and Kepler, is based

on the presupposition that nature is a closed system of causes and effects, of reasons and implications. The axiom of sufficient reason as Leibnitz formulated it represents its methodological starting point. According to this there is nothing accidental or arbitrary in nature; everything in it is ruled by universal and necessary laws. But these laws are not derivable from mere experience, i.e. immediate sense perception. Experience presents events of an infinite complexity which at first sight completely confuse the understanding and can be neither comprehended nor conceived by it. In order to achieve such a comprehension, the *interpretatio naturae* of Bacon, it is necessary to disentangle the manifold threads interwoven in every individual event. It is a conceptual analysis of natural phenomena rather than their immediate observation which supplies an insight into the laws of nature. Galileo reached his first decisive results by such a method of analysis. He maintained that all natural knowledge must go a twofold way: the way of the "resolutive" and that of the "compositive" method, the way of "analysis" and of "synthesis." Natural knowledge reduces every complex event to its simple conditions—and the truth of the hypothesis by which these conditions were assumed must be tested by its success in reconstructing from them the real event as observed in nature. The stone which is thrown travels along a complicated path which is incomprehensible to the observation of the senses, but scientific thought reduces it to two elementary conditions: the force of the original impulse, preserved according to the law of inertia; and the force of gravity, which at each separate instant affects the moving body according to a simple law. The path is thus determined as being a relatively simple geometrical form, a parabola. This reduction of natural events to mathematical theory was confirmed and enlarged by Descartes' discovery of analytical geometry, Leibnitz' analysis of the infinite and Newton's calculus of fluxions.

The next step of enlightenment necessarily consisted in introducing the principle established in the realm of nature into the realm of social and historical fact. Here too it is insufficient to remain satisfied with the simple existence of facts as they present themselves in morals and customs, in political structure and social behavior, in codes of law and articles of religious faith. Instead of being accepted on faith their origin must be discovered and their cause proved valid by the criteria of reason otherwise the existing institution can expect no recognition. It was the

common presupposition of all thinkers of the Enlightenment that the being of man is implied in and subordinated to the being of nature and that it must accordingly be explained by the same universal laws. The world of man, as Spinoza says, may no longer form "a state within the state"; it may not demand an exceptional place within the cosmos of knowledge. For the stirrings and movements of the will on which the world of man is founded are subject to rules just as universal as the movements within the world of physical bodies. There is a mechanics of human inclinations and urges, of passions and emotions, as there is a mechanics of celestial bodies. This analogy was emphasized so severely by the philosophy of the Enlightenment that it became finally a complete logical identity.

It was already a predominant trait of mediaeval political and social theory to conceive of the whole of society as a "social body." But the idea was then founded upon a purely spiritual view. Humanity appeared as a unified state, created and dominated by God, expressing itself in the two institutions of universal monarchy and universal church. Humanity was a *corpus mysticum* at whose head stood God and Christ. This spiritual foundation of state and society was gradually replaced from the beginning of the seventeenth century by a purely materialistic one. It found its most radical protagonist in Hobbes, who in his philosophy of the state explicitly refers to Galileo as his model in method. He starts with the presupposition that the concept of body is the common term which includes and unites both nature and society. The term body in its most general meaning denotes, according to Hobbes' definition, anything which may be divided into parts and composed from them. It is only by means of this separation and reintegration that one is able to understand the essence of any body, whether physical or social. These presuppositions determine the method which Hobbes and the other political and social theorists of the Enlightenment followed. They considered all political and social being as a sum of effects which must be dissolved and reduced to its simple elements in order to be understood. The collective will of the state is the product of the individual wills. Accordingly, the fundamental problem of political philosophy consists in discovering the procedure by which those wills, which are confined exclusively to their own interests and which originally are the only ones given, should combine to form a cooperative body.

In solving this problem the philosophy of enlightenment continuously refers to the ancient theory of contract by natural law. Society and state originate in the act of individuals who on the basis of an original contract enter into a relationship of mutual obligation and impose upon one another certain restrictions of the will. The content of this original contract is interpreted differently by the various thinkers of the Enlightenment, but the idea of contract remains as a common and dominating method. Only the individual can be considered a true "person" and the true and original subject of law, whereas the state and all social organizations possess only an artificial personality (*persona artificialis*). This *persona civilis* or *persona moralis* is not an independent entity; it is merely the name and the shortened formula for a legal relationship. All social organization, all *consociatio*, is based on the explicit or silent consent of the associates; it originates in restrictions accepted voluntarily by individuals. Even the sovereign rights of the state are merely a product of the voluntary sacrifice and socialization of such individual rights (Althusius). The organic conception of the state which was predominant in the mediaeval theory is thus replaced by a mechanical one.

The fundamental principle of the Enlightenment is here preserved primarily by the fact that any purely theocratical theory of the state or of society is rejected; the postulates are throughout those of "natural reason." The political theory of Johannes Althusius has proved in this connection to be of epochal significance. His *Politica methodice digesta* (1603), although expressive of a strong religious conviction (Althusius was a thorough Calvinist), refuses to seek the foundations of political theory in religion or belief in revelation and deduces by a strictly rational procedure a purely secular conception of society. An independent and unified system of politics is to be derived from a limited number of axioms intelligible by pure reason—just as in mathematics the totality of theorems follows from the system of axioms and definitions. Divine Being and the Divine Will are therefore not referred to in the foundation of political and social theory; they are retained by certain theorists merely as their crowning point. In Germany this tendency of Althusius is accepted and carried on mainly by Samuel Pufendorf and Christian Wolff.

In the development of the theory of natural rights the distinction between social contract and contract of sovereignty plays a decisive role. By social contract (*pactum societatis*, *contrat so-*

cial) is understood that act by which individuals originally united and by virtue of which they transcended the mere "state of nature." By virtue of this pact the individuals, the *singuli*, are transformed into a real *universitas*: thus originates the common will, which being established by free consent (*consensus*) of the individuals has also the power of obligating them to carry out certain actions. The contract of subjection (*pactum subjectionis*) was distinguished from this social contract; it was the pact by which the community transfers to a sovereign certain rights originally derived from the social contract.

The theorists of absolutism consider this transfer unconditional and irrevocable. Thus Bodin and Hobbes declare that any division or restriction of a ruler's sovereignty is logically self-contradictory. The right of sovereignty can be transferred either totally or not at all; it cannot be divided or limited by any reservations, whether ethical or religious. For Hobbes the right of the state, being concentrated in the ruler, is therefore a "right to all" (*jus ad omnia*). The ruler is the "mortal god" who controls completely the property and life, even the opinion and religion, of his subjects. In order to derive these extreme conclusions Hobbes is obliged to alter essentially the outlines of the contract theory. He denies the dualism of social contract and contract of sovereignty; he knows of only one undivided act by the power of which individuals oblige one another to resign all separate rights and to transfer them in their totality to the ruler. Thus for him society does not exist as a legal and competent subject which as such submits to a ruler; rather the act of submission unites into a social whole the individuals who until then were nothing but a mere aggregate of wills. The contract of submission is unalterable, since its alteration would imply a return to the state of nature, to the "war of all against all." The people possess their *universitas* only in the king; without him they are a chaotic heap of volitions contradicting and excluding one another.

Exactly the opposite conclusion was reached by Althusius, who retained the duality of the contracts and worked out their essential difference. This point of view led necessarily to the doctrine of the sovereignty of the people. Althusius teaches that the social contract must necessarily precede the contract of submission, since only a community preexisting as a legal subject could enter a legal obligation. It follows that such an obligation can never be absolute but must take place under certain reservations. The people

do not give up their original majesty even if they voluntarily resign a part of it; for this resignation always concerns only the execution of power, not its legal possession. The people can as little deprive themselves of their genuine majesty to transfer it to the sovereign as one could resign one's soul and life to transfer them to another. The sovereign can be considered only the administrator of the popular will, whose function ceases as soon as he fulfils it improperly or as soon as it is taken away from him by a new act of majesty of the people. This applies to the monarchical constitution as well as to the aristocratic or democratic one, for the difference between these is not one of political form but merely one of administration and government.

This line of thought reaches its completion within the philosophy of the Enlightenment in Rousseau's doctrine of the *contrat social*. In stressing the conception of sovereignty Rousseau's doctrine agrees with those of Hobbes and Althusius. He too starts with the proposition that sovereignty by its very nature is indivisible and unlimited; that the individual in entering society transfers all his rights unreservedly to it. In the relation of the social contract to the contract of sovereignty, however, Rousseau takes exactly the opposite view from that of Hobbes. He eliminates the contract of sovereignty altogether and declares the social contract to be the sole foundation of a political community. The only possible and legitimate source of community, the act by which a people first becomes a people, is the voluntary assent of the individuals to a common will (*volonté générale*). By this act all individual right ceases and is transferred to the whole. Nevertheless, society does not rule by mere force; for it is so organized that the individuals by submitting to it find the pure expression of their own being in its general laws. True freedom, according to Rousseau, consists not in the lack of restriction as such but in a certain form of restraint—in a law which is not imposed upon the will from the outside but which it rather establishes by itself and for itself. This fundamental idea of Rousseau's political theory was raised to general philosophical significance in Kant's theory of ethics. Concerning the details Rousseau maintains that the people as the bearer of the general will can be represented by individuals or by certain communities in the execution of this will, but that in thus choosing a representative it can never resign its fundamental rights. A mandate once conceded can be reclaimed at any time.

The mental attitude of the philosophy of the Enlightenment was of particular and decisive importance for the philosophy of law. In its derivation of law the philosophy of the Enlightenment goes back to the theory of natural rights. The positive law, which is based exclusively on custom (*Satzung*) and which can accordingly be altered or annihilated by mere custom, is subordinated to the totality of those legal precepts which are of necessary and immutable validity and are the same for all times and all individuals. They cannot be diminished by any subsequent obligations into which the legal subject might enter; they are absolutely inalienable. This doctrine of inalienable fundamental rights was systematically carried out in the Netherlands by Hugo Grotius, whose main work, *De jure belli ac pacis* (1625), belongs to the most prominent and fruitful achievements of the Enlightenment. Grotius develops the plan of a "universal jurisprudence" which comprises private as well as public right and which allows the total content of both to be reduced to fixed principles. These principles, according to him, are no less evident and necessary than the axioms of mathematics. The content of this "natural law" is so unconditionally valid that it is binding not only for man but "for all reasonable beings at large"; even God is not able to alter it, since it does not depend upon His will but is the pure expression of His essence, which as an eternal entity is incapable of transformation. "Just as even God, then, cannot cause that two times two should not make four, so He cannot cause that that which is intrinsically evil be not evil" (*De jure belli* . . . , I: 1, 10, 5).

These fundamental ideas entered into the German philosophy of the seventeenth and eighteenth centuries mainly through the mediation of Leibnitz and Christian Wolff, and here they quickly received universal recognition and further development. Leibnitz confronts the *jus strictum* with a higher law of purely spiritual origin—the law of reason and of reasonable beings. The privilege of the latter is that they are essentially free and that they cannot lose or alienate this freedom by any subsequent obligations of whatever nature. Christian Wolff developed this view completely and methodically in his theory of natural law. Wolff distinguishes between acquired rights (*jura contracta*) and innate rights (*jura connata*); among the latter he numbers particularly the right of personal security (*jus securitatis*). Every individual is entitled to the undisturbed performance of all those

actions which are indispensable for his physical preservation and mental perfection. This theoretical view of the Enlightenment received an eminent political significance by its effect on the Declaration of Independence in the United States and its reception as a model for the American constitution. According to Jellinek's work it seems certain that the American bills of rights, particularly the Declaration of Right of the Free State of Virginia (1776), decisively influenced the Declaration of the Rights of Man and of the Citizen of the French Constituent Assembly of 1789. The theory of natural rights as developed by the Enlightenment thus entered directly into the practical arrangements of politics and often determined the development of even their most individual traits (see Cassirer, E., *Die Idee der republikanischen Verfassung*, Hamburg 1929).

Just as in the theory of law the Enlightenment opposed the "unwritten" law to the "written" one, the pure law of reason to the "positive" law, so it sought to carry the same fundamental distinction into religion. According to it the kernel of religion is not to be found in single dogmas which are received by revelation and accepted on faith as they are handed down by tradition; religious truth, as any truth, rather deserves recognition only as it is founded on ultimate principles of reason. Thus the primacy of natural religion above the religion of revelation is constantly emphasized. In religion too the principle of mere authority and Scripture must be given up so that religion may be founded the more firmly on the nature of man, on his genuine innate faculties. This fundamental view of the Enlightenment was developed with clarity by Herbert of Cherbury as early as 1624 in his book *De veritate* and was accepted with increasing recognition by the "rational" theology of the eighteenth century. Religious truth, in so far as it is based on authority and revelation, possesses, according to Herbert of Cherbury, no more than presumptive value; and universal content of religious experience can be found only in the pure belief in God which is in no need of revelation but can be derived immediately from the essence of the mind and demonstrated by means of human understanding. The being of God as such cannot become the object of doubt but merely the more specific determinations of that being, the individual predicates which man attributes to divinity. This being is immediately evident to all reasonable minds in the order of nature, its inner lawfulness and teleology, and in the uni-

versal moral order, which is the same for all intellectual and volitional beings. In order to confirm this identity of morality Herbert refers to the stoic doctrine of the *consensus gentium*. Such a universal consent proves the descent of all individual volitional beings from a single divine origin, and it is upon this origin that all possibility of knowing the truth and all standards of truth depend. Moral self-certainty is thus considered the fundamental standard of religious truth; the use of conscience alone can lead to the objective certainty of God and a future life.

The pressure toward eliminating all merely accidental elements from the essential content of religion became connected in the Enlightenment with the idea of religious tolerance. This tolerance was not meant to be merely practical toleration; it was rather based on the idea of an ideal equivalency of all positive religions, since each contains the universal meaning of natural religion as the purely moral religion of reason. The individual religions differ from one another only with regard to the symbols by which they describe this meaning. This idea had been propounded during the Renaissance by Nicholas of Cusa ("Una est religio in rituum varietate") but in the philosophy of the Enlightenment it received its widest recognition. In strict analogy to Cusa's book *De pace fidei* (1490?) Jean Bodin in his *Colloquium heptaplomeres* (1588) introduces the disciples of seven different religions contending with one another and defending their respective views and shows that true religion is common to all. This idea is finally taken over in the parable of the ring in Lessing's *Nathan der Weise*. But Lessing adds to the general conception of the Enlightenment by subsuming the whole of religious development under the idea of "education" (*Erziehung des Menschengeschlechts*, 1780). According to this the various positive religions follow one another in such a way that they form the elements and phases of a unified plan of education by virtue of which humanity is led step by step from crude and primitive beginnings to the highest goal—the goal of "rational belief," morally clarified and finally dissolved into a purely moral idea.

Within the religious philosophy of enlightenment the attitude toward the problem of miracles is of particular importance. Most of the representatives of this philosophy do not altogether deny miracles but declare that they are not to be understood as a singular supernatural interference of divinity with the course of nature. The very fact of the universal and immu-

table lawfulness of the course of nature is itself the true test of divinity, proving the origin of the world in a supreme understanding. It is not the exception but the rule which ought to form the starting point of religious consciousness.

Der Wunder höchstes ist,
Dass uns die wahren, echten Wunder so
Alltäglich werden können, werden sollen

(Lessing, *Nathan der Weise*, I: 2). The universal miracle of moral and natural laws is the fundamental and sufficient revelation of divinity, and this universal miracle dissolves all particular ones and renders them superfluous. The human mind is itself the supreme miracle which comprises all others: "Tout est plein de miracles, mais des miracles de raison" (Leibnitz).

The development of religious enlightenment proceeded differently in various countries. In England the movement of rational theology began in the seventeenth century, represented in the Anglican church by John Hales and Chillingworth and in philosophy especially by the Cambridge Platonists—Whichcote, John Smith, Cudworth, Henry More. It was followed by the deists, or free thinkers—in England notably John Toland and Anthony Collins, in Germany Hermann Samuel Reimarus—who confined the content of religion to the belief in God and the recognition of certain fundamental moral truths. In the circle of the German theology of the eighteenth century the religious conviction of enlightenment was represented in strict adherence to the philosophical principles of Christian Wolff, by Semler, Jerusalem, J. J. Spalding and others. In France the religious enlightenment entered into general literature and received a predominantly polemical turn by giving the call to arms, in the name of reason, against tradition and superstition, against dogmatism and clerical fanaticism. Here Voltaire became the real leader and protagonist of the Enlightenment. The most impressive cultural document of the Enlightenment and at the same time the most effective in propagating its ideas was the *Encyclopédie* of Diderot and d'Alembert. The whole development reached its philosophical culmination in Kant, who in *Die Religion innerhalb der Grenzen der blossen Vernunft* (1793) defined the range and limits of natural religion by almost completely reducing the latter to a moral consciousness.

The attempt of the Enlightenment to reduce the total content of religious experience to that of moral experience presupposed that the latter was previously self-contained and complete within its own realm. Unless ethical standards

were certain they could not be made the foundation of religion. Thus the Enlightenment came more and more to set forth the self-sufficiency (*autarkeia*) of morality as its fundamental postulate. It derives the ideal of self-sufficiency from ancient ethics, elements of stoic philosophy having contributed from the beginning to its formation. This development too can be traced back to the beginnings of the Renaissance. Pietro Pomponazzi's *De immortalitate animae* (1516) represents one of the earliest attempts of modern thought to emancipate ethics from the despotism of religious metaphysics. The decision of religious and dogmatic problems, it is here argued, is irrelevant to the truth and certainty of morals, for these possess their center of gravity in themselves. Good carries its own reward, evil its own punishment. In Pierre Charon's *De la sagesse* (1601) this idea is made more explicit. Here the ideal of a purely "natural" morality (*prud'homie*) is developed in such a way that it is based upon internal compulsion and is no longer in need of authoritative or religious support. This morality is always constant, never deriving its rule of action from changing circumstances, never relying upon promise or threat. "I consider the words: 'Were I not a Christian, were there no God and no eternal damnation to be feared, I should do this or that,' as disgusting and terrible. I demand that you be honest because nature and reason,—that is, God—demand it, because the general order and constitution of the world, of which you are a part, require it—an order against which you cannot rebel without denying your own being and without fighting against your own purpose; as to the rest, may there come what will" (*De la sagesse*, bk. II, ch. v). In this passage is the fundamental theme which is developed in a series of variations in the ethics of the Enlightenment. Grotius explicitly distinguishes the natural derivation of ethics from the religious one. The propositions of natural right do not depend in their validity upon religious presuppositions: they would retain their meaning and their certainty even if there were no God. In Germany, Lessing fought for this principle of ethical autonomy even before it received its strictly systematic foundation in Kant's *Critique of Practical Reason*.

ENSENADA, MARQUÉS DE LA, ZENON DE SOMODEVILLA (1702-81), Spanish economist and statesman. After holding various positions in the Ministry of the Marine he was made Marqués de la Ensenada in 1736. He became minister of finance, war, marine and the Indies in 1743 and continued his control of the government of Spain after the accession of Ferdinand VI.

Ensenada accomplished significant reforms and projected others which were partially carried out after his death. By reorganizing the fiscal administration and reducing the concessions to tax farmers he increased the net revenue of the state while alleviating the actual burden of taxation. The poverty and depopulation of Spain he attributed to the antiquated and complex system of indirect taxation, and the great object of his fiscal policy was to substitute for the numerous small taxes the *única contribución*, apportioned according to an exhaustive survey of the wealth of the realm. Although he insisted that the government's credit was dependent upon its good faith he nevertheless adhered to the pernicious doctrine that the government was not bound to honor the obligations contracted by Ferdinand's predecessors and suggested that the entire question be relegated to theologians for settlement.

Ensenada supported the unpopular view that the precious metals were merchandise but argued that Spanish industries should be subsidized and the export of capital controlled to prevent foreigners from taking gold from Spain. He sanctioned the century old policy of excluding foreigners from trade with the Spanish colonies but advocated opening up this trade to all Spanish ports, as was done by Charles III in 1778, and he helped to destroy the monopoly of the colonial trade by sending out independent ships. The prosperity of Spain was increased also by Ensenada's policy of promoting internal trade. This he effected by improving roads, building canals and abolishing the provincial customs dues on grain.

Ensenada's fiscal reforms were intended to release a greater part of the state's revenue for the expansion of the army and navy. He advised the king to pursue peace in order that the population, depleted by continuous wars, might increase. Preparedness he held to be the surest guaranty of peace, and in accordance with this theory he greatly improved the Spanish navy. While considering the gains Spain might make as the price of neutrality during war between England and France he would have joined either side to regain Spanish dominions usurped by the other. Ultimately he favored an alliance with France; this policy aroused English enmity, which supported by the opposition of the Anglophiles in Madrid resulted in his dismissal in 1754. Although Ensenada was allowed to return to court in 1760 he never regained his former power and was again banished from the court in 1766.

The memorials which Ensenada prepared for the king are published in Rodriguez Villa's biography.

ROBERT S. SMITH

ENTAIL, or fee tail (*feodum talliatum*), signifies a proprietary interest which has been cut down and appreciably curtailed by restraining alienation on the part of the donee in order to defeat the expectant interest of the issue specified in the gift or the reversion of the grantor. The term finds an equivalent in the fideicommissum, or family trust entail, of the modern civil law. The concept was shaped in part by a superficial consideration of the ancient fideicommissum of Roman law, which actually was a trust imposed upon the heir or legatee in order to pass the

inheritance or legacy to a third person, who was regarded as the real owner. The device gained recognition in Roman law as a means of evading the numerous formalities surrounding the institution of heirs and the creation of legacies and also to circumvent the disabilities imposed upon certain classes who were ordinarily incapable of inheriting; and it consequently differed in both character and purpose from the modern forms of entail in continental and English law.

The modern entail is a feudal idea grafted on the Roman jurisprudence and called forth by a desire to prevent the disintegration of large landed estates through divisible inheritance or the ineptitude, extravagance and irresponsibility of heirs. Thus, among the higher feudal aristocracy of mediaeval German states, it was recognized by the latter half of the thirteenth century that partition of the family possessions could be prevented only by the substitution and development of a fixed law of primogeniture and through dynastic statutes or customary practise of a special law of entailed estates (*Stammgüter*, *bona aviatica*, *stemmatica*), family holdings which are inalienable and are inherited agnatically and in accordance with primogeniture. Whether the ownership of the entailed property rests with the family as a corporate association with its own legal personality—a view of the majority of the Germanists—or whether the ownership is attributable to the head of the house, who is restricted by the special end to which the family estate is appointed and by the real rights in expectancy held by the agnate members, is a moot problem of the civil law.

The lower nobility, which had no powers of private legislation, endeavored to accomplish its ends by consensual agreement and entails. Such entails were found in Germany from the eleventh century onward and considerably earlier among the Anglo-Saxons; but they first became widespread in the sixteenth century. After the Thirty Years' War they were recognized as the most effective means of preserving the family estates from the disintegration to which they were doomed by the Roman law of inheritance. The lesser nobility, following the example of the Spaniards and Italians, combined the Roman fideicommissum with certain ideas of the feudal law, particularly that of a *successio ex pacto et providentia maiorum*. Philipp Knipschild's *Tractatus de fidei-commissis familiarum nobilium* (1654) determined the actual theory of the family entails down to modern times and became the basis of both the common law

and the legislation of the different German states. The fideicommissum could be created by a declaration of the donor's will, given either *inter vivos* or *mortis causa*. It established an inalienable estate, the temporary occupant of which had the right of possession, management and usufruct, and the other members of the family an irrevocable real right in expectancy. In the family trust entail, if the donor did not appoint the order of succession, the statutory rule applied. This rule embodied the principle of *majorat* in a broad sense, whereby succession might fall to the oldest member of the entire family irrespective of the line or degree of kinship or to the nearest kinsman of the last occupant capable of inheriting according to the degree of kinship or according to the rule of primogeniture by which the nearer parentelic group preceded the more remote and the elder line preceded the younger within each group.

The family entails followed the same lines of development in mediaeval France and among the Italian monarchies. In the latter the older nobility were spurred on by contempt for and hostility to the newer nobility. To preserve the unity of their family estates they formed societies (*consozi*) governed by agreements such as the fideicommissa, which rendered the patrimony inalienable and indivisible for generations. By the end of the seventeenth century the greater part of the landed property was thus entailed.

In England by the beginning of the thirteenth century gifts expressly limited to a donee "and the heirs of his body" or to a husband and wife "and the heirs of their body" appeared with increasing frequency just at the time when the man who held "to himself and his heirs" was gaining a full liberty of alienation, both as against his lord and as against his apparent or presumptive heir. By the middle of the century these gifts were curiously interpreted as conditional fees and the grants as conveyances to the donee upon condition that he should have heirs of his body. Once the condition was satisfied by the birth of an heir, the donee had the power of complete alienation. This judicial construction can be explained only on the ground of a strong bias in favor of free alienation. Since this doctrine ran counter to the expressed intention of settlers, an act of 1285, the first chapter of the Statute of Westminster 2, the famous *De donis conditionalibus*, converted conditional fees into fees tail. Originally the duration of the entail was restricted, but the courts by a piece of judicial legislation shortly after the passage of the

act restrained alienation to the fourth generation (*Belyng v. Anon.*, Selden Society Publications, vol. xxxi, London 1915, p. 176) and gradually made the entail perpetual.

The disadvantages of the entail were soon evident both in England and on the continent. With the expansion of commerce creditors found that entailed property could not be attached for the payment of debts. Agriculturists maintained that as holders of entailed estates had no permanent interest in improving the land they prevented progress in cultivation; at the same time a drastic displacement of the small peasant holdings was being brought about. Kings were disturbed because in forfeitures of estates for treason they were deprived of more than a life interest. In civil law countries it was felt that by means of the entail a new form of succession was being substituted for the ordinary one. The secrecy of the entail on the continent was a target for critics, since by this means the possessor of an encumbered estate was enabled to pass for the absolute owner and enjoy a fictitious credit. Continental countries resorted largely to statutory enactment in attacking the entail; England effected reforms by judicial legislation.

Under the old regime in France certain modifications were introduced. Sixteenth century ordinances limited entails to two degrees, not including the first holder, and provided for publicity. These provisions, brought together in the Ordinance of August, 1747, were not effectively carried out. The *encyclopédistes* resumed the attack and out of hatred for all feudal institutions entails were abolished in the course of the revolution on November 14, 1792, and were prohibited on principle by the *Code civil* (art. 896). A Napoleonic decree, however, conferred upon the new nobility perpetual entails; and an attempt was made during the restoration regime of Charles x to reintroduce primogeniture by a law of May 17, 1826, which, however, was repealed in 1849. In modern Germany the entail also encountered violent opposition. During the supremacy of French law in the regions west of the Rhine the institution completely disappeared, and the French example was soon followed in other German states only to be overthrown when the entail was reestablished in the first period of reaction following 1815. The entail was again under fire in 1848; it was actually abolished in some states—notably Prussia by article 40 of its constitution—but it was restored in the reaction that soon followed. With the sole exception of a few states in west-

ern Germany it was preserved through the World War. After the war the national convention embodied in the new constitution of 1919 a general clause declaring that entailments were to be dissolved (art. 155 of the Weimar constitution). In pursuance thereof most of the German states in the following years enacted statutes providing for either the immediate or gradual dissolution of entails. In the post-war period liberalizing enactments in southeastern Europe, such as the work of the Yugoslavian convention which drafted the constitution of 1921 and abolished entails (art. 38), were counteracted by reactions like that of Rumania, where alienation and subdivisions of the land of the peasants have been restricted within definite limits in order to avoid undesirable effects resulting from equality under the civil code. Eighteenth and nineteenth century legislation in the Italian states severely curtailed the institution, denying in a number of states the right to create fideicommissa to all save the nobility and forbidding perpetual entails, the property becoming free again after a certain number of transfers—four according to Piedmontese laws, for example, two according to enactments of Maria Theresa. The abolition of entails in Italy during the French Revolution was temporary; the fideicommissum in restricted form returned to favor only to be abolished in every form in the modern code (art. 899).

In England objections to the estate tail resulted in the judicial sanction in 1472 of a method of evading the effect of the statute *De donis* by means of a fictitious suit known as a common recovery, which barred both the entail and the donor. After the doctrine had been established that an estate tail could be transformed into a fee simple by a common recovery, a somewhat similar effect was given by statute to the levying of a fine. The difference was that a common recovery barred both the entail and the donor, whereas a fine barred only the entail. The alienability of the entail called forth in the sixteenth century new devices to preserve the large domains of the aristocracy intact. By means of elaborate methods, known to lawyers as contingent remainders, shifting and springing uses, executory devises and powers of appointment, it became possible so to settle property that it must for an indefinite period continue to be enjoyed by a series of limited owners, no one of whom had complete powers of alienation. These family settlements aimed at the restoration of the old unbarrable entails; but the courts, zealous in their adherence to the principle of

freedom of alienation, were compelled to lay down rules to prevent what the lawyers of the sixteenth century called "perpetuities." In the seventeenth century the courts sought to prevent the remoteness of time at which a future interest was made to vest. In the Duke of Norfolk's Case in 1681 Lord Nottingham in the Court of Chancery laid down the general rule which is now known as the modern rule against perpetuities, according to which, as finally settled, any interest which must vest within a life or lives in being and twenty-one years thereafter is valid; any interest which may vest at a period more remote is invalid.

Among the sweeping legal reforms effected by Parliament in the nineteenth century a statute in 1833 abolished fines and recoveries and enabled the tenant in tail to alienate his lands by deed. The Law of Property Act of 1925 permits the tenant to dispose of his estate by will as if he had disentailed. Otherwise entails remain untouched, and they are permitted to include personalty as well as realty. While descent to the heir-at-law has been abolished, entailed interests are not affected but descend according to the general rule of descent prevailing before 1926 (Law of Property Act, 1925, 15 Geo. v, c. 20, sect. 130, subd. 1 and 4 and Administration of Estates Act, 1925, 15 Geo. v, c. 23, sect. 51, subd. 4).

In Scotland the institution of entails in its complete form was not introduced until the seventeenth century, and it was finally authorized by a statute in 1685. Objections similar to those raised in other lands brought about restrictive legislation in the eighteenth and nineteenth centuries, and a statute in 1848 aimed to approximate the English law of entail as nearly in substantive effect as the difference in forms of conveyancing in the two countries would admit and allowed the tenant in many cases to acquire the estate in fee simple by executing an instrument of disentail. Successive statutes have continuously enlarged the rights of tenants in tail, and the Entail Act of 1914 finally prohibited the creation of fresh entails (4 & 5 Geo. 5, c. 43).

The American experience dates from the colonial era, when the practise of entailing land was extensive; it steadily increased in the eighteenth century. It was most common in the manorial and plantation systems of the middle and southern colonies. Just as primogeniture proved inapplicable to American conditions, so the attempt to restrict alienation was very early found adverse to colonial interests. The opposition to both sprang from the feeling that they would

nurture and perpetuate an undesirable social and political class. In Georgia the colonists appealed to the trustees to abandon their policy of making entailed grants on the ground that it was ruinous to the colony, and after much controversy the Common Council in 1750 enlarged all grants already made to absolute inheritances. The common recovery was frequently suffered, but in some colonies, such as Virginia, statutes forbade the use of the fine; and common recovery and private legislative action were necessary to release an estate from an entail. This type of relief although expensive, elaborate and at times dilatory was generally preferred to resort to the courts. As a result of the unfavorable colonial experience the legal profession by the close of the colonial period was inclined to look with disfavor upon the institution of the fee tail. The legislation in Virginia, culminating in 1776 in Jefferson's successful attempt to abolish entails and supplant "an aristocracy of wealth" by an "aristocracy of virtue and talent," is typical of this changing attitude. It is estimated that this act released from entail at least half and possibly three fourths of the entire "seated" area of the state. The confiscation of the great loyalist estates during and after the War of Independence brought about the subdivision of vast entailed estates, among them the properties of Sir William Pepperrell in Maine, the Philipse estate in New York and the estate of the Penn family, proprietaries of Pennsylvania. In the great majority of American states, in emulation of Virginia, there is legislation aimed at the abolition of entails. Today the entail is possible although rare. Its elimination has been brought about roughly in three ways. In some states the fee tail has been made a fee simple in the first taker. In others the entail has been preserved merely for the life of the donee in tail or has been made a life estate in the first donee with remainder in fee simple either to the latter's children or the person to whom at common law the estate would pass at his death. In a third group the fee tail subsists, but the tenant is permitted to convey the property in fee simple, usually by ordinary deed. Such statutes do not abolish entails, and today in Massachusetts and Maine in the event of the failure of the tenant in tail to convey in fee simple the land descends according to the common law rule of primogeniture.

ENTICEMENT OF EMPLOYEES. The concept of the enticement of labor is based upon an interest of lord, master or employer in his servants or employees and describes an interference with the relationship existing between them. That interference may arise between employers competing for help, and in such a case is usually acute in times of labor shortage, e.g. war or pestilence; it may arise between industries, as, for instance, between the essential and non-essential industries during the World War; between employers competing for a worker possessed of unique ability; between employers and employees, when employees unite and seek to entice their fellow employees from employment unless conditions be changed in accordance with their demand. Prevalent throughout is the notion of scarcity of labor as to quantity or kind. At various times, when scarcity has become evident, employers have sought to protect their interests through legislation, the action of the courts and social pressure.

Prior to the Statute of Labourers, which was the first general enactment prohibiting entice-

ment, there had been no common law action for procuring a servant to leave the master's service (*Year Book*, 11 Henry IV, f. 23, pl. 46). There had been an *actio indirecta* arising in favor of the lord for violence done household servants and slaves, in so far as it was to the lord's interest not to be deprived of their services thereby (Bracton, f. 115).

In 1349, following the visitations of the Black Death and the consequent decimation of the population, there was great difficulty in getting laborers, and those that remained were exacting high wages. Since Parliament was afraid to convene during the pestilence, the king issued an ordinance [Ordinance of Labourers, 23 Edw. III, c. 2 (1349)] providing among other things that no laborer should depart from his employment under pain of imprisonment and that none should receive or retain in his service any laborer so departing. There was an insufficient supply of labor and the ordinance was largely disregarded. In the following year Parliament, therefore, reenacted the ordinance as the Statute of Labourers [25 Edw. III, st. 1, c. 1 (1350)]. Despite strenuous efforts in its enforcement in 1360 it became necessary to amend the statute to provide for more severe penalties (34 Edw. III, c. 9, 10, 11). By the force of these enactments and a later act [Statute of Artificers, 5 Eliz., c. 4 (1562)] an attempt was made to fix the status of labor and to punish enticement. With the passage of time a right in the employer to the uninterrupted services of the servant as against an enticer was recognized without recourse to the statutes [Blake v. Lanyon, 6 T. R. 221 (1795)].

The industrial revolution and the consequent overcrowding of labor in some of the industries, notably cotton weaving and spinning, led to a revival of control by statute. The Statute of Labourers had been aimed at the enticement of the servant from employment. A new development due to the factory conditions is now to be noted. Enticement suffered a change and addition in character. Groups of laborers forming themselves into societies were interfering with the relationship of master and servant for the purpose of ameliorating the conditions of employment. They sought to induce workers to leave their employment in order to exert pressure upon the employer. To meet this situation the Combination Act of 1799, which was amended and reaffirmed in 1800, was passed (39 Geo. III, c. 81; 40 Geo. III, c. 106) prohibiting combinations of workmen. Attempts on the part of labor to have the provisions of the Statute of

Artificers enforced were denied under the influence of the laissez faire ideas, and those provisions relating to wages were repealed [53 Geo. III, c. 40 (1813)].

The Combination Act in the meantime although not strictly enforced had a very definite retarding effect on the organization of the workers, and finally in 1824 largely because of the efforts of the more courageous economists, particularly Francis Place, it was repealed [5 Geo. IV, c. 95 (1824)]. But violent efforts toward organization on the part of the workers followed the repeal, and the Combination Act of 1800 was substantially reenacted [6 Geo. IV, c. 129 (1825)]. The Statute of Labourers as modified continued in effect until 1875.

The next phase of preventing the enticement of labor is found in the development of the doctrine of inducing breach of contract. This dates from the year 1853, when it was held actionable for a third person to induce the breach of contract of employment in order that he might obtain the services of the employee (*Lumley v. Guy*, 2 El. & Bl. 216).

Employers seeking to prevent unionization required employees to sign agreements not to join unions (so-called yellow dog contracts). Such contracts were the basis of appeals to the courts for relief enjoining unionization. The question whether such relief may be had is still unsettled, although in *Hitchman Coal & Coke Co. v. Mitchell* [245 U. S. 229 (1917)] it was successfully obtained from the Supreme Court of the United States. The decision has been criticized on numerous grounds and its basis in law seems indefinite. It has even been suggested that it was based on the doctrine that it is illegal to entice servants even in the absence of contract. Inasmuch as this doctrine arises under the English Statute of Labourers, which has never been enforced in the United States, it is questionable.

As the shortage of labor caused by the Black Death brought about keen competition resulting in the Statute of Labourers, so the increased demand for labor caused by exigencies of the World War brought similar need for social control. Manufacturers of essentials in the United States found themselves in competition with those of non-essentials and amongst themselves for a sufficiency of man power. There was at the same time a great migration of Negroes from the south to the manufacturing plants of the north. To meet the first condition there was inaugurated under the Department of Labor a War

Labor Policy Board, which allocated labor among the factories. A Federal Employment Service was set up for the distribution of labor. In the south drastic legislation was passed to prevent Negroes from going north. In Arkansas, Georgia and Alabama laws were enacted to suppress the activities of labor agents. An ordinance adopted in Montgomery, Alabama, subjected any person who enticed any laborer to leave the city to certain penalties. Advertisements urging laborers to leave the south were made illegal. In the main such preventives were ineffectual, for high wages proved greater as an inducement than law as a deterrent.

This was in a true sense social repetition. When labor is scarce, labor is sought, and employers seek methods to stop competition. They are, however, largely ineffectual and enticement continues until the conditions which cause it lessen.

ENTREPRENEUR. The term entrepreneur was used by Cantillon in his *Essai sur la nature du commerce* (1755) to designate those dealers who "buy the wares of the country . . . give for them a fixed price to sell them again wholesale and retail at an uncertain price." The distinguishing characteristic of the entrepreneur was thus the bearing of uncertainty. Among French writers the distinction between the capitalist, or passive investor, and the entrepreneur was common, together with the parallel distinction between interest and profit. But among English economists down to J. S. Mill the distinction

was absent, the single term capitalist and the single income category of profit being used. The new attention, toward the end of the nineteenth century, to the special function of the entrepreneur and to profit as distinct from interest on loan funds must be largely attributed to the influence of Francis A. Walker. J. B. Clark and less explicitly Marshall are the foremost among recent economists to lay special stress on the unique importance of this function.

There remains, however, no great agreement as to the essence and the frontiers of this function. Among many writers the work of coordination or management has been stressed. The entrepreneur has been identified with the captain of industry, ordering and marshaling the company under his control. Profit has been defined as the wages of management or the gross earnings of management, and a distinction was drawn between profit and interest parallel to that between the shares of the active and of the sleeping partners in a business. Marshall described "the supply of business power in command of capital . . . as consisting of three elements, the supply of capital, the supply of the business power to manage it, and the supply of the organization by which the two are brought together and made effective for production," the gross return to these services being governed by causes "less arbitrary" and presenting "closer analogies to those which govern other kinds of earnings than is commonly supposed" (*Principles*, 8th ed., bk. vi, ch. vii, sect. 7).

Other writers, however, following Cantillon, have stressed the facing of uncertainty as a unique function qualitatively different from other economic functions and have represented this as the essential mark of the entrepreneur. In so far as uncertainty as to the future is an integral feature of economic change the bearing of uncertainty must necessarily be identified with the making of the ruling decisions in the economic system. Hence the entrepreneur is in a very special sense the key factor in economic life. This conception has been carried furthest by Knight, who has pointed out that the significant feature of economic change is precisely the incalculability of the results of economic activity. The entrepreneur in taking the ruling decisions is the person who gains or loses according as the actual outcome of events exceeds or falls short of the anticipated outcome. According to Knight, "with uncertainty absent, man's energies are devoted altogether to doing things; . . . in a world so built that perfect knowledge is theoret-

ically possible, it seems likely that all organic readjustment would become mechanical, all organisms automatic. With uncertainty present, doing things, the actual execution of activity, becomes in a real sense a secondary part of life. The primary problem or function is deciding what to do and how to do it" (*Risk, Uncertainty and Profit*, p. 268).

This difficulty of definition is more complex than would appear at first sight, and the confusion which exists in economic literature on the subject seems rooted in a formal difficulty rather than in a practical one; that is, in a question of logic rather than in any inability to decide what the business man actually does. It is most conspicuously in the theory of the entrepreneur and of profits that contradiction seems to arise from that common failure to realize whether one is solving a logical problem or pursuing a purely empirical inquiry. Economic theory in its classical forms has essentially been a theory of equilibrium concerned with the pricing of a collection of commodities and services, the unknown of the problem being determined by the requisite number of known constants in the situation. It is clear that in such a problem uncertainty, in the sense of the incalculable, has no meaning: the very possibility of a solution of the problem excludes any deviation of the actual from the calculable. In a system of economic equilibrium the work of the entrepreneur cannot be qualitatively different from that of any other agent of production. But in so far as a given set of historical circumstances necessitates that the work of management and coordination should be combined with certain other attributes, with the possession of capital and certain business connections and good will, a realistic theory of distribution must include a category of entrepreneur profit separate and distinct from the categories of wages, interest and rent. The entrepreneur function is in fact a composite function, the elements of which are not completely separable; and since the conditions of supply and demand for this composite function are different from those for its separate elements in isolation, the price of the whole is not equal to the sum of the prices of its separate parts. For this reason capitalist profit, as the historically conditioned income of the capitalist entrepreneur, is essentially an institutionally determined category, and least of all economic incomes is it a "natural" category of distribution.

As soon, however, as the concept of the incalculable is introduced, the problem becomes to-

tally different and incapable of solution within the framework of economic theory as customarily conceived. To "explain" the entrepreneur's function and his reward in terms of uncertainty is not an explanation in any deterministic use of the term, but rather the negation of it. There is no normal profit, since *ex hypothesi* profit is the incalculable deviation of the actual from the anticipated. Because the entrepreneur is simply a gambler in the economic lottery, one cannot interpret his actions in terms of any rational calculus; for in this lottery the size and number of the prizes as well as their distribution are unknown.

There is left then only the purely empirical definition of the entrepreneur as the recipient of the non-contractual, or residual, income. The entrepreneur bargains with all the agents of production, the agents necessary for the actual doing of things, contracts to give them a certain income and appropriates the difference between the sum of these contracts and the actual outcome of the productive process. The entrepreneur is, as it were, the windfall absorber of the economic system. But the role is not a merely passive one, since his work of contracting for the hire of the agents of production inevitably implies the taking of the ruling decisions of economic life, decisions which will themselves influence the incompletely calculable future. All the productive functions concerned with the execution of decisions already made, routine management and coordination, can, theoretically at least, be delegated to particular persons and hired for a contractual income. But the inseparable nucleus which remains consists of the taking of those decisions with regard to the future which involve uncertainty; and it is this political, as distinct from executive, element in the conduct of economic affairs that is the entrepreneur function par excellence.

The distinction on which this definition rests is both actual and important. But it is by no means easy to establish in concrete situations. It does not necessarily follow personal lines: certain persons may combine in their income both contractual and windfall elements, and it may often be difficult to attach the label of entrepreneur to any clearly defined class of persons. Bondholders and debenture holders are clear cases of contractual capitalists. But what are the holders of preferred stock? Are ordinary holders of common stock to be classed as entrepreneurs? Or only the chosen few of them who exercise control in a modern corporation and hence make the ruling decisions? And do not fluctuations in

earnings and employment on the part of wage earners represent a partial shifting of the fruits of uncertainty upon labor? In earlier types of business, preceding the joint stock company, it was much easier to single out the active partner of a business as the entrepreneur. With the modern prevalence of joint stock enterprise it is difficult to localize actual control over key decisions; it is difficult to identify such control with the bearing of the results of uncertainty; and it is difficult to draw a clear line of demarcation between contractual and non-contractual income.

A guiding motive behind modern theories of the entrepreneur has been to rebut the Marxist estimation of the capitalist as an exploiter, performing merely a historically transitional role and receiving an income created by certain historical institutions and not by a natural or inevitable order of relationships. The justification of the entrepreneur which has been implicit in most of these modern theories has consisted in postulating certain functions which are not merely institutional and historically relative but possess some absolute significance in the sense that they would be required in any conceivable economic order, and in showing that the entrepreneur's income is related to these functions in some particular way. The function of routine management and coordination, to which most of the older writers made reference, clearly need not be associated with capital ownership and the receipt of profit: with the growth of corporations this function has been increasingly delegated to persons remunerated by a contractual salary or wage. There remains the function of bearing uncertainty and of taking those ruling decisions which involve uncertainty. In an alternative economic order, say a socialist system, uncertainty would be borne by the community as a whole and the taking of crucial decisions would presumably rest with those persons to whom the community agreed to delegate them. The question then becomes a purely administrative one: would wiser or less wise decisions be made under the one system than under the other? And to the extent that such decisions are *ex hypothesi* a gamble, in the dark, it is hard to conceive of any rational answer to the question. At any rate, a merely empirical definition of the entrepreneur seems to sustain no a priori implication that the association of this function with a particular class of persons is necessarily desirable or inevitable.

ENVER PASHA (1881-1922), Turkish statesman. Enver Pasha attended Turkish military schools and became an officer in Macedonia, where he acquired the Young Turk ideas of reform which were embodied in the program of the Committee of Union and Progress. Early in 1908 he and Niazi Bey inaugurated the first Turkish revolution, which brought about the fall of Abdul Hamid and the introduction of a number of reform measures. Appointed military attaché in Germany, Enver became acquainted with the German plan in the event of world war of blocking the British road to India at the Suez Canal and opening a way toward the conquest of India through Transcaucasia and Transcaspiia as well as through Persia and Afghanistan. These ideas became associated in his mind with his own plan for the achievement of pan-Islamic and pan-Turanian ideals—more concretely, for the recovery by Turkey of control in Egypt and for the union of all Turkish speaking peoples of the world under one government.

In 1913 Enver took part in the overthrow of the conservative government and the restoration of the Young Turks to power. A year later he became minister of war and was active in negotiating with Germany the secret treaty of alliance of August 2, 1914. He is believed to have helped essentially in bringing Turkey into the war on the side of the Central Powers. In 1915 and subsequently he supported Talaat in destroying the Armenians of Turkey, who were an obstacle to complete Turkish control and to the

achievement of the pan-Turanian plan. After the Russian collapse Enver vigorously supported an advance eastward in pursuit of pan-Turanianism. Forced to resign after the Armistice, he fled to Germany and thence to Russia, still cherishing pan-Turanian dreams. During his period of power Enver had cooperated steadily with the Germans and had aided considerably in the Turkification of the Ottoman Empire and in the attempt to free Turkey from foreign control. In 1921 he was allowed to go to Russian Turkestan, where after a break with the Bolsheviks he joined and reorganized their opponents in Bokhara, the Basmachi. He was slain in battle shortly afterward.

ALBERT H. LYBYER

ENVIRONMENTALISM is the tendency to stress the importance of physical, biological, psychological or cultural environment as a factor influencing the structure or behavior of animals, including man. Although the two are inextricably intertwined, environment is often contrasted with heredity. Throughout history ruling groups have stressed heredity as a rationalization for their status, while rising insurgent classes, advocating changes in institutions, have considered the social environment to be the basic determinant of behavior and achievement.

The influences of physical environment have received attention from early historical times. Hippocrates attributed many diseases to climatic or atmospheric conditions. The localization of religious and medical influences, as at Delphi and in the incubation rites at Epidaurus, tended to stress the importance of definite environments. The color of the Ethiopian was attributed in the myths to the great heat of the sun, which also produced the deserts. Herodotus emphasized the geographical conditions underlying Egyptian civilization, and Thucydides called attention to the importance of geographical factors in Greek civilization. Strabo and Diodorus Siculus were alive to the importance of geographical details. Modern views on this subject date from Bodin, who attributed much importance to climatic zones and to longitude, latitude and altitude as determinants of individual and ethnic qualities. Montesquieu refined the arguments by discussing the correlations and the reasons for them in greater detail. Herder oriented man and civilization in the world of material things and forces and indicated the influence of place on life, thought and civilization. Buckle carried the argument for-

ward in amplified form, and the anthropogeographical schools of Ratzel, Kirchoff, Semple and Huntington now hold the thesis that physiological factors determine the fundamental character of civilizations. A reply to this position had already been made by Turgot and d'Holbach, who pointed out that there is no constant association of a given type of civilization with a given environment, that similar civilizations flourish in dissimilar environments and dissimilar civilizations in similar environments. Turgot insisted that geographical factors must not be accepted as an explanation of the characters of civilizations until other methods of explanation have been tried and found wanting.

The influence of environment on living beings through the adaptation of biological structure was emphasized by the Greeks and in modern times especially by Lamarck and Erasmus Darwin. Charles Darwin and Alfred Russel Wallace gave many instances of the influence of environmental selection upon the characteristics of species, and the selective agency of environment has since been continuously emphasized. The importance of social or cultural environment was first stressed in some detail by the sophists, who considered ethical standards, laws and customs to be a reflection of the accidents of social circumstance. According to their teachings the individual merely reacted to the culture to which he had become habituated. The stoics, however, emphasized the importance of controlling the will as a means of attaining independence of circumstance. A theory of social determinism is implicit in Plato's and Aristotle's utopias and in all later utopias, for they shape individual careers by remodeling the social and political order, but there is little explicit statement of the doctrine by utopian writers. The doctrine that the past determines the present and that the present is the amplified past—the doctrine of culture continuity—is equivalent to stressing the importance of historical cultural environment. This view, illustrated in many Greek and Roman writers, is first explicitly expounded by the French writers—Bodin, Fontenelle, Turgot, d'Holbach and Condorcet. It is an expression of the more inclusive view that environment influences the mental life of man. Its more explicit statement and illustration in terms of psychology begin with Pavlov and with the subsequent exploitation of the theories of conditioned responses, but the background of psychological environmentalism is the *tabula rasa* theory of Locke and the associationism of

subsequent psychologists. Applications to the problem of crime would seem self-evident but they were not made until More published his *Utopia*. Robert Owen was the first vigorous exponent of the view that character is the result of circumstance. In the United States Lester F. Ward stressed the importance of the environment through his emphasis on the role of opportunity. In Europe the historical materialists developed their social philosophy upon the environmentalism implicit in the writings of Karl Marx. Environmentalism is now the dominant social philosophy underlying the program of the leaders of the Soviet Union.

Any discussion of the influences of environment implies the recognition of at least two main factors or variables, one of which has influence, immediate or indirect, upon the other. Neither factor is wholly passive, else there would be no influence, because there would be no response. The environment which influences is itself influenced and therefore either may be considered variable or constant. Strychnine does not disintegrate the physical organism unless the strychnine is disintegrated; typhoid germs do not kill the patient unless the patient reacts to them; pollens do not cause hay fever unless the patient is sensitive to them. Unless therefore the two factors are brought into rapport either directly or through a medium in which the influence of the one is exerted upon the other and conversely, there is no environmental influence. The temperature of the center of the earth or that of the atmosphere twenty miles above the earth does not influence man unless these temperatures are somehow transmitted to man; that is, are made effective. These considerations apply to all phases of environment whether social, psychological or biological. It follows then that the influences of the physical environment cannot be discussed without first defining the range of reaction of the things acted upon. Experiments with *Drosophila* show that certain individuals inherit in sex linked form a defective abdomen. But the abnormality appears only in individuals with the defective gene who are kept in a moist atmosphere. Those which have the defective gene and are grown in a dry atmosphere do not, despite the defective gene, exhibit the abnormality. Only a specific combination of gene and humidity and temperature therefore produces normality or abnormality, as the case may be, and the result may be attributed to any factor involved, for it occurs when all are found together.

Another sex linked abnormality which shows similar fluctuation is the occurrence of double joints or double legs in these flies. Although the defective gene is present, the abnormality appears only when the flies are grown under a certain maximum temperature. If the temperature is lowered to a certain point, the defective gene inspires the abnormality; in the higher temperatures the defective gene does not occasion duplication of legs. Thus the influence of either variable depends upon the character of the other. It is entirely a matter of choice in either case whether the result is attributed primarily to gene constitution or to temperature. Only by holding one of two or more factors constant can one judge their relative importance; otherwise one is in the quandary of Pepys, who did not know whether to ascribe his preservation to his hare's foot or to his daily pill of turpentine.

The Himalayan rabbit usually has white hair except at the extremities, which are black. It has been found experimentally, however, that if the temperature is lowered beyond a certain point the young grow white hair over the entire body. One may cite this fact as an obvious influence of temperature. But changes in temperature do not affect other animals in this way, and this instance is therefore not a rule but an exception. The phenomenon may be characterized as the Himalayan rabbit's typical plastic response to certain variations in temperature. It is arbitrary whether one refers to the phenomenon as the influence of temperature or as the response of the rabbit, for both factors are essential to the result. The temperature influences the rabbit only in case the rabbit reacts to it and to the extent that the rabbit reacts.

In identical twins the hereditary factor is the same, for they have identical genes, a condition not likely to occur in any other filial relatives. Even when reared separately, however, the environments may not be significantly different in kind; and even when this is the case, so far as external environment is concerned, the mental environments of the two individuals may be important factors in the result. The relative influence of social environment in the case of identical twins has not yet been satisfactorily determined, and much of the evidence is conflicting.

Many diseases with a possible hereditary basis are also a matter of environmental influence. Thus some may inherit a weak constitu-

tion and so be susceptible to many diseases, but most of the diseases will not be contracted unless the individual is exposed to them. In such cases control of the environment could effect the same immunity as could control of heredity. The introduction of vaccines and serums into the system may enable the organism to cope with its environment in more adequate fashion, and thus man's artificial environment may modify nature's pathology. A hereditary marked deficiency in the production of thyroid leads to cretinism, an underdevelopment of both body and mind; the administration of thyroid extract improves the metabolism, and body and mind are benefited.

There is of course a relation between physical environment and biological type. Fishes do not swim on the land, and mammals do not walk on the bottom of the sea. The coats of animals are adapted to climatic conditions, and often even color of skin, hair or feathers shows adaptation. The converse of the influence of environment is the response of the animal to its environment. For this reason the Darwinian phrase natural selection is often meaningless. When a small jawed lobster struggles with a large jawed one and the large jawed one survives, nature is little concerned except in so far as nature is embodied in the two lobsters. They decide the issue, and the cunning and persistence of a small jawed lobster may more than counterbalance the indifference or the stupidity of a large jawed one. The influences of the physical environment upon the structure of man, so far as these vary racially or geographically, are still undetermined. That food influences stature is known, but it appears improbable that differences in food are ultimately responsible for the difference in stature between, for example, tall and short Negroes in Africa or between Welsh and Scotch. There is a significant correlation between size of nasal aperture and temperature and humidity, with temperature more highly correlated than humidity. In the Old World the more heavily pigmented peoples predominate in regions in which the actinic rays of the sun are more potent, but no such correlation appears to exist in the aboriginal New World, and there are many marked exceptions in the Old; so that a correlation of inherited pigmentation with environmental conditions is still a debated question. There is, however, considerable evidence that a change from tough to tender food, with decreased use of chewing muscles, affects size

of teeth, length and massiveness of jaw and shape of head and face; and the general increase in stature which has characterized European peoples in both the Old World and the New during the last hundred years or longer is usually attributed to better nutrition. Experiments in controlled room temperature and humidity indicate a decrease in physical efficiency when the temperature is raised above 68 degrees. Variations in temperature appear to affect ability to do either mental or physical work to a greater extent than do comparable variations in humidity when temperature is held constant. It has been found also that when the air is in gentle motion the ability to do mental work increases. Such experiments have an immediate application to modern life, but it is doubtful that temperature itself will ever be an important indication of mental achievement. Within ascertainable bounds the intellectual significance of temperature will depend upon the environed minds and their problems rather than upon temperature and humidity.

It is therefore almost meaningless to speak of the influence of geography upon history unless the civilization and the times are known. The seas which once isolated the British Isles have become highways to all parts of the globe not because the physical factors changed but because the civilization changed. In some regions rivers separate peoples; in others they are utilized as a means of communication; and for the same people their significance changes with changes in technology, trade and political relations. The influence of environment upon primitive cultures then can be discussed only in terms of the achievements of the respective cultures. Man can work only in and upon his environment, but the tools with which he shapes his civilization are not the creations of the physical environment. The environment furnishes the materials for his houses, but man as the architect furnishes the plans. Hence in comparable environments man sometimes builds contrasting types of habitations, because in various places he selects different building materials and arranges them in different fashion. The primitive hunter is dependent upon game, but he is no less dependent upon his bow and arrow, his traps and his knowledge of the habits of the animals. In short, his culture makes his environment significant, for game is useless unless he has the tools and the skill to secure it. Every utilization of environment is indeed a culture achievement, an assertion that man to

that extent is master of his environment; for the environment influences man only when and in so far as man reacts to it. In many cases the higher civilizations have shown little respect for a particular type of environment. In both the New World and the Old the highest civilizations of their day have flourished in tropical and subtropical regions—the civilization of the Mayas in the New World, the civilizations of Egypt and Babylonia in the Old. Through the centuries the higher and the highest achievements in civilization have shifted from one environment to others, which in some cases are as contrasting as that of Egypt and that of Great Britain. No one type of civilization has characterized a given environment. Egypt, Mesopotamia, Iran, North India, Spain, northern Europe, have all harbored very different types of civilizations in successive centuries. No one type of civilization is constantly associated with a given environment, and, conversely, similar civilizations flourish in contrasting environments. Indeed, at least in all the higher civilizations the changes which the culture has made upon environment are more notable than the changes which environment has effected in the culture. The culture's ability to cope with environment depends largely upon two factors—technology and knowledge. These are inseparably connected; each amplifies and supports the other. The development of larger sea craft makes waters which previously were an isolating factor a means of communication; irrigation and cultivation convert the desert into a fertile area. The measure of man's technological development is the measure of his control over his environment. Knowledge discovers and to that extent creates new elements in the environment, as when man learns the uses of coal and the metals, the application of water power, the presence and uses of new substances such as oil or aluminum. His knowledge is the yardstick which determines the compass of his environment, its constituent elements and their applications.

The mind of man like the body of man cannot develop in a vacuum. It develops only in reaction to environing influences, in reaction to its immediate environment and to the intellectual and cultural content which it has built out of its environment. Hence mind always partakes of environment, and any analysis of mind will yield elements of its environment. Ulysses' statement, "I am a part of all that I have met," is the unwitting testimony of every

mind: it is a part of all that world with which it has contact through the senses or through sense. This view was emphasized by the impressionists and the associationists of the older psychology, and it is a central doctrine in the position of those who emphasize the role of conditioned responses. One behaviorist has proclaimed the doctrine in the extreme form of the assertion that, given a child at birth and complete control over it, one can make him what one will. But this doctrine leaves out of the reckoning another factor essential to any influence of environment, namely, the unique reaction of the child; it presupposes that every individual will react in identical manner to the same stimuli. But no two individuals are identical in structure, and no two react identically to the same stimuli. Individuals may conform to a pattern, but no two people react identically at any time to the same stimulus; indeed, no individual reacts in identical manner to the same repeated stimulus, as, for example, to identical food, light or color. The history of psychological doctrine and dogma is itself an example of the reaction of mind to environmental stimulus. Psychological theories have had a continuous and coherent development from the earliest phases of thought to the present time: the psychologies of one decade are but a modification of those which prevailed previously. They are, moreover, related to the prevalent scientific and philosophic doctrines of the day in which they are enunciated and of which they are in truth but a phase. In short, the interpretations of mind are as environed and as environmental as mind itself. Development in any science presupposes environmental influence, for unless a phase of thought is influenced by its own past it dies; and contemporary psychology is much more a reaction to past psychology than a naïve or native reaction to its data. In no other way is scientific development possible.

In all phases of social and cultural life the influences of environment are potent. The play of custom, tradition and the mores, the influence of institutions, the binding force of legislative and executive acts, are essentially responses to social environment. Law abidance or the lack of it is a state of mind and is contagious; the prevalent types of reaction to the social environment become an important part of the environment itself. A prevalent disposition to obey laws is a more effective influence than the police and the courts; thus the unwritten sanctions are more important than the written, for

they determine the reactions to the written. Similarly, delinquencies, lapses from law abidance, are in large part environmental. The character of crimes varies somewhat with culture; where people do not wear clothes pick-pockets do not flourish; where writing is not known there is no forgery; and where there are no habitations there is no housebreaking. It is not easy to be a thief in a culture in which the community is small and one's possessions cannot be concealed; the conditions which make it difficult to protect one's property also make such protection superfluous. The more complex life of the higher cultures makes possible many crimes which are not possible in the primitive cultures, and every new device added to the culture—factories, banks, automobiles, for example—makes possible a new kind of crime. The studies of the rates of juvenile delinquency in areas of Chicago show that these differ regionally within the city and irrespective of the nationality group; so that although the population may change its national and to a considerable extent its cultural complexion, the rate of juvenile delinquency for a given district remains relatively constant. The persistence of certain delinquency patterns in given geographical areas suggests environmental influence, although the basic factor is probably not physiological but cultural. Each individual has a vast number of capabilities and potentialities and is able to respond to diverse conditions and situations. The stimuli which play upon him, especially those in the early years of his life which determine the direction of his development, decide the nature of his career.

The lowest forms of life react to the environment mainly by adaptation to stimulation through the sense organs or through sensitivity to changes in temperature, light, pressure or chemical processes upon or within the organism. There is adaptation to environment, but the manner of adapting and the elements of the environment to which adaptation is made differ throughout the gamut of animal life. The plasticity of the organism, the character of the enclosing integument, the specialization of parts and of functions and perhaps most of all the mobility of the organism affect the character and often the degree of the adaptation. Thus the kind of adaptation possible for crustaceans differs from that of the non-crustaceans; that of simple organisms from that of the more complex; that of the slow, restricted to short range activity, differs from that of the swift,

with long range activity. The *Paramecium* responds to changes in temperature, and birds respond presumably to seasonal changes in air temperature, but the character of the response is very different in the two cases. The bird may become adapted by molting or by growing more and larger feathers, and it may travel thousands of miles to warmer or to cooler climes, whereas the *Paramecium* merely moves slowly from one place to another. Similarly, the types of adaptation within various human culture groups exhibit a wide range. In one group the adaptation to temperature may involve the utilization of all modern technology and science; in another it may merely lead to hunting a shady spot or a sunny one. Reaction to environment is also modified through conscious selection. The hunt for food and the search for better habitation are examples of such active selection by the mobile organism. By the selection of new materials from the environment and by the development of new techniques for dealing with them man has built an artificial environment. From early times to the present man has modified the range of his environment. Trade and communication enable him to live in larger environments; history and prehistory recover the past and make it a part of present environment; the microscope reveals a new world of the infinitesimally small, unknown to the unaided sense organs, and man greatly increases the range of his environment in the new dimension; the telescope brings previously unseen stars and star universes within his ken, and his environment now expands into one of hundreds of thousands of light years. To this artificially created universe, not less real than the universe of the unaided senses and immeasurably greater, he now responds because it has become a part of his environment, although previously, so far as he was actively or consciously concerned, it did not exist. Thus the environments in which various men live even within the same culture group may differ significantly, especially in the higher cultures. The world of the business man is not that of the chemist, the environment of the physician is not that of the literary critic, and the world of the physicist differs more from that of the miner than Adam's world differs from that of an illiterate descendant of today. Even the same objective stimulus may belong to different environmental universes. For example, on the morning now known as the day of the battle of Austerlitz the sunshine fell upon a certain spot of ground. The lowly forms of life

wriggled in the slime; insects unfolded their wings and flew; men rubbed their eyes and uttered irrelevant remarks; an emperor arose, made a gesture and his command moved an army into action. Thus the responses to environment as well as the environments may belong to different universes. The patterns of reactions of each of the two variables limit the influence of one upon the other. A change in the dimension of either poses a new problem, which can be answered only empirically.

EÖTVÖS, JÓZSEF, BÁRÓ (1813-71), Hungarian statesman and publicist. In the period of reaction both preceding and following the struggle for national liberty in 1848 Eötvös ranks with Kossuth, Stefan Szechenyi and Ferencz Deak as a champion of a social and spiritual reconstruction which was to serve as the basis of a new Hungary. A member of the feudal landowning class, he championed causes aimed at the destruction of feudalism; a devout Catholic of deep religious feeling, he became the instrument of religious toleration; an intense nationalist, he did not confine himself to mere chauvinism but concerned himself with the rights of other minority nationalities, predicting with prophetic vision for both Austria and Hungary the catastrophe which would overcome them on the refusal of these rights.

Eötvös was a successful novelist before his thirtieth year. During his travels abroad he came into intellectual contact with the currents of west European thought which had been set in motion by the French Revolution, and as

early as 1838 he wrote vigorously on prison reform, advocating the humanization of Hungary's mediaeval jail system. In the feudal parliament of 1839-40 he raised his voice in behalf of the religious and political rights of Protestants and Jews, whose emancipation he effected a quarter of a century later as a member of the Andrássy cabinet in 1867. In his satirical novel *A falu jegyzője* (3 vols., Budapest 1845, tr. by O. Wenckstern as *The Village Notary*, London 1850) he denounced the subjection of the masses and emphasized the need of reform in county government. In *Magyarország 1514-ben* (Hungary in 1514; 3 vols., Budapest 1847), a historical novel, he pointed out that the cruel suppression of the peasant revolt led by Dózsa in the sixteenth century had resulted in two centuries of foreign rule, and drawing a parallel for the nineteenth century he advocated the immediate abolition of serfdom. As minister of education and cults in the parliament of 1848 he secured academic freedom for the universities, and later through the law of 1868 declared popular instruction to be the duty of the state.

His political theories were mainly embodied in *Der Einfluss der herrschenden Ideen des 19. Jahrhunderts auf den Staat* (2 vols., Leipsic 1851-54). As a means of resolving the conflict between the ancient concept of the authority of the state and the Christian emphasis on individual liberty Eötvös suggested a distribution of power between the central government and the autonomous local units which would safeguard individual liberty without undermining state authority. In his opinion the ruling ideas of the nineteenth century—liberty, equality and nationality—must be adjusted to the state. He pointed out that if the state were based on complete equality, the imposition of the will of the majority would menace individual personal liberty. To resolve this conflict between political equality and personal liberty was the task of the political philosopher, who must devise and secure guaranties against the misuse of the power of the state without, however, endangering its existence. Despite his unwarranted optimism as to the outcome of these conflicts and although Eötvös did but little justice to contemporary political economy, the sweep and profundity of the book led to its recognition far beyond the borders of Hungary.

EPICETETUS (first century A.D., exact dates unknown), Roman philosopher. A crippled slave, Epictetus studied under Musonius, became a freedman in later life and was exiled in 89 A.D. in consequence of Domitian's edict against the philosophers. His view of the world was substantially that of the stoics. Unconcerned with science or metaphysics, he considered skepticism and agnosticism unworthy of elaborate refutation and sought to teach the right way of life. He allegorized the popular polytheistic cult, teaching the worship of an all pervading, all embracing, thoroughly rational divinity; he did not believe in individual immortality. Epictetus regarded man as essentially weak and in his lower, animal nature irrational. He considered therefore a consciousness of the contrast between man's imperfection and the rationality and perfection of the universe as the condition of striving for moral anchorage. General ethical principles are innate, and philosophy has but to develop them through dialectic elaboration and logical criticism of possible errors of judgment. Wisdom is submission to the inevitable cosmic fatality. All striving after exterior aims must be abandoned. The essential is for man to know that the only thing within his power is his conscious attitude in accepting whatever happens to him. Through preserving deliberate equanimity, man can always be free and happy; he can will fate or, as we should prefer to say, imagine that he wills it. Asceticism, the habit forming exercise of his mental reactions, is the main way to this goal. Suicide is permissible as soon as man is convinced that death is imminent anyhow; the impossibility of making an honest living is to be interpreted as a divine invitation to the soul to return to its source. This non-resistance against fate implies that the philosopher will not demand perfection of others or of the social order. He will not react angrily even against criminals, for they are unfortunate and blinded by ignorance. Selfish emotions are to be subdued and a generous love for all fellow creatures cultivated. All men—whether slaves or free—should be considered as brothers and children of one divinity. Man should love even those that torture him. Men should be social beings; virtue consists in attention to duties proper to one's social position and human relationships, such as those of master, slave, parent,

child, magistrate, citizen. The perfect sage will neither marry nor breed children; he will hold aloof from national politics, which is narrow compared with the ideal of a universal state.

In spite of fundamental general differences, striking parallels exist between a number of sayings of Jesus and of Epictetus; the latter's discourses must be read to understand Pauline morality. It is interesting to see how deeply this wisdom of one who in a lowly condition was anxious to preserve a proud feeling or a consoling illusion of inalienable freedom appealed to Marcus Aurelius, an emperor who considered himself the first servant of the Roman state. Such a philosophy as that of Epictetus goes far to explain the bitter reflection of the proud aristocrat Tacitus—himself a disciple of stoicism—on his Roman compatriots "rushing into slavery" instead of defending their republican liberties. The transformation of Rome into a despotic monarchy was conditioned by the evolution from early revolutionary stoicism through the "gentlemanly" doctrines of the "middle stoics" to the pious humility of the slave Epictetus. Both are characteristic of the progressive orientalizing or "barbarization" of the empire, Epictetus being the nearest western approach to the eastern ideal of a bodhisattva.

EPICUREANISM. Epicureanism, a Greek philosophy named after its founder, Epicurus (341-270 B.C.), belongs to the post-Aristotelian, Hellenistic period in which Greek culture extended its influence throughout the East and

was itself transformed in the process. The city-state, of which the individual Greek felt himself an integral part by race, religion, tradition and aspirations and which he regarded as the necessary condition for the attainment of his spiritual autonomy and perfection, became absorbed and subjected to a new and larger unity. An indifference to the life of the state developed, which in the case of the cynics and stoics expressed itself in the form of a broad cosmopolitanism or, as with the Epicureans and skeptics, in a preoccupation with individual ends and relations and with the problem of the highest good, to which every interest, even the theoretical, was subordinated. Knowledge was valued only as a means of solving the ethical problem, that is to say, as a condition and instrument of attaining that state of spiritual tranquility (*ataraksia*) in which the mind makes itself independent of every external discord and which is realized in the ideal type of the wise man. Therefore the various kinds of naturalism propounded by cynics, stoics and Epicureans are all forms of response to a need for spiritual liberation.

For Epicurus this spiritual liberation was best to be achieved by a naturalistic explanation of phenomena and a naturalistic conception of life based on the underlying principle of the infallibility of sensation, which was to free the mind from the disturbing factors of error and superstition. Epicurus thus combated the fear of the supernatural and the religious superstitions particularly rife in his time owing to oriental influences, as well as Platonic and Aristotelian finalism and the providentialistic fatalism of the stoics. For the concept of a little finite world fashioned by design he substituted the idea of the infinity of the universe, of words and of beings that resulted mechanically from the fortuitous shufflings of atoms, dissolving if unfit, persisting as individuals and as species if fit, to survive. The divinity that Epicurus recognized was a model of perfection who by this very essence of his being was precluded from interfering in human affairs, and religion was thus a matter of pure disinterested homage to this absolute ideal. As a materialist he likewise combated the depreciation of nature and the eschatological preoccupations of idealistic philosophy. In ethics he developed a system of egoistic hedonism which, unlike the crude doctrine of the Cyrenaics, was raised to the level of a serene spirituality in which even egoism is vanquished by the longing for spiritual perfection and the claims of friendship, justice and the moral conscious-

ness. For the idealistic religious myth of the golden age he substituted the affirmation of a primitive condition of uncultured simplicity, from which mankind has developed toward spiritual perfection by means of the social compact and the resulting communal relations from which are progressively born affections, language and the arts. Selfish interest and utility although they are the initial driving forces become converted into moral consciousness and an altruism capable even of sacrifice. The observance of justice although arising out of convention and based on utilitarian fear of the injuries and dangers of injustice comes to be for the wise man an act of inner compulsion. In regard to political affairs the Epicureans were completely negative in their attitude toward the state. The ideal state of tranquility was best achieved by remaining aloof from public life, and any form of political authority was welcome so long as it assured peace and order.

A certain partial development of the teaching of Epicurus took place in antiquity, as in the unfolding of the principle of inductive logic by Philodemus and the inquiries into the psychogenesis of friendship and the growth of the theory of progress among the Roman Epicureans. Moreover, it received its widest currency as a result of its formulation by Lucretius in his *De rerum natura*. But the religiously dogmatic character of the school, which saved it from losing itself like other schools in eclecticism, without preventing important infiltrations of its spirit into the eclecticism of others, as in Seneca and Marcus Aurelius, did succeed in checking its development. As a result of the works of Cicero, Plutarch and the Christian writers a vulgar interpretation of Epicureanism as egoistic sensualism and as the negation of all idealism and religion became widespread and still persists. In its true form, however, it contained a lofty message capable of stirring the minds of men, and for centuries in the Hellenistic Roman world it served practically as a new religion for great numbers of enthusiastic followers. It was overpowered by a soteriological mysticism and was revived in the Middle Ages only as a heresy. But its vindication, begun by humanists like Petrarch, Boccaccio, Leonardo Bruni, Filelfo, Valla and Ficino, was perfected by the work of Montaigne, Bruno and Gassendi and exerted wide influence upon many developments of modern philosophy. The influence of Epicureanism upon naturalism and modern rationalism is evident in the materialistic metaphysics of

Hobbes, La Mettrie and d'Holbach, in Voltaire's battle against superstition and Diderot's against religious faith itself, in the naturalistic cosmogony of the *encyclopédistes* and in the modern doctrine of the social contract; but above all it is revealed in the philosophers who move in the orbit of sensationalism, of utilitarianism and the theory of progress. They depart somewhat from Epicurus, however, in insisting upon the fruitful efficacy of the passions, which Epicurus like the stoics wished to repress, and in passing from the individualistic bonds of Epicurean friendship to those universal ones of society and all humanity, denying Epicurus even his reserve of prejudice regarding barbarians and slaves. In education Epicureanism is important not only for its stress on the exercise of equal cultural rights by women but for the declared reciprocity of the educative relationship between teacher and pupil, which is also characteristic of the idealistic pedagogy of Fichte. By such reciprocity, which is also the basis of friendship, utilitarianism attained in Epicurus the capacity—which it loses afterwards in Hobbes, but regains in Helvetius, Bentham and John Stuart Mill—of laying the theoretical basis for the transformation of egoism into altruism and the formation of the conscience, interpreted as the creation either of an inward mentor and judge or of an impartial and disinterested spectator.

EPIDEMICS. One might expect that the memory of the sudden onset of a universal sickness would become deeply incorporated in the traditions of primitive peoples; but since the greatest pandemic of modern times, the pandemic of influenza in the year 1918, has left no permanent memorial of its ravages in India, where it caused over seven million deaths in the space of two months, the scanty information regarding ancient epidemics is not surprising. The first extant account of epidemics during the period of antiquity is contained in the *Hippocratic Collection*, which described in some detail the Periclean bubonic plague of 429 B.C., the typhus plague of Athens in the time of Thucydides, malaria and influenza. The chief epidemiological event of which there is any record during the dark ages in Europe is the bubonic plague in 543 A.D. in the reign of Justinian. The outstanding epidemic during the mediaeval period was the Black Death (*q.v.*), which decimated Europe in the fourteenth century. The accounts of epidemics become more numerous and more detailed in modern times but owing to the absence of scientific methods of observation and induction they are not very informative. In England, for example, influenza, malaria, relapsing fever, typhus and certain forms of plague were classified symptomatically as "pestilential," "putrid," "malignant" or "nervous and comatose" fevers; smallpox was not clearly differentiated from measles and scarlet fever, while the nature of the "sweating sickness" of the fifteenth century was and is still unknown. The records furthermore are suspect on account of the metaphysical outlook of the observers as well as by reason of their rhetorical language and their slavish adherence to the letter rather than to the spirit of ancient Greece. As the result of the great advance made by medical science during the latter half of the nineteenth century it is now clear not only that the number and variety of human pestilences is far greater than would be inferred from the scanty records of preceding ages but that scarcely a year elapses in which some considerable portion of the world is not the scene of a fulminant epidemic. It is justifiable to assume, since such diseases as plague, influenza and typhus have always exhibited a remarkable fixity of type, that epidemics have not materially changed in character.

The brilliant achievements of medical science during the past half century have not, however, been associated with a corresponding increase of knowledge in regard to the genesis of pandemics and epidemics. Among primitive peoples epidemics were and still are attributed to malignant spirits or the displeasure of an offended deity. The first attempt to provide a more reasonable and reasoned explanation of their origin was made by Hippocrates, who observing the sudden and almost simultaneous emergence of epidemics over wide areas was led to attribute an important part in their causation to perceptible changes in the physical properties of air, the secular oscillations of which, in response to cosmic influences, were regarded as the cause of periodic variations in the incidence of disease. This theory, termed the theory of epidemic constitutions, was revived and extended by Sydenham, who held that during an epidemic epoch all diseases tended to conform to the type of the "reigning" epidemic. He attributed cyclical and seasonal variations in the incidence of disease to occult instead of to perceptible changes in the atmosphere. It was later assumed that earthquakes and volcanoes, as well as celestial phenomena, played a significant part in the causation of epidemics; and the miasmatic theory, a modification of the theory of epidemic constitutions, was propounded, which postulated that epidemics were due to the corruption of the atmosphere with noxious effluvia generated in damp and polluted soil. In the middle of the nineteenth century von Pettenkofer put forward the view that the seasonal character of epidemics was occasioned by changes in the level of the subsoil water, which, it was assumed, caused the expulsion into the atmosphere of the germs of disease contained in contaminated soil.

The miasmatic theory held the field until the close of the nineteenth century, when, as the result of the new impetus given to epidemiological speculation through the discovery of the parasitic nature of disease, it was supplanted by the theory that epidemics were the outcome of biological changes of the specific parasite. According to this theory adverse circumstances affecting man or his environment periodically and temporarily enhanced the virulence and infectivity of epidemics. This theory, termed the biological modification theory, therefore postulated that epidemics were due to changes affecting the quality of the germ. In order to account for the rise and fall of the epidemic wave the hypothesis was advanced by W. Hamer

and others that epidemics were occasioned by the association of the specific parasite with an ultraviolet virus. Some support was lent to this view by J. Brownlee, who reviving the suggestion of William Farr that epidemics follow mathematical rules demonstrated the close resemblance of epidemic curves to the normal curve of error, from which he was led to conclude that the infectivity of specific parasites underwent fluctuations in accordance with mathematical laws. The pandemic of influenza in the year 1918 was responsible for the resurrection of the theory of epidemic constitutions by W. Hamer, F. G. Crookshank and others. W. W. C. Topley and M. Greenwood and others in England, as the result of the study of artificial epidemics in mice, and L. T. Webster in the United States were able to throw new light on certain obscure aspects of human epidemics.

In opposition to the view that epidemics are primarily the outcome of biological modifications affecting the quality of the germ, S. F. Dudley in 1923 concluded as the result of his study of an epidemic of diphtheria in a closed community that most of the features exhibited by epidemics may be dependent upon a constantly changing relation between man and his parasites and the efforts of both to adapt themselves to each other. C. A. Gill in 1914 had reached the same conclusion in respect to epidemic malaria. As a result of a detailed study of epidemics in India he has contended in *The Genesis of Epidemics* that all types of epidemics can be explained in terms of a quantitative change in the relationship of the infection quantum, or dose, and the immunity quantum, or resistance. This theory, which is termed the quantum theory, postulates that three factors are concerned in the mechanism of epidemics and pandemics, viz. the human factor, the parasite factor and the transmission factor. Special importance is attached to the last factor since the emergence of an epidemic is held to be dependent upon a sudden increase of the infection quantum, which can occur only when the environmental conditions are favorable to the rapid transmission of infection. The characteristic features presented by epidemics—cyclical and seasonal periodicity, diffusibility, toxicity, intensity and the age distribution of mortality—become explicable in terms of a quantitative change in the infection and immunity quantum. The part played by climate and environment in determining the occurrence of epidemics is in large measure referable to the influence of at-

mospheric temperature and humidity upon the specific parasite and its carrier during its extracorporal phase. The close relationship existing between wars and famines and epidemics is attributed to the fact that the aggregation of large bodies of men under unfavorable hygienic and economic conditions necessarily occasions in the absence of precautions increased exposure to infection and lowered resistance to disease. The quantum theory, which appears to explain the causation of all types of epidemics—pandemics, regional epidemics and localized epidemics—marks a partial reversion to the theory of epidemic constitutions. It postulates, unlike the biological modification theory, a unitary mechanism of epidemicity; it envisages atmospheric states and environmental conditions as playing through their influence upon transmission an important part in determining the emergence of epidemics; and, since long term fluctuations of climate are known to occur as the result of extramundane causes such as sun spot cycles, it envisages a change in the constitution of disease as in some measure determined by extramundane influences. The accuracy of the quantum theory has yet to be substantiated, but it is no longer permissible to regard epidemics as catastrophes descending like bolts from the blue upon an unprepared and unsuspecting world. They must rather be regarded as the results of the working of natural laws governing infection and immunity, a full knowledge of which will rob these scourges of their terrors and enable them to be effectively combated if not prevented.

The influence exerted by epidemics upon human psychology and upon sociological and economic conditions has always been considered to be very profound. The appearance in 1348 of the Brotherhood of the Flagellants, and the dancing manias which spread widely in Germany and the Netherlands in 1374 are usually thought of as effects of the Black Death. As the combined result of the depopulation and migration occasioned by the plague large tracts of land went out of cultivation, trade was paralyzed and wages rose. Authorities now question, however, whether the Black Death occasioned social disturbances, economic changes and moral degradation to the extent that is ascribed to it. Similar but less conspicuous effects have been attributed to other pestilences. But in modern times the reactions of communities to epidemics, especially in civilized countries, only partially bear out the generally accepted views in regard to

their sociological effects. Perhaps because these visitations are still regarded as due to divine displeasure, their onslaught is marked by extreme humility and patience. In afflicted households an uncanny silence, only broken by the ceremonial wailing of women and the beating of breasts, is often the only outward sign of the prevailing misery. Life goes on as usual in the neighborhood and funeral processions wending their way almost unnoticed to the burial ground and the burning ghat may be the only indication of the tragedies of the epidemic. During severe epidemics some measure of hardship results from the temporary failure of the food supply, the disruption of trade, the interference with agriculture and the interruption of traffic; but even the most virulent pestilence is short lived and these ill effects disappear with astonishing rapidity and with them all memory of the epidemic. Nor are epidemics often the proximate or remote cause of civil strife. It is noteworthy, however, that the baiting of the Jews at the time of the Black Death had its precise counterpart in India in 1907, when political agitators took the opportunity of a great epidemic of plague to spread the rumor that the British government was poisoning wells with the object of thinning the population.

The effect of pestilence in causing depopulation is not always of permanent consequence. Such is the recuperative power of the highly fertile people of the Punjab, for example, that although during the past twenty years great epidemics of plague, malaria and influenza have destroyed over 6,000,000 in this province with a population of 20,000,000 in 1921, the loss has been met by a large natural increase of the population, sometimes half a million a year. It might be inferred that this great destruction of life must at least have exercised a baneful effect on the economics of the country. But since the brunt of epidemics is usually borne by children and old people, the survivors of an epidemic, who are mainly breadwinners, have in consequence of the epidemic fewer dependents to support. Epidemics are therefore sometimes followed by a temporary rise in the standard of living. A more serious effect of an epidemic plague arises out of its peculiar liability to attack females of childbearing age, as the result of which the sex ratio of the population in the Punjab has undergone a change and males now outnumber females by 2,000,000.

Even if the psychological, sociological and economic effects of modern epidemics are less

conspicuous than might have been anticipated, it is not permissible to regard this crude method of adjusting man to his environment as an unavoidable and inevitable calamity or to hold that it is not necessary to devise more humane means of providing for a large natural increase of the population. The reaction of modern man to epidemic visitations differs from that of his less enlightened predecessors in the fact that he is attempting to prevent them. The medical history of the nineteenth century indicates that the science of preventive medicine owes much to the spur occasioned by great epidemics. It was, for example, the first recorded outbreak of cholera in England in the year 1831 that was responsible for the formation of central and local boards of health, a small beginning from which sprang the sanitary reforms that have transformed England and added greatly to the health and welfare of its people and of the world. Similarly it was the outbreak of plague in India at the commencement of the present century that led to the appointment of a commission whose researches have made available assured methods of controlling this disease. An epidemic of yellow fever was responsible for the creation of the Reed commission, whose achievements constitute a notable advance in preventive medicine. It was a great epidemic of malaria in India in 1908 that led to the intensive study of malaria epidemics. The great pandemic of influenza in 1918 was responsible for a revival of interest in epidemiological science and for stimulating the prosecution of researches into the genesis of epidemics which may eventually enable medical science to obtain complete mastery over them.

EQUAL PROTECTION OF THE LAW. Class legislation is an integral part of the jurisprudence of any truly aristocratic society, but it persists even in an equalitarian society. It must not be supposed that when the doctrine of equality emerged in the late eighteenth century it meant the repudiation of all class legislation. In early American state constitutions there are high sounding statements of the philosophy of equality side by side with property and religious qualifications upon voting and officeholding, while the statute books retained many relics of the class legislation of an earlier day. Free and pioneer America, however, was not a place in which class distinctions in the law could long withstand the burning force of the ideal of equality so nobly stated in the Declaration of Independence. Class legislation affecting the right to vote and hold office, affecting the rights and privileges of servants and masters and affecting in various states the preferred status of an orthodox religion disappeared for the most part in the early nineteenth century. The slave alone remained, a challenge to the sincerity of the professed abhorrence of vicious class legislation, a legal and social enigma to be resolved only by civil war. When as a result of it the slave was freed, he was guaranteed equality of civil rights under the constitution by the Fourteenth Amendment, which contained a clause forbidding any state to deny to any person within its jurisdiction the equal protection of the law.

The equal protection clause was the first specific and verbal recognition of the doctrine of equality in the federal constitution. There is no similar clause limiting the powers of the federal government. Does it follow from this that Congress is under no restraints with respect to the

enactment of class legislation or discriminatory measures? Or does the more general guaranty of due process of law include within its scope protection against arbitrary discrimination? There is respectable authority for the view that due process includes equal protection of the laws—Cooley and Mott may be cited in its support—and it has been pertinently urged that there are no state cases in which there has been any protection extended under the equal protection clause which could not be claimed under due process of law. In 1921, however, Chief Justice Taft in the case of *Truax v. Corrigan* [257 U. S. 312 (1921)] drew a distinction between the two guaranties. While admitting that due process includes a certain fundamental equality before the law he declared that the equal protection clause provided relief from types of discrimination to which due process could not extend. This doctrine was dictum in the case and has not escaped criticisms, the most cogent of which consists in emphasizing that no court has yet shown concretely just what equal protection actually adds to due process of law. The relation between the two clauses remains therefore debatable ground. Nevertheless, equal protection of the laws provides a textual criterion by which class legislation can be tested and invalidated and it embodies our main constitutional protection against legal discrimination. Most of the state constitutions contain clauses similar to the equal protection clause of the Fourteenth Amendment.

Equal protection of the law does not prevent classification in the law. Classification is necessary to all law. Equal protection, however, does provide a test for classification. It requires that classification must be reasonable and not arbitrary. When the law creates classes, those classes must substantially differ from one another; those differences must have some reasonable relation to the purpose of the law, and the classes created must include substantially all those who stand in a similar position with respect to the law. Furthermore, the basis of classification must be one which may reasonably be made the subject of legislation. In applying these standards to legislation the courts have not overlooked the practical problems which confront the lawmaker and administrator. Classification may proceed in good faith along practical lines and is not required to meet tests of mathematical accuracy. In upholding against the charge of discrimination an act requiring employers engaged in mining or manufacturing to pay wages in lawful money or its equivalent the Supreme Court

speaking through Mr. Justice Holmes said: "It is established by repeated decisions that a statute aimed at what is deemed an evil and hitting it presumably where experience shows it to be most felt, is not to be upset by thinking up and enumerating other instances to which it might have been applied equally well so far as the court can see" [*Keokee Consolidated Coke Co. v. Taylor*, 234 U. S. 224, 227 (1914)]. So also it is held permissible to create classes or groups upon the basis of numbers or size even though those just inside and just outside the lines of such classes occupy very similar positions.

It was the undoubted intention of the framers of the Fourteenth Amendment that the equal protection clause should afford adequate protection for the newly freed Negro against discrimination based on his race and color. In the *Slaughterhouse Cases* [16 Wall. 36 (1873)] Mr. Justice Miller expressed doubt that the clause would ever be invoked save in cases of race discrimination. Obviously, the clause has not been so restricted in its application but has been applied generally by the courts to all legislative classifications. In fact, the intentions of the framers of the amendment with respect to the application of the equal protection clause to the Negro have been in large measure defeated by judicial interpretation. The Supreme Court has held that the equal protection clause restricts only the states and not individuals, so that it affords no relief to the Negro from discrimination practised by individuals [*Civil Rights Cases*, 109 U. S. 3 (1883)]. Furthermore, the Court has held [*Plessy v. Ferguson*, 163 U. S. 537 (1896); *Berea College v. Kentucky*, 211 U. S. 45 (1908)] that race is a proper basis of classification with respect to the enjoyment of accommodations on common carriers, in inns, restaurants, places of amusement and public schools. Segregation of the races in respect to such privileges has been upheld as a legitimate exercise of the police power of the state as long as the separate accommodations required are substantially equal. On the other hand, segregation of the Negro through municipal residence ordinances received a setback from the Supreme Court in *Buchanan v. Warley*, 245 U. S. 60 (1917). Although race is not a proper ground for classification with respect to suffrage or the enjoyment of political or civil rights such as jury duty and the like, the states in the south have succeeded largely in disfranchising the Negro through the operation of general laws. The equal protection clause has

also been held available in cases of discrimination against aliens in private employment [Truax v. Raich, 239 U. S. 33 (1915)].

The principle of class legislation has come to have a new and important application to the problems of social and economic life. The individualism of the early nineteenth century with its doctrine of laissez faire was hostile to the growth of class legislation applicable to labor or capital. Government was to umpire the game impartially, not to dispense privileges nor impose handicaps. But with the enormous expansion of industry and the rise of the wage earner there emerged in American industrial life economic classes which were not equal and which stood in need of protection against the consequences of their unequal bargaining power. Gradually the state of necessity intervened through its police power and enacted laws to secure to the laborer reasonable working hours, safe and sanitary working conditions and other necessary protections which he had been unable to secure for himself. At the outset judges and theorists of the individualistic school attacked this protective labor legislation as a reactionary return to class legislation which treated the laborer as one who was legally not quite self-sufficient but must be made the beneficiary of special guardianship. Those who had been brought up in the dogma of Sir Henry Maine that "the movement of progressive society is from status to contract" deplored the growth of a governmental attitude which returned the working man from his position as a free bargaining agent to a "status" in which he is surrounded by the special protection of the law. And on these grounds many early labor laws were held void as denying the equal protection of the law. Gradually, however, this view was abandoned in favor of the theory that class legislation in behalf of an exploited class may be necessary to restore the essential equality of classes which is desirable in a healthy society. Early class legislation had been indefensible since it sought the exploitation of classes and made existing inequalities permanent. Modern class legislation may be defended when its aim and result are essential equality.

The whole modern drift both in the United States and in foreign countries is toward an increasing differentiation of classes and a recognition of their special needs and opportunities. As long as the groups singled out are vitally different and as long as their protection or repression bears a reasonable relation to the general welfare,

the special laws for their regulation are defensible and desirable. But the conferring of special privileges or the imposition of peculiar burdens which cannot be so defended are now recognized to be contrary to sound political and economic theory and in the United States at least to be unconstitutional.

EQUAL RIGHTS. *See* FEMINISM; EQUALITY.

EQUALITY. Like all great political abstractions the notion of equality bears rich associations with the complexities of human life. For many men these associations have changed a concept which to the logician appears an absurdity, or at best a problem, into a simple fact of experience. Since the historian is more apt than the logician to be aware of the windings of human desire, historical description had here better precede logical analysis.

Modern knowledge of primitive societies is sufficient to make generalizations about equality in prehistoric times very difficult. The once widely held notion of an actual golden age of communistic equality is dead. Primitive societies doubtless displayed as much variety in the status of the individual in respect to equality as in respect to property and family. Where there was a lack of differentiation in economic function, as among poorer peoples, there must have been a rough economic equality. But tribes in British Columbia display a considerable range of private wealth; and in certain Melanesian tribes rank depends on membership in secret societies, which can only be bought by wealth. As for political inequality the chiefs of most North American tribes were chosen democratically and lived in no better state than their followers. An African chieftain, however, was a definitely privileged person. The great empires of antiquity—

Egypt, for instance—were completely stratified societies. In the East the caste system took final hold in India; in China, although the career open to talents was provided for in the mandarin system, society was hardly egalitarian in any sense. Buddhism does involve the equality of men before God and especially in its early proselytizing and reforming period was animated by an ideal of social equality, but in general the history of egalitarianism finds little material outside Europe.

To Athenians of the fifth century, however, equality meant almost what it does to the modern age. This truth has been somewhat obscured by four factors: the fragmentary character of our sources for political theory prior to Plato and Aristotle; the prestige of these latter thinkers, both of whom denied human equality in its more obvious senses; the existence of slavery at Athens; and, finally, the credit given the partially valid generalization that true individualism, the best foundation for egalitarian ideas, did not arise in Greece until the Hellenistic age. Yet in spite of all these qualifications it remains true that the notion of human equality, like so much of the ethical coloring of our politics, is found in Periclean Athens. Herodotus is emphatic on the contrast between irresponsible Persian rule and Greek *isonomia*, equality before the law. Athenian *isotimia*, equal respect for all, and *isegoria*, equal freedom of speech and hence of political action, together with that regard for equality of opportunity so evident in Pericles' funeral speech make up a conception of equality not unlike that of the early, hopeful days of the French Revolution. Such equality does not of course imply economic equality, nor does it even assert the fundamental identity of human nature. Traces of this latter doctrine are not, however, lacking. The sophists often denied the absolute distinction between freemen and slaves, and Antiphon went so far as to assert that Greeks and barbarians were not wholly unlike. Lycophron is asserted by Aristotle to have denied the existence of any distinctions between men at birth thus anticipating Locke and the modern behaviorists. Euripides attacked the unequal status of women and Plato, not otherwise an egalitarian, maintained men and women to be psychologically alike.

Athenian ideas of equality, however, are scarcely more than in embryo. Their fuller development occurred under the influence of stoicism, Roman law and Christianity. For the stoic the possession of reason marks men off

from the external world. But reason works in uniformity with itself. That part of one man which reasons, his soul, must therefore be like the reasoning part of any other man. Men are as men, not as animals, identical. From this metaphysical basis certain stoics advanced to astonishingly radical assertions that in this world of fact men are really alike. Cicero's "*Nihil est enim unum uni tam simile, tam par, quam omnes inter nosmet ipsos sumus*" is as thoroughgoing an assertion of the rationalist idea of equality as has ever been made. At this point the fact of social and economic inequality arose to confront the stoic. Roman law afforded the solution. Administrative necessity had long forced on Roman lawyers a distinction between their own local uses and the uses of other peoples. By observation they had found certain common elements, certain fundamental but naturally rather abstract principles, which they called the *jus gentium*. The universality of these principles appealed to the stoic mind, which soon mixed them with rationalist ethics to make the *jus naturale*. Men were alike by natural law, unlike only by their failure to obey that law. Once long ago in the state of nature they had enjoyed practical equality. As to why men had fallen from the state of nature the stoics are of course no clearer than any other speculators on the origin of evil. The duty of the good man, however, is clear: to treat all men alike, to obey the law of nature as reflected in his own reason, to bring that law before the minds of his fellows.

Christianity asserted from the first the equality of men before God. "There is neither Jew nor Greek, there is neither bond nor free, there is neither male nor female; for ye are all one in Christ Jesus" (*Galatians* III: 28). In the primitive church there was unquestionably something like a communistic equality of goods. But even here the emphasis is not on a productive communism of this world, but on the loving participation of spiritual equals in whatever goods their special positions or capacities had endowed them with. To share in God is to share in an Absolute where more or less is inconceivable. In the patristic writings of the fourth century there is discernible an approach toward stoic rationalist ideas of the equality of man. But the triumph of the Augustinian doctrine of predestination definitely stopped the development of this stoic-Christian synthesis and established what was to be mediaeval orthodoxy on this subject. According to it worldly inequality is a part of the divine scheme of things, the consequence of a fall

willed by God and utterly different from the stoic law of nature.

Mediaeval thought, that of St. Thomas Aquinas, for instance, although it maintains the Christian dogma of the spiritual equality of men in the eyes of God, denies that men are equals on earth. Feudal organization suggested an organic view of the state, where quite different men perform different functions for different rewards; and church traditions suggested a patriarchal view of the state, where the unequal sufferings of men followed as punishment for original sin and where clergy and nobles, as God's lieutenants, protected the lower orders. Yet the Middle Ages hardly achieved in fact this social equilibrium; and even orthodox doctrine holds that Christianity exists to combat the consequences of original sin, among which are merely worldly inequalities. The world may be denied, and then the solution is quietism or monastic asceticism; or the wicked world may be combated, and then the solution is heresy. Much mediaeval heresy, like that of the Hussites and the Lollards, is mixed up with the demand for something nearer to social and political equality. The complex currents involved in the three possibilities—acceptance of a hierarchical society, ascetic refuge from that society, revolt against that society in the name of equality—are all present in a movement like the Franciscan.

There have always been of course simpler demands for equality, demands not necessarily clothed in ethics or metaphysics: notably the desire usually attributed to democracies for a leveling of social habits—dress, taste, morals—and the desire of the poor to pull down the rich. If we may believe Aristophanes, the Athens of Cleon was jealous of social distinction and both classical antiquity and the Middle Ages witnessed slave revolts and *jacqueries*. Yet these latter were almost always revolts of despair, without a program and without influence, save perhaps for the Peasants' Revolt in England, which left behind it the egalitarian tradition of John Ball.

The Renaissance, since it was a period favorable to the flowering of individual differences, might seem at first sight hostile to equality. But its ultimate results in politics advanced that principle in some of its applications. Absolute rule of the prince leveled those below him and thus undermined the hierarchical system of relationships, paving the way for democracy. Modern ideas of equality were further and profoundly affected by Calvinism, politically the most significant form taken by the Reformation.

In reenforcing the notion of predestination, of the sinfulness of man, of the incommensurability of God's scheme and man's, Calvinism strengthened the notion that human inequalities cannot be remedied. Moreover, according to the school of Weber, it was largely responsible through its emphasis on labor, on saving, its removal of the mediaeval prohibitions of interest and its hostility to the mediaeval organic state for the growth of modern capitalism. On the other hand, Calvinism broke down completely the mediaeval distinction between laymen and clerics; it applied its rigorous moral code to all without distinction of rank or wealth; and in its extremest forms, as in the England of Cromwell, it imposed an extraordinary social uniformity on all alike. The English Revolution did produce, in the Leveller movement, a class conscious group armed with a program of economic equality. The Levellers, however, cannot be fathered wholly on Calvinism; they are simply an example, like the Anabaptists of Münster, of a discontented group rising to the top in times of violence and drawing arguments for equality from the teachings of Jesus.

The eighteenth century saw the complete formulation of the modern doctrine of equality, as the first century B.C. had seen the formulation of the ancient doctrine. The philosophers of the eighteenth century were living in a world something like that of the stoics: it was a cosmopolitan world, a world where the conflict of sects had ended in a fashionable rationalism, a world of much humane feeling and much actual suffering. And of course the *philosophes* had before them the works of their Greek and Roman predecessors. But there are three elements in this modern notion of equality not wholly discernible in the ancient. First, physical science supplied the essential metaphysical basis, the concept of a real uniformity behind apparent diversity. The law of gravitation rather than the law of nations provided the model for the political reformer. The true laws of politics must be simple, like all good scientific laws. They could not be simple unless the entities with which they dealt—men—were assumed to be identical. Bentham's felicific calculus could hardly have been applied save to units with a like capacity for feeling pleasure and pain. Second, the powerful and recently enriched middle classes, especially in France and England, were anxious to achieve social and political equality with the nobility. Third, the notion of an actual previously existent state of nature, to the stoics hardly

more than a logical haven for their rationalism, became with Shaftesbury and Rousseau a belief in the natural goodness of man, a belief held with a mystic fervor rarely attached to so worldly a dogma. All these elements went into eighteenth century egalitarianism: reason and faith both showed men to be identical at birth; if they were now unlike, the cause must be sought in something outside them—their environment; but that environment could be manipulated, as the science of Newton had shown; if men were treated alike, they would become alike. The American and the French revolutions finally established as part of a creed the proposition that all men are born equal. Jefferson's phrase and the famous *Liberté, égalité, fraternité* entered into the ritual of the two great nations and acquired thereby something more and less than meaning.

Throughout the nineteenth century the concept of equality stood in the background of a great variety of social movements and proliferated into an increasing number of fields. A detailed history of its development would touch upon most aspects of modern life. It will therefore be well to abandon the historical treatment of the subject at this point and attempt a systematic analysis of the possible meanings of equality which have been of importance.

First, there is equality of opportunity, the career open to talents. Men are born with quite different capacities, but for that very reason they should be given an equal chance to bring out what is in them. In this sense equality is merely a common sense accompaniment of individualism. But here enters a serious difficulty. It is clear that the son of the millionaire and the son of the laborer do not get equal opportunities. The social environment must be altered if one wishes to provide an equal start for everyone, and this can hardly be done except by collective action. The logical conclusion to be drawn from the principle of equality of opportunity is not *laissez faire*, but collectivism. The still numerous believers in this form of equality are, however, rarely logicians.

Then there is equality before the law, equal administration of justice. This principle does not necessarily assume that men are in any tangible way alike. If there lies in its background an ethical feeling for the dignity of human beings, a feeling that man must always be treated as an end, not as a means, its foreground is a desire for practical administration of justice. There is, no doubt, a reciprocal influence of highly developed

systems of law on ethical ideas, and Roman lawyers ended by regarding the human stuff with which they worked as well as the rules by which they worked as equally abstract. In the modern world the struggle for this sort of equality began in England in the seventeenth and in France in the eighteenth century and was directed largely against royal and noble privileges and exemptions. In the United States popular feeling has always regarded wealth as the chief obstacle to equal administration of justice. Much of the bitterness of the antitrust movement came from the popular belief that corporate wealth in particular possessed unfair advantages in the courts. Election of judges, even recall of judges, has been regarded as legitimate means of protecting the independence of the courts. Historically the struggle for equality before the law is tied up with trial by jury, with habeas corpus or similar devices, with the independent tenure of judgeships. This machinery and its operation are, however, less important to the effectiveness of the principle than may seem at first sight. At present the principle is accepted, if not realized, in all civilized countries.

Political equality is a more complex matter. It may be merely a spiritual consolation, the secular equivalent of religious equality in God. A good Frenchman shares in the republic of France as a good Christian shares in the kingdom of heaven. Or it may go so far in the direction of concreteness as to aim at something like social and economic equality. In practise the ideal of political equality has centered in universal suffrage and representative government—modern democracy, in short. The philosophic explanations of this principle of "one man, one vote" have a considerable range. It may be asserted that, although men vary greatly in political wisdom, there is something absolute in the fact of being human that gives man a right to a voice in government. It may be asserted that at any rate each man knows what is best for himself—this is Bentham's position—and that in a vote the majority is apt to take the wisest course. Finally, it may be held that although men have different abilities in their special occupations, quite ordinary men are possessed of good political judgment; therefore, although a majority vote of ordinary men could not be trusted to judge a musical composition, it could be trusted in a matter of foreign policy. A variant of this notion maintains that ordinary men have at least the capacity to select wise representatives. It has been found necessary to multiply devices and

machinery for obtaining political equality as older methods reveal abuses and failure to achieve tangible results. The direct primary and the initiative, referendum and recall were all regarded at one time as necessary to complete political equality. Of recent years there has been a reaction against such machinery, even where, as in the United States, certain British dominions and Switzerland, it has been most fully developed; and an increased tendency to trust in the expert, as in the city manager plan, the growth of special administrative bodies and the extension of the civil service. Government by experts is with difficulty reconcilable with the idea of political equality.

Ideas of social equality have worked out into concrete forms in several different directions. They had an influence in the humanitarian protest against slavery. They find expression in protests against the aristocratic principle. They animate the struggle for racial equality and constitute one of the goals of those who seek sex equality. Although there is precedent for sex equality in Plato and in the later Roman lawyers, the full extension of the idea is essentially modern. The extent to which the feminist movement has gone is indicated by the fact that in the recent attempted revision of the Anglican prayer book the elimination of *I Corinthians* XI: 1-16 ("... the head of every man is Christ: and the head of the woman is the man . . .") was almost carried. Some feminists are content to admit important psychological as well as physiological differences between men and women and consequent differences in status. For them political and legal equality with men is sufficient. Others assert that men and women are fundamentally alike in almost all forms of human activity and that given equal opportunity women can do all that men can do in art, letters, business and administration. Women have already acquired the suffrage in most of the western world and in the United States perhaps something more than legal equality with men; even socially and economically they start out at present on something like an even basis with men. But although common masculine opinion is far less certain than it was fifty years ago that there are indelible feminine traits, the doctrine of the psychological identity of the sexes is still a radical one.

Race equality is partly a doctrinal concept, partly a matter of social arrangements. In both aspects it has played an important part in the history of the nineteenth century. Gobineau, H. S. Chamberlain, Lapouge, Ammon and many

others gave doctrinal form to nineteenth century race prejudices. The content of their doctrines varied somewhat, especially with the name of the elected race—Aryan, Nordic, Caucasian, Latin—but their outlines were the same: race differences in human beings are so great as to be virtually differences between species; one race is much superior to others, especially in intellect; mixture of races invariably produces inferior offspring; Darwin has shown that the superior race is the product of evolution, that it is fittest and should prevail over other races, perhaps by their eventual extinction, certainly by their complete political subordination. That peoples were only too willing to act on these assumptions almost any bit of modern history will show. The position of the Negro in the United States is an excellent type problem. In practise it is still almost universally assumed that the Negro is an inferior, and the laws of the southern states make this inequality explicit. As to the two essential points in a theoretical consideration, the ability of the Negro to live the same sort of life as the white man and the results of race mixture, most contemporary anthropologists would answer that in so far as scientific methods can test race differences we can only say that the evidence is too incomplete to permit generalizations. Some, like Hertz and Finot, deny the existence of inherent race differences, especially intellectual differences. On one matter at least all are agreed: "pure" races do not exist. Especially in Europe historical processes have built up nations from extremely mixed stocks.

A number of factors have contributed to the partial translation of theoretical doctrines of race equality into at least a limited practise of social equality. Nationality although in the last century it leaned heavily for support on race theories is ultimately based on some sort of general will or consciousness. Equality of nations is a matter of international law, and the tendency of nationalism has been to promote social equality. Nationalism in modern times grew out of the French Revolution and therefore had from the beginning an egalitarian cast. Precisely because the racial identity of the members of the nation state was so doubtful, emphasis was put on their spiritual and cultural identity. A Frenchman, for instance, should be, externally at least, as much like other Frenchmen as possible. The French Revolution was notably hostile to provincial differences in costume, dialect and habits and sought by education and administration to unify France.

This sort of social equality within a given nation is closely connected with democratic leveling and with the rule of the majority. As a tendency in American life it has roused to protest and literary activity a whole school of modern writers. Their fears lest all Americans become as much alike as so many smooth coins are somewhat exaggerated. Certain social conformities are indeed required in modern America, but not so many conformities nor such unchanging ones as in a primitive tribe or a religious sect. The vastness of the scale of our conformities has blinded us to the shallowness of their reach. Education has not eliminated local differences: a New York equivalent of cockney English has arisen in the last few generations, and not even the radio will spread it to the Kansan plain. Even fashion, which has now an international scope, represents a struggle between innovation and persistence, between individualism and egalitarianism, the result of which is always variety of some kind. Finally, no social equality could be complete without economic equality, and of the latter ideal there is little trace in modern America or indeed in the modern world.

If economic equality be defined as the absolutely equal partition of all kinds of wealth among all human beings, then it has found few defenders in the history of thought. Nothing could be more erroneous than to consider, as so many critics of socialism do, that economic egalitarianism is one of the distinguishing marks of any socialist system. Socialism of all kinds does indeed aim at doing away with poverty but it does not necessarily assert that men are alike or that they need or deserve equal shares of wealth. Among the many systems commonly labeled socialist some imply equal sharing in production or distribution or in both. Some content themselves with such formulae as "From each according to his ability; to each according to his need." But Fourier and Saint-Simon both repudiate equality of compensation; and even Marxism is concerned primarily with the rational organization of production rather than with the equalization of consumer's wealth. Moreover, the dogma of a dictatorship of the proletariat suggests, at least for a prolonged period of transition, the fixation of class lines. Robespierre gave expression to the ideal of economic equality which has come nearest to common acceptance in modern times when he said that no one ought to have much more or much less than 3000 francs a year. This rough equality was to be the result of public opinion, of the natural ethics of the commu-

nity and not of organized control. This is substantially the yeomanry ideal of Jefferson and as an ideal underlay the agrarian movements—granger, Populist, Farmer-Labor—of the last century in the United States. The industrial revolution has produced something more like economic equality than Marxian doctrine admits. The actual gap in consumer's wealth between Rockefeller and a workman is less than that between Croesus and a Lydian peasant. Only in articles having a snob or collector's value is great inequality the rule today. Moreover, on the side of capital wealth a great middle class, new at least in extent, has been built up. But poverty has not been eliminated, and from the point of view of distribution of control or power modern economic organization is tending toward the production of ever greater inequalities.

Behind all these senses of equality there lies the fact of individual self-consciousness and the consequent universal if vague demand for equality of personal valuation. In the past at least this has been true whether man was considered as a being distinguishable in essence from other animals, as with the Christians, or as an integral part of animal life, as with the eighteenth century philosophers. This demand has worked itself out in two main currents: the rationalistic concept of the essential identity of men and the religious-romantic idealization of an essential human element common to all men.

The rationalist asserts that men are equal in an empirical sense perfectly verifiable in this world. Common sense undoubtedly rejects this view; yet even to common sense it is obvious that the species man has less internal variation than, for instance, the species dog. The rationalist view is at bottom based upon a monistic solution of the epistemological problem of universals. It has been tremendously aided by the practical success of the concept of law or uniformity in government and in science. It probably represents a fairly permanent way of looking at things. It is at present, however, somewhat out of fashion. Economics, for instance, which long postulated in the *homo oeconomicus* a rationalistic abstraction, has found with the breakdown of *laissez faire* that this abstraction is no longer useful. The growth of experimental psychology has placed further emphasis on human variation. Yet even here the behaviorists have taken refuge in a position to which rationalists, faced with the evidence of experience, have always turned; namely, that differences in human beings are wholly the result of difference in environment.

Rationalist notions of human equality have probably never existed without some admixture of what we have called the religious-romantic idealization. This latter is a feeling, a given psychological fact, which it is idle to call irrational in a derogatory sense. It is at first hand allied with what the French Revolution called fraternity, just as the rationalist notion of equality is allied with another member of the triad, liberty. It is an agreeable emotion, for its realization promises peace. Probably it is never felt strongly save by uncommonly sensitive spirits. Yet there is no ground for thinking that it is not in an attenuated form a permanent element in human nature.

Neither the rationalist nor the romantic concept of equality is at present of great driving force in the western world. A rough equality before the law has been realized. Political equality has suffered from the prestige of the expert and the partial breaking down of parliamentary government. Economic equality as an ideal has failed to bite in. It has been displaced in large part by a belief in the fruits of a planned and hierarchically ordered economic scheme. In the United States the nineteenth century distrust of great corporate and individual wealth has almost disappeared. None but the intellectuals now dislike Henry Ford. In a superficial sense social equality has been attained to a degree which has alarmed men who consider individual idiosyncracies the charm of life if not the key to progress. Increasing standardization has been accompanied by decreasing egalitarianism. "Never were men so like one another," says Santayana, "and yet so divided."

A partial explanation of this paradox is to be found in the history of the idea of equality. In general the demand for equality has flared up strongly only when there was a marked contrast between the customary status of a group or groups of men and their actual status. The French Revolution is here the *locus classicus*: the middle classes were as rich and as well educated as the nobility but were in a position of definite social and legal inferiority. Their protest colored the whole of the nineteenth century. Similar situations have occurred at other points in history when equality was a motivating concept. Even the stoic-Christian ideal of equality was forged at a time when the contrast between the complexities of the inherited past of Mediterranean peoples and the simplicities of their cosmopolitan present were greatest. It is possible that the modern world is approaching some sort of social

equilibrium, possible that there are not enough of some kinds of equality to allay man's desire for ideal equality.

EQUALITY OF STATES. The idea that states should be considered equal in international law has influenced profoundly the theory of the law, and less significantly its practise, since the middle of the seventeenth century. Whether and to what extent mediaeval practise may have justified such an idea it is not par-

ticularly important to inquire. The theory was formulated by classical writers on the law of nations of the seventeenth and eighteenth centuries, particularly by those writers who acknowledged the unqualified supremacy of the natural law, and through them it passed into the literature and the practise of international jurisprudence.

The heritage of the classical writers from ancient and mediaeval learning included few notions more influential in the early development of the law of nations than the concepts of natural law, the state of nature and natural equality. With the disintegration of universal empire and the rise of the modern state system the application of these notions internationally was a tempting possibility. The sovereignty of the separate state was being increasingly stressed both in theory and practise. Actual relations between states were anarchic at best. The law of nations was an exceedingly primitive system. The concept of an international state of nature among equal states acknowledging no other supernatural authority than nature's law was for that age a plausible rationalization of the society of nations and international law.

It is significant that Hugo Grotius (1583-1645) elaborated no such rationalization. One of the most modern of the classical writers, Grotius was too much concerned with the development of a practical system founded upon usage as well as upon reason to be greatly interested in the perfection of such concepts. Among his successors, however, there appeared a school of writers, acknowledging the intellectual inspiration of Thomas Hobbes (1588-1679) and the leadership of Samuel von Pufendorf (1632-94), which conceived of international society as a state of nature, of international law as nothing more nor less than the law of nature applied to states in international society and of states as naturally equal. This was the origin of the modern doctrine of the equality of states. Burlamaqui left an especially lucid statement of the doctrines of this school in his *Principes du droit naturel* (Geneva 1748, new ed. Paris 1850; tr. by Thomas Nugent, 7th ed. Philadelphia 1832) and the same doctrines were taken over by the eclectics and given wider currency through the popular treatise of Vattel, *Le droit des gens, ou principes de la loi naturelle, appliqués à la conduite & aux affaires des nations & des souverains* (2 vols., London 1758, 3 vols., Paris 1856; tr. by C. G. Fenwick, Classics of International Law, no. iv, 3 vols., Washington 1916).

In the nineteenth century most writers reaffirmed the equality of states. Various descriptions as an attribute of states, a right of states or a principle governing their relationships in international society, its juridical significance was reappraised in terms of equality of rights or equality of capacity for rights, and much effort was expended in seeking to reconcile the principle with the inequalities in fact which seemed increasingly to characterize the international society of states. The principle was increasingly justified, in keeping with the tendencies of the time, as a necessary consequence of the sovereignty or independence of states. Of the few who denied or doubted the principle in the nineteenth century only Lorimer in his *Institutes of the Law of Nations* (Edinburgh 1883-84) was of first rate significance. There was reliance upon the principle from time to time in the decisions of national courts, in international awards and in diplomatic negotiations, although no precedent or accumulation of precedents can be said to have fully justified the broad generalizations of the writers.

It is difficult indeed to bring broad generalizations asserting the equality of states into harmony with the facts of international life. Some states are so organized internally as to make an equality of legal capacity difficult if not impossible of attainment. Other states are united externally in loose federation, confederation or imperial union with resulting limitations upon international capacity. Still other states are so limited by geographical position, as in the case of those having no access to the sea, or are so handicapped in their international relationships by the characteristics of their civilization, as in the case of eastern states until recently subjected to the extraterritorial system, that they are in no exact legal sense of equal status with other states in the international community. There have always been and probably will be for some time to come many states constrained to accept the more or less permanent protection, guaranty, neutralization or financial supervision of other states. When such relationships are established on a well defined and relatively permanent basis and are recognized by other states as a part of the international social order, they become a part of positive international law. It is unnecessary to add that they are inconsistent with the naturalist's conception of a natural society of equal states. Before the World War it was generally agreed that every state had a right of recourse to war.

Respected jurists even defined war as of the nature of an international action for the assertion or vindication of rights. In just so far as international law recognizes self-help as a lawful proceeding for vindicating rights and redressing grievances it concedes to states an inequality of legal capacity directly proportioned to the distribution of resources which make for military strength. Recent efforts so to organize the world that wars may be prevented and eventually outlawed have probably done more to establish real legal equality among states than centuries of juristic speculation could possibly accomplish.

Paradoxically enough, the principle of state equality has been a serious obstacle to effective international organization. It was formerly assumed that the principle would require equality of representation and unanimity in reaching all important decisions whenever states should organize for more effective cooperation; but respect for these assumptions would of course have made organized cooperation virtually impossible. In the seventeenth and eighteenth centuries there was no organized international cooperation, no law of international organization and consequently no occasion for distinguishing the legal from the political equality of states. In the nineteenth century the great European powers developed a primitive method of concerted political action which was denounced quite generally as a violation of the equality of states. In the latter part of the century a number of international administrative unions were created in which inequalities of representation, voting strength and financial support received a measure of recognition. Nevertheless, at the Second Hague Peace Conference in 1907 plans for organizing an international court of justice were wrecked by the insistence of the smaller and weaker states upon equality of representation. Where the nineteenth century condemned, granted reluctantly or rejected political inequality in institutions for international cooperation, the twentieth century has been constrained to accept it as an indispensable means to the more effective organization of the international community. In the League of Nations, the International Labour Organization and the Permanent Court of International Justice the political equality of states has been measurably subordinated to the end that legal equality may be more effectively conserved.

It may be concluded therefore that the equal-

ity of states, in the sense of equal protection of the law or equality before the law, is as indispensable in the international society of law as in any other legal society. Unless states are equally protected in the enjoyment of their rights and equally compelled to fulfil their obligations, whatever their condition or status, there can be no reliance upon law in international relations. Equality of capacity for rights, on the other hand, is at best an ideal in the system of international law. Among states so different in the fundamental physical bases of their existence it is unlikely that it will ever be perfectly attained. Finally, experience indicates that legal and political equality must be distinguished. Doctrines of equality which were appropriate enough in the seventeenth and eighteenth centuries defeat their own ends if applied uncritically in the more closely integrated and more effectively organized international community of the twentieth century.

EQUILIBRIUM, ECONOMIC. *See* STATICS AND DYNAMICS.

EQUITY. The words equity and equitable are most commonly associated by Anglo-American lawyers with the rules and principles of law which were developed in the Court of Chancery in England and in courts with similar powers in the United States. Like so many of the verbal symbols used by lawyers, however, these words have a variety of meanings, some popular and others more technical. The most common of the non-technical meanings of equity, one in which lawyers themselves not infrequently use the word, is as a synonym for "natural justice." In this sense to say that certain conduct or the decision of a court is equitable is merely a way

of saying that to the speaker or writer it seems fair or just. Even as a technical word in the lawyer's vocabulary, moreover, equity has more than a single meaning. Often in legal discussions it stands simply for a liberal and humane interpretation and application of law in general. It is in this sense that the *ἐπιείκεια* and *τὸ ἐπιεικές* of the Greeks are to be treated as signifying equity and equitable respectively. For example, this is the sense these words have in the passage in Aristotle's *Ethics* (bk. v, ch. x) commonly referred to in discussions of equity. Vinogradoff in his *Outlines of Historical Jurisprudence* (2 vols., London 1920-22, vol. ii, p. 66) writes that the appeal to *ἐπιείκεια* as a part of the unwritten law (*τὸ ἀγγραφον*) was a recognized procedure of great importance in Greek law. In Roman law the same general notion appears under various titles, such as *aequitas*, *aequum et bonum*, *utilitas*, *humanitas*, *benignitas*. Yet while *aequitas* in Roman law has at times this meaning, it was apparently used in a great variety of meanings. This is true even of a single writer, Cicero. Accordingly Buckland approves of Krueger's statement that the word "is of little use." Closely associated with these foregoing somewhat vague meanings of equity is that not infrequently found in English law in such phrases as "the equity of the statute." Upon examination it turns out that translated into plain English this means little more than that the statute in question is to be construed by the court so that its meaning will be in accord with what is believed to be, all circumstances considered, most convenient, reasonable or just.

Another meaning of equity, one made familiar to Anglo-American lawyers by the writings of Sir Henry Maine, is the one developed by him in his *Ancient Law* (1861) as a body of rules of law existing by the side of the original civil or "strict" law, founded on more or less distinct principles and claiming incidentally to supersede the strict law by virtue of a superior sanctity or ethical equality inherent in these principles. It is in this sense that the law developed under the Roman praetors is often called equitable. Probably the common statement that the edict of the praetor was the source of this kind of equity in the Roman law is only partially true and to some extent misleading. Apparently some of the doctrines often thought of as equitable were introduced by special acts of the supreme legislative machinery and not merely by the edict of the praetor. This was obviously law reform by legislation rather than by the devel-

opment of equity, unless indeed all reformatory legislation is to be called equitable. It should also be noted that the edict of the praetor was itself originally in a very real sense legislative in character; that is, it was issued by the praetor when he assumed office in the form of apparently fixed rules which he would follow. To this extent therefore the praetorian edict was a piece of express legislation by a single magistrate. On the other hand, the praetor never claimed a right to repeal directly the strict civil law rule, but merely devised means for avoiding its effects. Thus the praetor did not claim that he could openly confer ownership under an informal conveyance not complying with the formal requisites of the civil law; he could, however, protect possession and thus get around those requisites. In this respect the analogy to English equity is clear, as will later appear, and it is for this reason among others that the law thus developed by the praetor is regarded as equitable. One must, however, not lose sight of the differences between this so-called equity in Roman law and English equity. In the first place, the praetor professed to be guided by the set of supposedly fixed principles which he had announced in his edict, whereas the English chancellor, as will be seen, originally had a discretion to decide according to natural justice. The texts, however, show that the praetor was thought of as having necessarily because of his function a special leaning toward equity in its more vague sense of natural justice. In the second place, this Roman law equity was not developed and administered by a separate tribunal, as was the case in English law. In the third place, the procedure followed in the administration of Roman law equity was never claimed to be purely *in personam*, as came to be the case in English law. In the fourth place, some of the most important and characteristic branches of English equity have no real counterpart in Roman law equity. This is conspicuously the case with reference to the whole law of trusts and trustees as well as the doctrine of equitable conversion.

As is well known, in the course of time the praetor gradually came more and more to carry over almost entirely the edict of his predecessor, until finally the form became fixed soon after 125 A.D., when the edict as formulated by Julian under directions from Hadrian was given statutory force by a *senatus consultum*. The edict thus ceased directly to be a source of new equity law. After this date the development most clearly analogous to that of English equity in the Court

of Chancery went on in Rome through the settled opinions of the jurists. In the larger part of litigated cases the actual decision of the case was by a *judex* in accordance with the formula fixed by the praetor. As the *judex* did not need to be and apparently usually was not a skilled lawyer, it was inevitable that these opinions of the jurists should have great influence with the *judex*; indeed, to some extent they seem to have been regarded as binding upon the *judices*. It thus comes about that where an English or American lawyer would refer the court to a case previously decided by a court, the Roman lawyer referred to Papinian or some other great exponent of the law. Because of this the jurists in their commentaries on the praetorian edict succeeded in reading into it many novel propositions and thus became the main source from which the development of equity went on after the edict's form had become fixed. The jurists were thus responsible for perhaps the larger part of Roman equity. For example, by the strict law a contract right was not assignable. The jurists invented the idea that an assignment conferred a power of attorney upon the assignee to collect in the assignor's name and thus in effect although not in theory made the right assignable. In a similar way the jurists worked out such doctrines as subrogation, estoppel, constructive notice and the like. Another and often neglected source of Roman equity, according to Buckland, was the emperor, before whom cases might come in many ways and who rendered judgment in the form of a *decretum*. These decisions of the emperor, although made only after consultation with the lawyers who formed his council, were in the last analysis his own decision; at times they departed from the opinions both of the court which had (in the case of an appeal) tried the case and of the lawyers in the council.

It is common to associate the development of equity in English law exclusively with the office of the chancellor. In one sense this is correct but in another somewhat misleading, for after the development in the reign of Henry II of national courts administering law for the entire nation, the king's judges, who administered justice in his name, gave many kinds of relief which later could be obtained only in equity, that is, from the chancellor. The latter officer appears first in England in the reign of Edward the Confessor. He was the chief secretary, head of the king's chaplains and keeper of the royal seal. In the early days the office was always in

the hands of an ecclesiastic, because of the literary qualifications demanded. From the time of Edward I until Edward III the chancellor's power continued to grow; under Edward IV the Chancery became a separate jurisdiction, although not until 1474 did the chancellor make a decree on his own authority. If the actual legal developments after the Norman conquest are carefully examined, it will be found that common law and equity apparently originated as one undifferentiated system in the effort of the Anglo-Norman kings to carry out the duty ascribed to them to preserve order and to administer justice to rich and poor alike. Under the organization which developed, the individual who wished to take advantage of the king's justice had first to obtain the king's permission through the machinery provided by him. In the case of the common law actions as they were developed in the eleventh and twelfth centuries the essential characteristic was that they all began with a petition asking the king to interfere and to secure justice when it could not be obtained by the usual processes. In this way there developed the system of "original writs," issued out of Chancery, authorizing the king's court to hear the case. In the thirteenth century, as the older courts and the older system of law were gradually displaced by the newer system, the common law system came to be thought of as the normal law of the land. During all of this period, as already suggested, the king's courts were found administering not only the kind of remedies later associated with the common law but also many of those later known as equitable. To speak of common law and equity as existing at this time as separate systems would of course be to carry back into the twelfth and thirteenth centuries a distinction not then recognized. Gradually, however, a hardening process set in which limited the common law to a set of restricted forms of action covering fairly well defined types of cases. This was in large part due to the Provisions of Oxford of 1258, which forbade the chancellor to frame new writs without the consent of the king and Council. Prior to that statute great flexibility in the formation of new writs to meet new situations had existed. The limitation thus put on the powers of the chancellor was to some extent relieved by the 24th chapter of the Statute of Westminster II, which allowed the formation in the Chancery of new writs to meet cases more or less similar to those already provided for; but the hardening process had gone too far and the kinds of relief

obtainable had been narrowed too greatly for the common law to meet adequately the needs of a developing society. In most cases, for example, the relief given consisted of damages rather than specific relief. Naturally appeal was once more made to the royal prerogative and duty of administering justice. In the meantime the chancellor had become the chief law member of the Council as well as the most powerful executive officer of state next to the king. These facts and the added fact that the chancellor was usually a great ecclesiastic, learned in the canon and the moral law, brought it about that the petitions to the king or to the Council for justice in cases in which the king's regular tribunals were unable to function effectively began to be referred to the chancellor. Ultimately this became the routine procedure, so that by the middle of the fourteenth century the Chancery had come to be recognized as a separate judicial tribunal or court. One striking difference between Chancery as a court and the courts of common law lay in the mode in which cases were begun and carried on, or perhaps better in the theory which was supposed to underlie the process. To initiate a case in a common law court it was necessary to secure from the Chancery office an original writ. This writ, which ran in the name of the king, defined the type of case which the court to which it was addressed was directed to hear and decide and was thus the legal authorization from the king to his court to hear that particular kind of case and no other between the parties specified. In addition, the judgment did not ordinarily command the defendant to do anything but was simply that the plaintiff recover his damages. Failure to satisfy the judgment was therefore not contempt of court. In the case of Chancery, on the other hand, although it came to be regarded as a court, the chancellor continued to speak directly in the name of the king and the king's representative. On the presentation of the petition, or bill, as it came to be called, a writ was issued in the name of the king, under which the party complained against was directed to appear before the Court of Chancery to answer the complaint and abide by the order that might be made. This order also ran directly in the name of the king; that is, in legal theory it was the direct command of the king to his subject to do or to refrain from doing certain things. It followed that if the defendant disobeyed the order he was in contempt not of the chancellor but of the king and was dealt with accordingly.

The statement that "equity acts *in personam*" is based upon this form of procedure.

It is probably true that during much of the fourteenth century appeals for justice to the king through the chancellor were in many cases rendered necessary by the inability of the king's ordinary courts of common law to compel obedience from the more wealthy and powerful of the king's subjects in cases in which the complainant was relatively poor. Many of the petitions to the chancellor during this period show this as the chief ground for appealing to the extraordinary powers of the chancellor as the direct representative of the king. Later the emphasis shifted to the inadequacy of the common law remedies to meet the demands of justice in the particular case. Two features demand notice: first, the normal remedy at common law was damages rather than specific relief, although there were of course exceptions. If, for example, someone were wrongfully threatening to cut down valuable shade trees on another's land, the latter aside from any right to use physical force himself to prevent the trespass had at common law no means of preventing the cutting of the trees; all the common law court would do for him was to give him money damages after the trees had been destroyed. Naturally appeal was made to the chancellor for relief. Second, as the common law developed, the mode of trying cases involving disputed questions of fact came to be by jury. Since the jurors were as a rule uneducated men, it became obvious that certain types of issues of fact were not likely to be handled effectively by a jury. This was, for example, thought to be true in cases in which there was a controversy involving more than two sides or one in which the taking of a complicated account was necessary. Appeals to the chancellor were therefore also made in this type of situation, as there was no jury in the Court of Chancery.

Originally the king and then the chancellor had no rules and principles to guide them in reaching a decision upon petitions for justice; the appeal was to equity in the sense of natural justice; in other words, the justice was executive justice rather than justice according to law. Inevitably, however, as the petitions became more and more numerous, the chancellor began to follow more or less the precedents established by himself in prior cases which seemed to him similar and then later to examine into and follow the decisions of the chancellors who had preceded him. This development of equity from a

system of natural justice into a system of law came to a head while the office was held by Lord Chancellor Hardwicke (1738-56), Lord Thurlow (1778-92) and Lord Eldon (1801-27). The extent to which the early chancellors were influenced by the canon law in working out their doctrines cannot be said to be fully settled. Undoubtedly both canon law and Roman law were of influence. It must not be assumed that this development of a body of law which, while it did not directly repeal the common law, succeeded in getting around its effects went on without challenge from the courts of common law. From time to time protests were made against the growing judicial power of the chancellor, especially when he undertook to interfere with the enforcement of judgments obtained in common law courts, judgments which the latter courts regarded as entirely valid. The controversy came into the open in the reign of Elizabeth, when Lord Ellesmere undertook to enjoin the enforcement of a common law judgment in ejectment. Apparently because of the personal intervention of Elizabeth, Lord Ellesmere was temporarily defeated but succeeded in carrying the day in the reign of James I when all the judges of England summoned by the king to pass upon the question agreed that the chancellor could by injunction restrain the judgment creditor from enforcing a judgment obtained in the King's Bench by a plaintiff who in the opinion of the chancellor had been guilty of fraudulent practises. The exact manner in which the equitable relief was granted in such cases must be carefully noted. The chancellor made no pretense of having any power directly to nullify or set aside the common law judgment or to pass on its validity; he, much like the Roman praetor and the jurists, got around the common law. In English law this was accomplished by alleging that all the chancellor claimed to do was to act *in personam* by ordering the judgment creditor to refrain from obtaining the issue of execution on the judgment, and to threaten him in the name of the king with punishment if he disobeyed. Nominally therefore the common law judgment seemed as valid as ever; actually, of course, it became substantially of no value. Curiously enough this obviously sophistical reasoning that "equity acts only *in personam*," and that therefore the common law rights of the parties are left intact—for if not, equity would be acting *in rem*—has colored the thinking of many, if not most, Anglo-American writers on law ever since the time of Elles-

mere, as the writings of Maitland, Langdell and Ames show. A more realistic view is set forth by some relatively recent writers, such as Judge Charles E. Phelps, Beale, Hohfeld, Billson, Cook and others.

Until the rise of the modern legislative body equity was the great force of legal reform in Anglo-American law. By the development of uses and trusts it profoundly modified the land law of England and America; it developed by means of the law of trusts the first married women's property law; it enabled married women to contract with reference to their separate property in equity; it was the first to enforce simple contracts—this as early as the fifteenth century; in developing the law of specific performance of contracts for the conveyance of law it effected other important changes in the law of real property; it made choses in action assignable before the common law adopted fully the Roman law device of the power of attorney; it developed much of our tort law in connection with the issuance of injunctions in labor disputes and unfair competition; it created substantially the whole of the law of mortgages with its equity of redemption and bills to foreclose that equity; it prevented the enforcement of judgments at law when it seemed inequitable to permit their enforcement; it ordered the reconveyance of land where the conveyance had obtained by fraud or was made by mistake—in fact, it wrote new chapters in practically every field of the law.

As yet adequate studies have not been made of the history of the enforcement of equity in the American colonies prior to the revolution. One of the best statements of what little is known is found in the essay upon courts of chancery in the American colonies by Solon Dyke Wilson. From this sketch it appears that at some period of its history each of the thirteen colonies had a tribunal with chancery powers in some form or other. Upon the separation from the mother country some of the states provided for the establishment of courts of chancery after the model of the High Court of Chancery in England. In others (Connecticut is an example) chancery powers were conferred upon the courts of law, the two systems, however, being kept distinct. In others (notably Massachusetts and Pennsylvania) there were no separate courts of equity or courts to which power to administer equity was expressly given. To some extent the courts of common law in this last group succeeded in adapting common law remedies, so that they gave relief which

under the English system was obtainable only in equity. Ultimately, however, in these as in the other states, jurisdiction to administer equity was expressly conferred upon the courts.

In England the judicature acts of 1873 and 1875 consolidated all the courts into a High Court of Justice. This is divided into five divisions, including one known as the Chancery Division. This, however, is a mere matter of convenient distribution of business, which can be altered by rule of court without statutory change. All divisions are to administer in the cases that come before them all rules of law—common law, equitable, or what not—applicable to the cases before them.

In some parts of America, as in New Jersey and Baltimore, Maryland, there are still separate courts of equity with separate rules of procedure; in others, as in Illinois and the counties of Maryland, one court or set of courts administers both systems of law, but the two kinds of cases are kept distinct and the procedure is different; in still others, as in Connecticut and New York, one set of courts administers both systems and there is, or at least purports to be,

single system of procedure, so-called code procedure, for all the courts. In the federal courts common law and equity are administered by the same court but the two are kept substantially distinct. So-called equitable defenses are, however, allowed by statute in common law cases. In common law cases the procedure prescribed by the state in which the court is sitting is followed; but in equity cases the procedure is prescribed by the Federal Equity Rules adopted by the Supreme Court of the United States in pursuance of a statute of Congress.

It must not be imagined, however, that in the so-called code states the distinction between common law and equity cases has entirely disappeared. The reasons for the preservation of the distinction are numerous. One is, doubtless, the traditional conservatism of the legal profession and its clinging tenaciously to habits of thought and ways of looking at things which are embedded in all the literature of the subject for centuries. For example, the recent "reform" of English property law speaks of certain titles being good "at law" and of others as taking effect "only in equity"—this over half a century after the fusion under the judicature acts. Of perhaps more importance is the fact that in many of the code states the distinction is preserved by legislative or constitutional enactment. To understand this it must be noted that his-

torically common law and equity procedure, *inter alia*, differed in two ways: in the mode of trying issues of fact and in the types of appellate review. At common law the issues of fact were tried by jury; the appellate review was by writ of error, which brought up only questions of law. In equity the issues of fact were tried by the court and, originally, entirely on the basis of written evidence—answers to interrogatories and depositions made under oath—and the chancery appeal was in substance tried *de novo* by the appellate court of the questions of fact as well as of law. The latter difference was due largely to the fact that as the evidence was written the higher court could pass on it as well as the trial court, whereas in the common law case the triers of fact, the jury, had seen the witnesses. While formally the distinction between action at law and suit in equity is abolished by the codes, in essence it is usually restored by provisions, such, for example, as that found in Connecticut, that all issues of fact which prior to the code were triable to a jury shall remain so triable and all issues of fact formerly triable to the court shall remain so triable. In addition, in some states by statute or constitutional provision the distinction as to the kind of appellate review is also retained and chancery suits are reviewed by appeal instead of by writ of error. So long as constitutions and statutory provisions retain jury trial in civil cases as at common law and court trial in chancery or equity cases, and corresponding differences in appellate review, the distinction between law and equity is not abolished. Much can be done and has been done by wise provisions encouraging waiver of jury trials; but not until these constitutional and statutory requirements referred to are done away with and something like the more flexible English system is adopted can a real fusion of law and equity take place. Even then, of course, the distinction between action for damages and specific relief will continue, but there will be no need to call one common law and the other equitable relief.

Although equity has hardened into a system of principles and rules, it must not be imagined that all power for growth has disappeared. To begin with, all systems of legal rules and principles permit of change as novel situations arise and social and economic institutions change. This capacity for growth equity shares with common law. In addition, as the legalization of equity went on, the chancellors to some extent limited the process by the use of vague terms

such as discretion; for example, it was often said that the granting of a particular remedy was "in the discretion" of the court. Vague phrases of this kind coupled with the inherent elasticity of all systems of rules and principles thus permit of a continual growth and adaptation of equity to the changing needs of society.

ERASMUS, DESIDERIUS (1466 or 1467-1536), Dutch humanist. Erasmus was born at Rotterdam from an illegitimate alliance of a priest, and was educated in the schools of the Brethren of the Common Life. At the age of about twenty-two he took the vows as an Augustinian canon; but after some years he left the cloister to enter upon the life of an author, and was one of the first to succeed in earning a living by his literary labors. He was afterwards dispensed from monastic vows. After many rather restless years spent alternately in Paris, England, Italy and at Louvain he finally settled at Basel, where he died. During the latter part of his life the interest of intellectual Europe centered in him in a degree seldom equaled before or after him. His success would have been impossible without the young art of printing, of which he was one of the first to reap the full possibilities.

Erasmus' chief importance lies in the fact that he marks more clearly than anyone else the transition from the Middle Ages to modern times. He despised and denounced all that seemed obsolete, cumbrous, unreasonable or ridiculous in the civilization of his age, pointing with the same deep earnestness to the purity and simplicity of early Christianity and to the clearness and moral freedom of classical antiquity. He was neither a philosophical nor a political thinker, his noble pacifism remains declamatory, while his economic theories do not rise above the naïve. Even a theologian in the strict sense he was not, in spite of his enormous activity in the field of translating, editing and commenting upon the Bible and the fathers. His aversion to absolute dogmatic rigor left him standing halfway between the contending religious parties, but just for that reason his influence continued to affect both. He erected a noble ideal of social and personal purity, sanity and simplicity, resting on a faith in nature and in man and to be aspired at through education, learning and tolerance. Writing exclusively in Latin he was able to reach through his published works and through his innumerable letters the whole of cultivated Europe. If his most permanent influence was to be exercised by two works which he himself regarded lightly, the *Praise of Folly* and the *Colloquies*, it is not only because they

were the most popular but also because after all they contain what was deepest and wisest in Erasmus' mind.

J. HUIZINGA

Works: An edition of Erasmus' works was published by Jean Le Clerc, 10 vols. (Leyden 1703-06). The best English translation of *Moriae encomium* is that by John Wilson, as edited with introduction by Mrs. P. S. Allen (Oxford 1913); for a standard translation of the *Colloquia familiaria* see that by N. Bailey, which has been edited by E. Johnson as *The Colloquies of Desiderius Erasmus concerning Men, Manners and Things*, 3 vols. (London 1900). His letters (until 1528) have been edited, with prefaces, by P. S. and H. M. Allen, 7 vols. (Oxford 1906-28).

ERNEST I, DUKE OF SAXE-GOTHA AND ALTENBURG (Ernest the Pious) (1601-75), German ruler and educational reformer. To repair the ravages of the Thirty Years' War Duke Ernest, acting on the maxim *princeps otiosus, deo exosus*, chose the reform of education as the best means. He was inspired by the principles of religious piety rather than of rationalist enlightenment and was above all interested in improving the condition of the lower classes. In this task he was assisted by Andreas Reyher, whom he appointed as rector of the Gotha *Gymnasium* in 1640. After a general survey of the educational and religious conditions of the duchy, in which Ernest participated personally, Reyher with the collaboration of the duke issued a report in 1642 which in later editions was entitled the *Schulmethodus*. This report served as an educational ordinance for the state and outlined in detail a program of elementary education. School attendance was made compulsory but not free from the age of five; heavy penalties were imposed on negligent parents; the provision of schools and their supervision was regulated; the curriculum was prescribed with a strong emphasis on useful knowledge and nature study in addition to the usual three R's and religious instruction; methods of instruction

emphasized observation and activity by the pupils, following the principles of Ratke, with which Ernest was familiar. A number of model schoolhouses were built and the status of teachers was improved by the establishment of a minimum salary scale and of a fund for the care of their widows and children. Teachers were urged to continue their studies while in service, and the establishment of institutions for their training was contemplated. To promote the efficiency of the system a series of textbooks and readers was prepared by Reyher. In 1656 a plan was proposed for adult education. The work of Ernest the Pious proved of great influence on the subsequent contributions to public education in Germany of August Hermann Francke, whose father was in the service of the duke.

(1810); Böhne, W., *Die pädagogischen Bestrebungen Ernsts des Frommen von Gotha* (Gotha 1888); *Geschichte der Erziehung*, ed. by K. A. Schmid, 5 vols. (Stuttgart 1884-1902) vol. iv, pt. i, p. 1-74.

ERSKINE, BARON, THOMAS ERSKINE (1750-1823), English lawyer. Erskine ranks as the greatest advocate in the history of the English bar. A Whig and sympathetic to democratic aspirations, a man of honesty and courage, he contributed more than any man of his troubled times to the undermining of the law of constructive treason and criminal libel. In company with Burke, Fox and Pitt he served to fix English constitutional liberties in their present forms.

Of noble birth but poor, Erskine's service, first in the royal navy and then the army, was conventional, but he showed independence in preferring a happy marriage with a woman of no fortune. It was Lord Mansfield who influenced Erskine's decision to enter the law. He achieved instant acclaim by his successful defense of Captain Baillie, who, charged with attributing corruption to Lord Sandwich in the latter's conduct of the Greenwich naval hospital, had retained the young advocate because of his early naval experience.

Among the more important of Erskine's forensic battles may be mentioned his defense of Lord George Gordon in 1781 on a charge of treason growing out of the anti-Catholic riots of 1780; his defense in 1783-84 of the dean of St. Asaph, charged with seditious libel, a case that led directly to Fox's Libel Act of 1792, laying down Erskine's principle that it was for the jury, not

the judge, to decide when a publication was libelous; his defense in 1789 of the publisher John Stockdale for publishing a pamphlet against the impeachment of Warren Hastings; and his defense in 1792 of Thomas Paine. The triumph of Erskine's career was perhaps in the series of state trials in 1794 in which he secured acquittal after acquittal.

The last years of Erskine's life were as pathetic and futile as his early years had been brilliant and useful. Curiously, his decline began with his elevation to the chancellorship for the brief period of the ill fated ministry of All the Talents. Unfitted for the intricacies of equity practise, his adoption of the incongruous motto "Trial by Jury" for his heraldic shield caused general ridicule. After leaving the woolsack he spent his time as an idler and man about town. He suffered pecuniary disasters and contracted an unhappy second marriage. His last flare of glory was his speech in the House of Lords in defense of Queen Caroline.

C., *Lives of the Lord Chancellors*, 10 vols. (5th ed. London 1868) vol. viii, p. 222-396, and vol. ix, p. 1-108; Duméril, Henri, *Lord Erskine, étude sur le barreau anglais à la fin du XVIII^e siècle* (Paris 1883).

ERSLEV, KRISTIAN (1852-1930), Danish historian. Erslev's methodical mind, logical thinking and practical talents made him the leader of modern research work and scientific teaching of history in Denmark. He was trained in the school of Waitz, Droysen and Nitzsch, and as professor of history at the University of Copenhagen from 1883 to 1916 he introduced and organized regular courses of historical training according to modern German methods. In 1877 he organized the Selskabet til Udgivelse af Kilder til Dansk Historie (Society for the publication of sources of Danish history) and laid down the plans for the methodical publication of the sources of Danish history. His textbooks on the history of the Middle Ages and of the sixteenth century were models of scholarly presentation of the problems involved, in many cases anticipating later researches; they are still in use in all Scandinavian universities. As administrator from 1909 to 1926 of Denmark's greatest scientific foundation, the Carlsbergfondet, he

was the prime force for the comprehensive consolidation of all kinds of research activity in his country. His own research work was concerned in particular with the history of Denmark from the thirteenth to the sixteenth century, and by his searching analysis of the sources he succeeded in creating a completely new conception of important social and political problems of this period, such as the economic character of the specific Danish feudalism as founded by the Waldemarian dynasty and the influence of the Reformation upon the rise of the royal power. His studies in the history of King Eric led him into the problems evoked by the perpetual conflicts about the Schleswig-Holstein question, and he published a series of researches into the constitutional and dynastic transactions regarding the duchies in the seventeenth and eighteenth centuries, by which he arrived at conclusions contradictory to the official Danish assertions of preceding times. His unprejudiced criticism, free from all narrow nationalism, had a salutary effect upon the general way of thinking in Denmark and helped to prepare the Danish nation for the political self-restraint evinced by the solution of the Schleswig question in 1920.

ERZBERGER, MATTHIAS (1875-1921), German politician. After teaching in an elementary school, editing the Catholic *Deutsches Volksblatt* in Stuttgart and organizing a Catholic news agency and Catholic labor unions Erzberger became at the age of twenty-eight a member of the Reichstag. Despite the opposition of the more conservative Centrist leaders he soon won great influence in the Center party. During the World War he devoted himself to spreading German propaganda in Austria, Spain, Switzerland, Holland, the Balkans and at the Vatican by writings and travel. Although originally unopposed to far reaching war aims, in 1916 he attacked unrestricted submarine warfare and, because of early knowledge of the Czernin

memorandum, called into question Austria's power of resistance. He supported the resolution of July 19, 1917, which while emphasizing "the invincibility of the German people" called for "a peace of understanding and of lasting reconciliation." On the basis of this resolution he succeeded in persuading a majority of the Left to unite with the Centrists in a policy favoring responsible government, democratic electoral reform in Prussia, the transformation of Alsace-Lorraine into a full fledged member of the German federation, the restoration of Belgium and entrance into a league of nations. In the cabinet of Prince Max of Baden, Erzberger held the office of secretary of state. When relying upon Wilson's Fourteen Points the government called for armistice negotiations, Erzberger was appointed chief of the delegation which concluded the Armistice on November 11, 1918. Later in the National Assembly at Weimar he fought for the acceptance of the Versailles Treaty against the vote of the peace delegation.

As minister of finance from 1919 to 1920 he reorganized the German financial system along its present lines. A federal fiscal administration was created and the federal right of taxation broadened. Federal subsidies were given to states and communes; a heavy tax was placed on war profits; an income tax was introduced; indirect taxes were increased; and a non-recurrent levy (*Notopfer*) was laid on capital. The extent and indeterminateness of the reparations claims, however, defeated the plan of removing the danger of the floating debt through non-recurrent taxes. The progressive fall in currency values and the high rates made it extremely difficult to realize the tax program, especially since many large tax obligations were evaded. The nationalists opened a strong campaign of opposition to Erzberger, building on opposition to his tax program, and he was finally murdered by nationalist fanatics.

The fierce antagonism he aroused can be explained by the disappointment of many who relied on his view of the peace and his promises for the future, by the fact that he represented the south German ideal of a greater Germany as opposed to the Bismarckian tradition and by his financial policy, which was tinged with socialist ideas. His great persuasive power was due in part to his manner of presenting the visions of his imagination as though they were objective reality.

Sutton as *The Memoirs of Prince Max of Baden*, 2 vols. (London 1928); Price, M. Philips, *Germany in Transition* (London 1923).

ESCHEAT, in English common law, was the right of a lord to the lands of his tenant who died intestate and without lawful heirs. The failure of heirs might result from the felony of the tenant as well as from the actual absence of kin (except in Kent, where by the custom of gavelkind there was no escheat for felony), but escheat for felony was postponed to the crown's right of wasting the tenement for a year and a day. In Bracton's day escheat might also follow outlawry, and perhaps this is still possible. The right belonged to all lords as well as to the crown and attached to all forms of tenure, its basis being the return of the tenement to the donor or his heirs upon the extinction *de facto* or *de jure* of the donee's line. The right is therefore a part of the continuing lordship over the tenant's lands. The confusing attempts of Glanvill and Bracton to describe escheat as the lord "inheriting" from his tenant soon failed as the maxim became established that one cannot be both lord and heir. Since escheat was an incident of tenure it applied only to land and it must be distinguished from the forfeiture of chattels to the crown for felony and the crown's right to chattels as *bona vacantia*. The only occasion causing forfeiture of lands to the crown was treason. When the estate of a tenant in chief escheated to the crown, his undertenants thereby became tenants in chief and so liable to the more onerous incidents of that position; partial relief in such cases was afforded by Magna Carta, which provided that they were to hold of the crown *ut de escaeta* instead of *ut de corona*. The charter also affirmed the right of mesne lords to take escheats from their tenants convicted of felony—a right which the crown had frequently infringed. All through the Middle Ages escheats were a valuable source of revenue to the crown. Nineteenth century legislation extended escheat to incor-

pooreal hereditaments and equitable estates; but with the restriction of corruption of blood in 1814 to treason, petty treason and murder and its final abolition in 1870 escheat for felony ceased. As a result of the statute *Quia emptores* it has become increasingly difficult to prove the existence of a mesne lordship; and so escheat in modern times has almost always been to the crown, but occasional modern examples of escheat to a mesne lord are to be found. Escheat, however, both to the crown and to mesne lords was abolished in 1925, and instead the crown became entitled to take real property as *bona vacantia* (Administration of Estates Act, 1925, sects. 45 and 46); escheat to the crown as duke of Lancaster and to the prince of Wales as duke of Cornwall is similarly transformed and preserved.

The existence of escheat in America depends on the difficult question whether tenure still exists in certain of the states; this is now merely academic, for legislation and some state constitutions secure the rights of the state to lands as well as chattels, without always making it clear whether the theory is that the state takes them as *bona vacantia* or as paramount lord. At the present day the word escheat is also used for forfeitures, such as where a corporation holds land contrary to the provisions of its charter as well as when an educational corporation is dissolved. Where disabilities are imposed upon aliens, some states exact the escheat of their land if they fail to become citizens within a set period. Escheat is also loosely applied to the state's rights to unclaimed bank balances, savings accounts and so forth. Escheats go to the county where the property lies in Illinois and to the town in Rhode Island; otherwise to the state. Several states devote the proceeds to their school funds.

On the continent the history has been more complicated. Roman law in its early days allowed the first comer to occupy property for which there was no heir and by lapse of time to become the lawful heir of the decedent. Under Augustus the *Lex julia caducaria* attributed *bona vacantia* to the state, and consequently the *usucapio pro herede* was gradually restricted and practically abolished under Hadrian. In early Germanic custom escheats went to the commune as representing the ancient kindred group. With the advent of the feudal age the strictly feudal escheat of benefices was combined with survivals of the notion of the fiscus, and both were regarded, especially in France,

as royal rights similar to *droit d'aubaine*, *droit de bâtardise* and the like. Even feudal escheat was later restricted on these grounds in France to lords having *haute justice*. Elsewhere rights to receive escheats often came by grant or usurpation to local jurisdictions, corporations and the like. The University of Vienna, for example, had the right to receive escheats from its professors and doctors. In some cases the church had claims—hence the maxim *Quod non tollit Christus, tollit fiscus*.

At the present day the right of the state (or sometimes political subdivisions of it) is based upon code or statute: the state usually takes the estate subject to the decedent's debts. A variety of different theories have been propounded as a basis of this right. Some hold that the state is actually an heir—the German civil code lays down this theory—but more often the codes are non-committal. Others see in the right an attribute of sovereignty; a third view regards the state as merely exercising a *usucapio*; still another holds that the decedent's estate discharges his debt toward the great society in case he has no smaller group, as a family, to which he owes duties. The proceeds of escheats generally go into the treasuries of the states concerned but occasionally, as in parts of Germany, they are appropriated to charitable purposes. Although the present tendency to restrict inheritance to close relatives of the decedent would increase the opportunities for escheat, the wide powers of testation have in fact nullified them to a large extent. The present significance of escheat lies in the problem of succession and is connected with the question of inheritance taxation. The theory of the state as heir was recently pushed to its logical extreme in a French proposal (finally defeated) to make the state "a child in every family" so that it would take a share along with the natural heirs.

ESMEIN, ADHÉMAR (1848-1913), French jurist. Esmein was one of the greatest, if not the greatest representative of the history of law in France. Like Savigny or Mommsen he knew how to blend the historical with the juridical spirit in due harmony, but if he had had to show any preference he would no doubt have leaned toward the juridical. Primarily Esmein was a jurist whom a current common to many scholars of his generation in France transported toward the past. Hence his method differed considerably from that of the ordinary historian: it was above all reconstructive.

Esmein, the historian of an institution, was prompted to start from the perfected institution and to follow the current of time back in order to determine the origin of its characteristic features. That constrained him to make a choice, to neglect whatever is not juridically important—a method involving a certain danger, that of lapsing into the arbitrary and the subjective, and hence capable of being used only by a mind such as Esmein's, at once very free and very judicious. As in the case of Taine, whose lectures he had attended and who was not without influence upon his mind, superficial critics ventured to reproach him with being "systematic." Esmein, however, did no violence to the facts in grouping them around a small number of clear ideas which themselves sprang from facts.

This method, which is indeed that of the history of law and which Esmein, a truly encyclopaedic mind, was the first in France to handle with such mastery, he applied to the whole domain of the law. In Roman law he left an open trail in his *Mélanges d'histoire, de droit, et de critique, droit romain* (Paris 1886); its articles on the law of the family and of property are especially noteworthy. His three manuals, the fruit of his lectures in the Paris faculty, embrace the history of French law considered especially from the standpoint of public law: *Cours élémentaire d'histoire du droit français* (Paris 1892; 15th ed. by R. Génestal, Paris 1925), *Précis élémentaire d'histoire du droit français de 1789 à 1814* (Paris 1908) and *Éléments de droit constitutionnel français et comparé* (Paris 1896; 7th ed. by

H. Nézard, Paris 1921). In the history of private law he wrote among other things *Le mariage en droit canonique* (2 vols., Paris 1891; 2nd ed. by R. Génestal, vol. i—, Paris 1929—) and a valuable *Étude sur les contrats dans le très ancien droit français* (Paris 1883). Finally, in the history of criminal law he left an important *Histoire de la procédure criminelle en France* (Paris 1882; tr. by John Simpson as *A History of Continental Criminal Procedure*, Continental Legal History series, vol. v, Boston 1913).

ESPINAS, ALFRED (1844-1922), French sociologist. Espinas studied at the École Normale Supérieure in Paris and became an associate in philosophy in 1871. From 1880 to 1894 he taught with distinction at the University of Bordeaux, where Émile Durkheim was one of his colleagues. Later he was called to the Sorbonne and in 1905 was elected to succeed Gabriel Tarde at the Institut de France.

Espinas' abilities as a scientific observer and theoretician had become evident upon the appearance of his doctoral thesis and most notable work, *Des sociétés animales* (Paris 1877, 2nd ed. 1878). It reflects the intellectual temper of the period following the defeat of 1871: fear of social utopias; distrust of individualism and of socialism as well, because the latter seeks to establish individual equality; a search for "scientific" laws governing societies. This study of the symbioses, domestic societies and colonies of animals was intended to show that society is not a bundle of abstract relations or a structure of contractual arrangements but an organized body, a living entity subject to such natural laws as those of cooperation, division of labor, delegation of functions and the like. Later in an important article, "Être ou ne pas être, ou du postulat de la sociologie" (in *Revue philosophique*, vol. li, 1901, p. 449-80), Espinas maintained that his peculiar synthesis of organicism and evolutionism offers the only possible basis for a true science of society. At the same time he pointed out that the family is the link between nature and society. Although far removed from the individualistic *interpsychologie* of Tarde, he did recognize the psychic element in all social

bonds. Nor did he overlook factors peculiar to human societies; in fact, he was one of the first to insist on the cultural importance of tools as the embodiments of human volitions and he described the influence of technology on all cultural spheres, including philosophic thought.

ESPIONAGE is the practise of obtaining information about an actual or potential enemy clandestinely for possible use against that enemy. It was used in the earliest tribal aggressions as a form of advance scouting of a more venturesome and hazardous sort. Espionage played an important part in military strategy and organization in ancient conflict, especially in Asia. In western Europe the age of chivalry brought espionage into temporary disrepute. For the first time in history spies were condemned to death because of their spying rather than because they were suspected enemies capable of bearing arms. The mediaeval church relied upon spies and operated a very efficient secret service for five centuries. According to some authorities the confessional was originally but a part of the vast and subtly coordinated system for gathering intelligence. The spy system of the Mongols during the twelfth and thirteenth centuries excelled all other systems of military espionage before 1870. Accurate information, covering topography, defenses of cities and fortified places, size and equipment of armies and even the morale of civil populations, was gathered weeks and months in advance of attack. Mogul emperors of India, such as Akbar, employed as many as four thousand spies who, disguised as scavengers, entered every house twice a day. The secret police of imperial Rome, the *Okh-rana* of the czars and other bureaus of political police in modern Europe seem ineffectual in comparison with Akbar's espionage system.

The terms secret service and espionage system loosely describe the groups and cohorts of spies operating for kings and conquerors in ancient or mediaeval times, but the systematic organization of spies or military secret agents

is of comparatively recent origin. Frederick the Great has been credited with the innovation of organized espionage, but Maurice de Saxe, in his posthumously published *Réveries ou mémoires sur l'art de la guerre* (The Hague 1756; tr. by William Fawcett, London 1757), shows the same original conception of espionage as an integral part of military science which was afterward to distinguish the plans and campaigns of Frederick. Wilhelm Stieber, who served for two decades as Bismarck's chief of espionage and police minister, claimed to have more than thirty thousand spies in the invasion zones of France on August 6, 1870, the day of MacMahon's defeat at Worth. Upon Stieber's death in 1882 the practise of spying began to experience an obviously faulty elaboration at the hands of his European imitators and became bewilderingly intricate. When the World War came in 1914 this complicated mechanism was quickly exposed as a clumsy burden, and both sides soon found the Stieber method out of date. Counterespionage, which is the defensive operation of spying upon spies, emerged with a well developed police technique that blocked and baffled the offensive. As a result months before the end of the war in 1918 neither the agents of the Allies nor of the Germans and Austrians were doing any significant amount of spying.

Spies became counterspies after the peace treaties had been signed and the place of espionage in international relations became very delicately defined. All governments repudiate the individual spy if he is detected but insist on the necessity for espionage; they fear spies and fear even more not to keep some of them constantly employed. No government desires to indicate aggressive inclinations and so it is found much more convenient to discover that large appropriations must still be voted privately and disbursed secretly in order to make certain that neighboring states are not turning bellicose. This urbane defensive may continue indefinitely, with the spy eclipsed by or merging with the military policeman.

The spy in time of war endeavors to win the confidence of the enemy, for he wishes to report not only what he sees but what he has been told in confidence. He seeks information concerning the distribution of troops, new weapons under secret construction, sources of munitions and other supplies, the state of army and civilian morale, losses sustained in recent engagements, naval concentrations and the gen-

eral political situation. New fortifications, weapons or poison gases invite espionage in time of peace; and the diplomatic or consular officials, who have been called accredited spies, are expected to gain information concerning any such new defense or military or naval threat without embarrassing their superiors or home governments. When hostilities break out the diplomats are compelled to operate clandestinely from neutral countries, and the eventual embarrassment of such an undertaking usually transfers espionage duties to special secret service agents, who attempt to direct a network of spies more or less strategically located. A few daring and exceptionally gifted army or navy officers may themselves serve as spies. Such highly prized agents are usually collectors of the information that resident spies are gathering. Amateur spies are often effective, especially if recruited in regions oppressed by an invader, as is illustrated by the work of Belle Boyd in the American Civil War for the Confederacy and of Alice Dubois (Louise de Bettignies), who organized and directed a private and wholly amateur secret service in Belgium and the occupied departments of France during the early months of the World War. Professional civilian spies are generally adventurers of a disreputable sort, and while a few of them active in the World War were found to be able, devoted and loyal, the great majority proved incompetent to a degree that would have been ludicrous if it had not cost many of them their lives. Wholesale professional informing agencies offering for sale to government representatives plans of fortifications, naval bases or mobilization arrangements have been known to flourish briefly. Espionage specialists try to be exacting on the score of reliability. Even an ardent patriot may blunder or be deceived and therefore all reports from spies are checked and rechecked against one another and by the staff in a variety of ways. Doubtless bureaucratic skepticism during the war cost more than one reliable agent a phenomenal success. But if everything reported by spies, informers and hysterical civilians had been recklessly acted upon, massacre and chaos would have resulted.

Actual combatants seem little disturbed by spy scares except in the midst of retreat following a military disaster. But the civilian mania for denouncing suspected spies is dreaded by all espionage and counterespionage branches. The professional spy takes advantage of public hysteria at the outbreak of hostilities, craftily

locating himself while the mad harrying of innocent persons distracts the counterspies who might be seeking him. Several officials were mistaken for spies and shot and killed by zealous non-combatants in Germany during August, 1914.

Every European belligerent was believed to have entered the war with a highly trained espionage system already in good working order, yet not a single major action was strategically influenced by any one of the combatant spy services. Germany in particular, because of Stieber's former excellences, was thought to be ready for a second exhibition of sly mastery and thorough preparation, but many instances of German secret service defeat, neglect or failure might be cited. British counterespionage officers arrested a barber named Ernst who had been the go-between of German agents in Great Britain the very day war was declared, thereby blinding the German staff so far as England was concerned. Similarly at the beginning of the Verdun offensive German counterspying forces wiped out an overextended chain of French spies after detecting a single agent attached to it.

Patriotism or the desire for more rapid promotion is the incentive for many spies having a regular military position. Those who accept dangerous assignments for other than patriotic reasons are prompted usually by love of adventure or by avarice or perhaps by dire need induced by wartime economic changes. The remuneration of spies in all but exceptional instances is in no way adequate to the risks they incur.

Within a limited range women and children are effective espionage agents, but the much dramatized sex element in espionage has been exaggerated. Elderly generals and others possessing secrets worth gaining may be susceptible enough, but almost without exception the women sent against them have proved hopelessly unreliable. A number of women spies in the World War changed sides, sold out to the enemy, turned double spy, professing to serve both sides, or abandoned the enterprise for a trivial reason.

Spies obtain information easily; difficulty and grave danger set in when they attempt to communicate what they have learned. The technique of counterespionage is a police technique borrowed from secret service in other fields, from political espionage and crime investigation. Censorship scrutinizes the post and tele-

graph, seaports are guarded and false passports, necessary to the mobile spy, are watched for. Camps, cantonments and munitions plants are guarded and control areas are established at base ports, along vital communication lines and within a certain distance of the battle line. Counterspying in time of peace may be largely a fortuitous matter, but in time of war the counterspies manage a hundred forms of vigilance and surveillance.

Penalties for spying are relatively mild in peace time except in those countries of central Europe where international tension never abates. In war the spy may suffer the death penalty or a long term of harsh imprisonment, the latter often being commuted when peace returns. Spies are executed not because espionage is an outlaw undertaking but in order to discourage spying on the part of able officers or operatives whose lives the enemy government will be reluctant to imperil. Spies when captured are subject to an abrupt court martial, yet in both England and the United States many espionage cases were prosecuted in the civil courts. With a single exception there were no executions in the United States.

Most regulations to destroy espionage work hardship on persons having no connection with military secret service. In all countries during the World War the internment of enemy aliens, a measure intended to bag potential spies, did the greatest amount of harm to frail, elderly or invalid non-combatants and restricted few if any spies. The espionage antidotes and laws restricting aliens have been a club in the hands of irresponsible officials everywhere. Alarmed and excited patriotic groups joined political police bureaus in the oppression of radicals and other minorities, using wartime legislation long after the war and subsequent demobilization had terminated. In all European countries counterespionage has pursued suspected spies in the same intense manner as during the World War. Minorities stranded by the Versailles and other treaties, such as the Jugoslavs left subject to Italy, have been consistently oppressed by secret police agencies (see POLITICAL POLICE) using the convenient pretext of espionage. Radical organizations in the United States, as elsewhere, have been dealt with much more thoroughly than were any agents of imperial Germany during the war. It is worthy of notice that the Espionage Act of 1917 is still in force in the United States.

Espionage, which has the ironic effect of

linking governments to the methods and practices of the criminal underworld, is not exclusively a government enterprise. Industrial espionage and commercial espionage also exist. Employers who use industrial espionage hire private detective agencies, which place spies in industrial plants to keep watch upon the men, penetrate unions to disrupt them and prevent unionization of shops, to get evidence leading to the discharge of agitators and malcontents and to break strikes. Commercial espionage, a manifestation of unfair competition, is used by business concerns in order to obtain the patents and markets of competitors. It is not new but was practised centuries ago when rival guilds sought to carry off each other's secret processes. Diplomatic and consular officials often engage in commercial as well as military espionage in times of peace. War offers vast opportunities for commercial espionage. With the assistance of the alien property custodian of the United States during the World War the patents of German subjects were impounded, secret chemical formulae revealed and customers' lists freely examined. The British have claimed that their spies had obtained all the formulae of German dyes by 1915, even before the new poison gases for cloud attacks and shells were being reported by other espionage agents assigned to the protection of the military forces.

ESQUIROL, JEAN-ÉTIENNE DOMINIQUE (1772-1840), French psychiatrist and public health administrator. After studying medicine at Toulouse Esquirol became a public health officer in the army, serving at Narbonne. He finished his studies at Montpellier, the chief intellectual center of the south, and in the year VII of the republic went to Paris in search of a

livelihood. His meeting with Pinel at the Salpêtrière determined his career. He became an assistant at the hospital, publishing as his inaugural thesis *Des passions considérées comme causes, symptômes et moyens curatifs de l'aliénation mentale* (Paris 1805). In 1811 he became first assistant to Pinel and finally was entrusted with complete control of the entire institution—the large public almshouse hospital with its psychopathic wards. Here, like Pinel, he did formative work toward establishing more humane and systematic methods of treating psychopathic patients. After inaugurating the first public teaching clinics on mental disorders in 1817 he left the Salpêtrière in 1826 to become chief physician at the royal sanitarium at Charenton, then the outstanding semipublic mental institution in France. He was an active organizer and administrator; largely through his efforts Pinel's reforms were introduced into the provinces. He took great interest in formulating legal measures for the care of the mentally abnormal, notably the first uniform legislation of 1838.

Esquirol's ideas concerning mental disorders followed closely those of his master, Pinel, but displayed a more direct psychological interest. The emotions were for him the most important of the active causes of the psychoses. Fear, worry, unhappy family life, religious controversy, conflict with the folkways, reversal of fortune—all these were of primary significance. Heredity played a predisposing role. At a time when psychiatry was just recovering from an orgy of classification and when crude analysis presented hundreds of forms of mental disease, Esquirol's classification was on the side of simplicity. All of the psychoses were grouped by him into five classes—lypomania (melancholia with delusions), mania, monomania, dementia, idiocy. His chief contribution here was the analysis of monomania, now abandoned in psychiatry but still retained in law, as delusional thinking centering about a supposedly single idea or isolated group of ideas. His studies on hallucinations, which he distinguished clearly from illusions, are still classic.

ESTATES GENERAL. The French representative bodies which came to be known as *états généraux* trace back through various intermediate stages to the plenary assemblies of early Capetian days. In times of emergency the king, prompted either by a genuine desire for advice or, as was more common, by the hope of ingratiating himself with his subjects by pretending to take them into his counsels, summoned as he saw fit representatives to deliberate with him on problems of state. At first such invitations were limited in the main to the nobility and the clergy; but beginning with the twelfth century and to a much greater degree in the thirteenth this royal favor was extended to the other classes as well, which at about the same period in England and in Spain were beginning to make their influence felt in parliamentary deliberations.

The size and general procedure of the early French assemblies long remained unfixed, varying according to the wishes of the king. The three orders, or, as they were soon called, estates, tended, however, to become separate entities, each of which might be summoned independently of the others. When the emergency was primarily financial, as was the case several times under Louis IX, the invitation might be issued to the third estate alone. But when broader national or church issues were involved, as during the periods immediately preceding the crusade of Egypt in 1248 and that of Aragon in 1284, the king, as an overture to public opinion, usually summoned the three estates together.

Under Philip IV the assembly, which hitherto had been merely a device for consultation in abnormal circumstances, began to acquire the status of a formal institution. During his protracted struggle with Pope Boniface VIII the king was unusually solicitous of the opinions of his subjects. On a number of occasions, beginning with the impressive assembly at Notre Dame in 1302 and recurring at unprecedentedly short intervals, Philip had recourse to consultations with the representatives of the three orders "upon certain affairs of the highest concern to king and realm." As a general rule, of course, whatever the type of problem, the role of the assemblies consisted almost entirely in sanctioning some royal act already executed. But even this ex post facto concurrence, however much of a formality and however restricted, was tending to become incorporated in the traditions of royal administrations.

Within a few years an even more important transformation began to take place in the character of the assembly. Hitherto the personnel had been determined from above—by the king or usually by one of the royal officials in the bailliages, or *sénéchaussées*, which constituted the administrative units of mediaeval France. In 1317, however, Philip v by an edict authorizing the principal cities throughout the kingdom to select their own representatives to the forthcoming assembly introduced the elective principle, which was to become more and more the accepted method of determining the membership of the Estates General. This new element—the concept, however embryonic, of a representative system founded upon actual constituents—seems to have resulted very shortly in a change of attitude on the part of the king as well as of the representatives themselves. The latter seemed disposed, and sometimes were even prompted in that direction by the king, to assume the new and startlingly aggressive role of making articulate the wishes of the nation. The king, with an eye on the depleted treasury, listened patiently and was at times even moved to accede to these wishes.

This tendency toward active participation in government was greatly accelerated by the rapid decline in prestige of the French monarchy during the Hundred Years' War. From 1356 to 1360 King John was a prisoner, while the political and military situation was becoming increasingly grave. Under the resolute leadership of Étienne Marcel the Estates General acquired for a brief interlude prerogatives which entirely transformed its character. Taxes were to be levied only with the consent of the representatives of the people; disbursements were subject to their supervision; assemblies were to be held annually; a thoroughgoing reform of the monarchy was demanded. The Estates General of 1358, attended by only the clergy and the third estate, was outspoken in its revolutionary threats, but with the death of Marcel the movement quickly collapsed.

The firm hand of Charles v while tending to reduce the assembly to its more normal role was unsuccessful in exterminating the spirit which had been aroused and which was to persist well into the next century. Throughout this period the estates were frequently although irregularly summoned to vote emergency subsidies. Although the sovereign power continued to reside with the king, the representative body never ceased even during extended periods of

inactivity to serve as a potential threat, always on the alert to detect a weakening of the central authority, whether due to political or financial factors. On occasion, as in 1413, the members of the Estates General, indulging in unsparing criticism of governmental policy, were strong enough, thanks to the king's need of money, to secure temporarily at least removal of the higher administrative officers of the crown as well as the enactment of an ordinance (*Ordonnance cabochienne*) prescribing reforms.

But whatever potential legislative ability the members of the various Estates General may have harbored was more than counteracted by their ineptitude for cooperation in a sustained course of action. Even the enterprising third estate tended to dissipate its energies in querulous intransigency and volatile formulation of grievances. More and more inclined to chafe at the personal inconveniences involved in attending a protracted central assembly, the estates were by no means ill disposed toward the device of one Estates General for the northern and another for the southern section of France and observed with similar equanimity the inauguration of a practise whereby the representatives of each province met separately in an "estate provincial."

The strong centralized authoritarianism of Charles vii and of Louis xi, who seems to have convened an Estates General only once, greatly curtailed the activities of the representative institution. During the minority of Charles viii the none too secure regents resorted to the now time honored device for conciliating public opinion. But the nearly three hundred representatives who in 1484 assembled in Tours and engaged in two months' vain discussion as to the reform of the realm provided but a brief interlude of activity. For eight years later Charles assumed active direction of affairs and thereafter neither he nor his successor, Louis xii, was dependent for his authority or his finances upon a representative assembly, and the very widely separated convocations were but formalities. As a substitute for the Estates General, of which he was suspicious, Francis i relied upon assemblies of notables composed of the most tractable representatives of the nobility, the clergy and the courts, supplemented by a very carefully chosen group of similarly disposed commoners from the *bonnes villes*.

But during the critical years of the religious wars the rulers, under pressure of financial distress and widespread religious schism, were

again forced to resort to the older device. In spite of interminable discussions little was accomplished. The natural antagonism of interests between an impoverished ruler and an impoverished assembly was heightened by bitter religious animosity. In 1589 the presumptuous insistence of the deputies that all decisions concurred in by the three estates should have the force of law discouraged further deliberation. The Estates General of 1593, at which a mere handful of deputies engaged in futile discussion concerning the best means of effecting a religious peace, was generally regarded as symptomatic of an obsolescent institution, while the discordant bickerings between the three estates in the confusion following the assassination of Henry IV was almost universally conceded as final proof of their impotence.

Yet the tradition persisted that the Estates General might in times of crisis still be summoned as a last resort. During the minority of Louis XIV when the country was disturbed by the activities of the *Fronde* a move was launched in 1649 to summon the three orders to an assembly at Rouen. This was unsuccessful, however, and during the long period of absolutism which was inaugurated shortly afterward there was no disposition on the part of the king to revive an apparently obsolete institution. But with the death of Louis XIV the idea of using these representative assemblies to counteract royal despotism was resurrected. In the confused period of the regency this revived interest centered in the Club de l'Entresol; the count of Boulainvilliers addressed a memorial to the regent urging the immediate convocation of an assembly and wrote his famous *Lettres historiques sur les parlements ou états généraux*. Although the actual execution of these proposals was forestalled by the attitude of the tribunals known as *parlements*—which vaunted themselves as the true representatives of the nation since the function of the Estates General was limited to "very humble supplication"—political theorists continued to point out the usefulness of the Estates General as a device for guarding against arbitrary taxation.

The coup d'état of Maupeou in 1771 suddenly removed these discussions from the realm of theory. The historically grounded defense of the Estates General by Marie de Lézardière, the abbé Mably and many others focused attention on a revival of the institution, and the government of Louis XVI came soon to regard such a course as inevitable. In 1786, when the

financial situation had become desperate, the minister of finance, Calonne, attempted to continue in power by recourse to an assembly of notables. But the notables themselves took the position that under the circumstances they were no adequate substitute for the larger body; and the courts of justice, taking the same attitude, proclaimed that further taxation was impossible without the concurrence of the representatives of the people. Public opinion was becoming increasingly articulate and insistent in its demands for a convocation of the Estates General, and finally on July 5, 1788, an order from the royal council officially acceded to its request. To the popular agitation for a representative body had been joined a demand for an apportionment of representation which would double the personnel of the third estate, making it equal in numbers to the clergy and nobility combined. Although such a distribution was vigorously opposed by the two less democratic orders and by the *parlements*, the intensity of public opinion, which was gradually becoming organized, was powerful enough to force the innovation upon the government.

In the elections held according to baillages, the deputies of the clergy and the nobility were chosen by direct, universal suffrage and those of the third estate with only very minor suffrage restrictions. Preliminary local assemblies of each of the three orders were held in order to prepare *cahiers de doléances*, in which were summarized the grievances and demands of the electors in the bailliage. Although the significance of these *cahiers* is vitiated somewhat by the fact that the government had prepared stereotyped models to be circulated among the third estate assemblies in the towns and especially in the local rural units—which, owing to the original manipulation by the government of the franchise requirements were to send a disproportionate number of deputies to the central assembly—they constitute, taken as a whole, a fairly accurate reflection of popular opinion throughout France. The elections were held without governmental interference, and the twelve hundred elected deputies arriving in Versailles, each with his *cahier*, were to an unprecedented degree national representatives, qualified and determined to consider questions of national welfare. On the initial question of procedure the deputies of the third estate, who soon proved themselves the dynamic force in the assembly, vigorously opposed the assumption of clergy and nobility that the three orders

were to deliberate in separate sessions. On June 10 under the leadership of Sieyès—a deputy already known by virtue of his provocative brochure, *Qu'est-ce que le tiers état?*—the third estate formally invited the other two orders to participate in a joint session and resolved that in case of refusal the deliberations of the single body should be considered as binding. A week later, supplemented by a few deputies of the clergy, the third estate proclaimed itself the “national assembly” and in the face of continued official interference dramatically pledged itself “never to disband . . . until the constitution of the kingdom has been firmly established on a solid foundation.” When on June 23 a royal declaration nullified this decision and decreed separate sessions of the orders, the deputies of the third estate, supported by 150 of the more democratic bishops and curates who had joined them the previous day, openly defied the representative of the king and voted itself a sovereign assembly, which could be disbanded only on its own initiative. The defiance was effective. On the following day practically the entire remainder of the clergy met with the third estate, and the next day many of the nobles capitulated. Two days later on the twenty-seventh the king countermanded his earlier decree and recommended that the three orders deliberate as a single body. The National Assembly had become a reality.

ESTOURNELLES DE CONSTANT, BARON D', PAUL HENRI BENJAMIN (1852–1924), French politician and diplomatist. He was for a while in the colonial service in Algiers, where he put forward proposals for softening the tech-

nique of colonial administration in order to perpetuate European conquest of backward peoples. After serving in diplomatic posts and rising to be minister in London he entered politics, was elected deputy for the Sarthe in 1895 and served as senator for several terms.

D'Estournelles de Constant attempted to devise institutions to help maintain international peace. He objected to being called a pacifist, reserving the right to fight when he considered fighting necessary or justified. He took no part in the work of the pre-war peace societies and attached little importance to the routine of peace congresses. He favored exceptional manifestations as more likely to produce a decisive influence at a given critical moment. His successful visit to the United States in 1902 to induce President Roosevelt to bring a dispute with Mexico before the arbitral court at The Hague (until that time unused) was such a manifestation. He was a delegate to the peace conferences at The Hague in 1899 and 1907 and was awarded the Nobel Peace Prize in 1909. Between 1904 and 1909 he organized a series of interparliamentary visits among the parliaments of Great Britain, France, the Scandinavian countries and Russia. He introduced into Europe from the United States the organization known as International Conciliation. In 1911 he was made the first director of the European Center of the Carnegie Endowment for International Peace. At the outbreak of the war he entered actively into patriotic work. Despite minor variations from the usual his attitude and activities may in general be characterized as typically those of a liberal reformer in international affairs.

ETHICAL CULTURE MOVEMENT. The term ethical movement is now generally restricted to those organizations which aim to promote appreciation and understanding of the sense of duty, of moral law and of infinite human worth. Positivism, utilitarianism and idealism were ethical movements in a sense and during the latter part of the nineteenth century a distinguished group of philosophers in England formed the London and Cambridge ethical societies, which conducted scholarly lectures and promoted philanthropic reforms. The earliest as well as the most significant, however

of all such movements originated in the Society for Ethical Culture which was founded in New York in 1876 by Felix Adler. This society was composed of both Jews and Gentiles who wished to consecrate themselves and their children to a religious moral life, both in theory and in practise, independent of all creedal and theological dogmatism.

Felix Adler was the son of a rabbi and was reared in Reform Judaism. His studies in Kantian philosophy and historical criticism which led him to abandon the limitations of Jewish theology served, however, to reenforce his religious faith in moral law. To this faith he added a keen interest in social reform motivated by his concern for individuality and the intrinsic holiness of man. He was also influenced by his studies in Christian ethics and by the writings of Emerson.

The intellectual life of the movement has been deeply influenced by the ethical philosophy of Adler, but no single philosophy, creed or doctrine is prescribed. Members may or may not have other religious beliefs and affiliations. The underlying idea of the movement is that morality can and should be maintained and cultivated in its own terms, free from external sanctions or incidental motives. Therefore the aim of ethical culture is "to assert the supreme importance of the ethical factor in all the relations of life—personal, social, national, and international, apart from any theological or metaphysical considerations" (Society for Ethical Culture of New York, *Directory*, New York 1920, p. 18).

The unifying force in the movement is the consecration and participation of the members in practical endeavors to solve such moral problems as are involved in family and sex relations, in the relations between vocations and classes, in the elevation of labor and alleviation of poverty, in "the moral poverty of the . . . well-to-do classes" and above all in education. These problems are discussed from the ethical point of view, but the emphasis is placed less on the theoretical discussions than on the application of ethical ideals to specific needs. Although the adherent of ethical culture realizes that moral reform implies economic and political reform, his chief concern is with the moral aspect, the aim being to clarify and apply those ethical principles which may serve to guide the necessary material reorganization of society.

The societies also carry on distinctively religious activities. They hold Sunday services at which addresses are delivered, and the leaders

officiate at marriages and funerals. On the whole, the societies have developed few ceremonial forms, although in England Stanton Coit has adapted older liturgical materials to the services in his Ethical Church.

Chief among the philanthropic activities of the ethical culture movement are its educational institutions. It took an early lead in promoting free kindergartens, child study associations and adult education. Its efforts to enhance the meaning of vocations by emphasizing the moral ideas and issues embodied in them have been fruitful both as educational programs and as principles for group organization. The Ethical Culture School in New York City, which includes a high school and a kindergarten, is one of the most distinguished and educationally successful schools in the country.

The ethical culture societies have initiated or actively promoted such movements as tenement house reform, abolition of child labor, visiting nurse associations, settlement houses (for example, the Hudson Guild and Madison House in New York) and legal aid bureaus. In Germany they have promoted public libraries, recreation facilities and numerous charitable enterprises. The founding of the Secular Education League in England in 1907, the Universal Race Congress in 1911 and the International Congresses on Moral Education also deserve mention. The movement originally sponsored the publication of the *Ethical Record* (1888–90), which was succeeded by the *International Journal of Ethics* (1890).

Affiliated societies have been organized by such leaders as William M. Salter in Chicago in 1883, by S. Burns Weston in Philadelphia in 1885, by Walter L. Sheldon in St. Louis in 1886 and by Leslie W. Sprague in Brooklyn in 1906. In England, beginning in 1886, societies were organized by Stanton Coit, Percival Chubb, Horace J. Bridges, George E. O'Dell, Harry Snell and others. The movement spread to Germany chiefly through the influence of the sociologist Georg von Gizycki and later to Austria, Switzerland, France, Italy and even Japan. Among the other influential leaders might be added the names of John L. Elliott, Henry J. Golding, Alfred W. Martin, David S. Muzzey, Henry Neumann and in Europe Wilhelm Boerner and Rudolph Penzig. In 1887 the American societies were federated into the American Ethical Union, and in 1896 an International Union of Ethical Societies was organized. The chief strength and organic unity of the

movement is still to be found in the American societies. In 1930 the six American societies had 3500 members, about half of whom were in New York and Brooklyn.

Consult: Adler, Felix, *Creed and Deed* (New York 1877), *The Religion of Duty* (New York 1905), and *An Ethical Philosophy of Life* (New York 1918); *Aspects of Ethical Religion*, ed. by H. J. Bridges (New York 1926); *The Fiftieth Anniversary of the Ethical Movement, 1876-1926* (New York 1926); Neumann, Henry, *Education for Moral Growth* (New York 1923); Salter, W. M., *Ethical Religion* (2nd ed. Boston 1890); Sheldon, W. L., *An Ethical Movement* (New York 1896).

ETHICS. Although morality and ethics are both related to custom, there is a fairly well observed division of significance between them. Conduct social in fact may be described as moral when it is maintained or even observed as a fact. But as conduct rises from fact to ideal it becomes ethical. In a word, ethics is the organization or criticism of conduct in terms of notions like good, right or welfare. The ethical differentia is the construction or reconstruction of conduct in the light of those rational elements which pass for ideals.

Ethics must be distinguished, on the other side, from theology. Once the element of the ideal is invoked, conduct may lose its tang and concreteness by being seen too much under the aspect of eternity. Conduct affiliated too intimately with ideals grows mystical and loses its social significance. That is, conduct may cease to be ethical from overidealization as well as from underidealization. Indeed, ethics may best be distinguished from theology by regarding its commerce with ideals as a piecemeal give and take rather than as initial surrender and subsequent devotion. Ethics is the secular and critical manner of taking account of the rationalizing process in conduct. Its temper is non-mystical, and its orientation is social rather than theological. Not that religious influence has not tried to furnish a theological foundation for ethics or, more frequently still, tried to provide sanctions to budge conduct toward moral perfection. Rather, in spite of efforts and claims, the history of this relation since Socrates has been the story of the gradual moralization not only of religious machinery but of the gods themselves. Ingersoll's waggish remark, "An honest god is the noblest work of man," has now been documented into seriousness.

Throughout western speculation ethics has

bulked large in the philosophical enterprise as a whole. Since Socrates indicated mankind as the proper concern of "lovers of wisdom," speculation as a guide to conduct has been prominent. While Socrates was unproudly aware of the centrality for philosophy of the ethical impulse, the growing prestige of disinterested thought has not infrequently obscured from his successors the role played in their thinking by ethical motives. Important as ethics has been in the systems of most great philosophers, it is fair to say that it is critical retrospect that has usually enlarged the ethical segment of such systems. While Plato consciously took the good as the kingly center of his system of ideas he seems not to have conceived it (although his critics have been continually quick to do so) as a rationalized projection of what he found satisfactory and could recommend in the social life of Athens, when that life was perfected by excellencies borrowed from Sparta. Even the Platonic metaphysic is moral: the idea of the good is the source not only, as the *Republic* has it, of light but of being also. Aristotle thought to reunite the ideal and the real into a functional unity. But since by nature man is a social animal this unification never strays far from moral paths. Since, however, morality as the factually social is blind, ethics is centrally established in the form of the taste of enlightened and cultured persons. The good is the goal, and it is what cultural connoisseurs declare it to be. If in the metaphysical end God gets more detached from the stirring life of men than was Plato's form of the good, God still preoccupies Himself with what from an inside view is ethical: namely, with His own, let it be hoped also man's, good. Indeed, the very metaphysical detachment of God seems to spring from the fact that nothing save His own intellectual activity is worthy of divine preoccupation.

The historical eventuation of classical Greek philosophy into the frankly practical *Weltanschauung* of stoicism and Epicureanism is itself an oblique acknowledgment of the inner dominance of the ethical aspect. As long as the social texture of the Grecian world held together, the principles of conduct were sufficiently habitual to be intellectualized as aesthetic independents without disturbing the moral course of life. When morality is only habit, ethics easily grows aesthetic. But once the stream of conduct itself was disturbed and men were loosed from ancient familial, political and vocational moorings

by the shifting of trade or the movement of armies, the ideal element had to be consciously related again to conduct to prevent such unmoored elements from drifting. Epicureanism and stoicism provided a way of life for those who but for them would have had no cues for conduct other than merely the hated cues of alien constraint.

When this vast unsettlement in the Mediterranean basin reached peoples seasoned by long adversity into chronic habits of unrestrained idealism, Christianity was born. The Christian doctrine differed from Greek philosophy chiefly in its unshakable affirmation that goodness and power are united into one—a beatific unification of which the poor were to be the chief beneficiaries. Such a faith represents the final limit of the idealizing process. It is easy, indeed inevitable, for the human animal to confront the “worse-in-fact” with the “better-in-prospect,” and as long as there is a discernible continuity of means between the two we have normally the ethical field—conduct related to if not determined by ideals. But when the worse becomes the worst and the better the best, when the gap between the ideal and the real yawns into a gulf so impassable that natural means must be supplanted by divine cataclysm, then supernatural religion displaces ethics as a guide to life. But supernatural Christianity may best be conceived as merely the unrestraint of a process which under control we have described as the ethical impulse. What was added to Greek idealism to make Christianity possible was a certain personal warmth and goodness guaranteed rather than ignored by power: the ethical differentia enshrined supernaturally and got at mystically. Christian philosophy has ever sought progressively more rational methods of making available and effective the assertion of such an ethical faith.

Save for idealism, the one system that has proudly carried on the classical tradition, modern philosophy beginning with Descartes has not been paramently ethical. The idealistic tradition has claimed more than its share of great names in modern times—Leibnitz, Kant, Fichte, Hegel, Green, Bosanquet, Bradley, Royce, Croce—and all of them have been ethically-religiously motivated. But the other movement—represented most prominently by English empiricism—arising with science and traveling with it *pari passu* has concerned itself in the first instance with the problem of knowledge. When John Locke was importuned by

friends to write an ethics that would match the acumen of his famous essay he replied after many sympathetic postponements that as long as the golden rule was available it was not of primary importance to write a speculative treatise upon ethics. This early modern tendency of the empirical philosophy to regard ethics as purely a practical matter and to conceive practice as wholesomely determined by already available principles, largely religious, marked the predilection of most English philosophy until the rise of the utilitarian movement.

Utilitarianism was only speciously an exception to this attitude; for while it was paramently ethical in emphasis it did not seek speculatively to constitute the principles in terms of which the moral life was to be maintained. Rather it took natural goods—utility, pleasure—as being the final goods and concerned itself with the engineering problem of how to distribute them more justly. In this it was but typical of the tendency of the social sciences in imitation of the natural sciences to break away from the earlier ethico-religious outlook. Giving primary attention thus to means rather than to ends utilitarianism condemned ethics to the service of what may well have been not so much critical standards as outmoded values.

The most persistent question to which political philosophy has attempted an answer is that of the basis of authority. The rise of the state through contract or otherwise, the nature and transfer of sovereignty, the boundaries of fruitful control, the spread of political participation—these and other such questions in the history of political theory are but diverse ways of stating the essentially ethical motif that lies at the heart of politics, the problem, as T. H. Green has it, of “the principles of political obligation.” As this ground has, in L. T. Hobhouse’s terms, shifted from “kinship” through external “authority” to the broadened internal base of “citizenship,” the ethical element of politics has evolved from customary morality to a loyalty rationally conceived and freely chosen. The democratic doctrines of government by consent, of freedom of contract and of speech and of a common good that in nature is universal mark the unabashed florescence of ethics in politics.

In no conflict, however bitterly contested, has ethical conviction ever been the monopoly of either side. Indeed, the more severe the conflict of interest, the more desperate the need

the more certain are the issues at stake, whether economic or otherwise, to be conceived as ethical. Since ethics operates with opposed notions of good and bad, right and wrong, it is in the nature of ethical judgments to condemn the antithesis of what they approve. But to condemn does not forthwith abolish: one's enemy remains in spite of disapproval, unless he can be physically killed off; and the forces of opposition to ethical judgments were early discovered to reach further than such summary physical power. Nature herself took sides, and spirits teemed to succor or to subvert. The appeal to magical and then to religious sanctions for moral support was a way of maintaining morale in the absence of physical potency. If the gods—with their postulated reserves of power—stood with one, one's disapprovals would be at the last effectively approved. Historically, however, there has been strategy as well as power in the religious sanctioning of moral ideals. We have seen already how the idealizing process tends to match insuperable difficulties with affirmational excess. The discrepancy between sexual desire and sexual satisfaction, for example, begot in the Middle Ages an ideal of purity that stopped not short of the demand for complete continence. But not only was God's fairest creature everywhere an enemy of this ideal, as the church fathers pathetically acknowledged, but one's worst enemies here are of his own household. Then must the religious sanction for this moral ideal be tempered with mercy. Apply the rigorous ideal to only a few, being merciful when they fall; and grant to the many the rewards of virtue for a life admittedly second best. Religious institutions have not only in this fashion sanctioned moral ideals which otherwise would have been suspended impotently in mid-air but have also mediated with mercy the rigor of ideal demands. God knows man's weakness as well as approves his strength, and the failure of natural virtue will not be allowed to thwart supernatural grace. How far this humane mediation reaches may be seen by contrasting Christian ethics with Kantian ethics. Although Kant built upon Christian presuppositions he sought a "religion within the boundary of pure reason." The morality that emerged from such confinement—obedience to universal law purely for the sake of the law—exacted a perfection that Kant himself admitted could perhaps not be found. It exacted, in short, the impossible with no leniency to render the impossible tolerable. The

casuistry of scholastic ethics, on the other side, only dimly obscured with subtle proliferations such divine mercy as rendered perfectionistic ethics possible by making it tolerable.

The truth, however, that ideals outrun physical facts—outrun them if uncontrolled to such marvelous excess as demands both religious sanctions and the divine softening of them—does not mean that ideals do not rationalize physical forces, i.e. both arise from and justify them. Religion has always taken sides on what it regarded as crucial issues, giving promise, moreover, of substantial succor to those who would stand fast with the angels. Through sufficient disillusion with such promises either in themselves or in the temporal latitude they allow for fulfilment men may, however, come to limit the idealizing process in the name of practicability. With such limitation "utopian" ethics gives way to "scientific" ethics. This shift really became sincere in western culture only with the work of Karl Marx. As Marx saw it, the early democratic ethic was utopian. It did not even systematically renounce divine aid; in more minds than merely Rousseau's and Godwin's it looked forward hazily and happily to an impossible perfectibility of human nature. Besides, the democratic ethic did not clearly discern the natural history of ideals themselves and so did not see that the conflict of moral ideals is, in a world of limited goods and unlimited wants, little but the struggle for concrete advantage deflected to a realm of temporarily postponed response. The positive illusion that arises from this latter impercipientia is clearly manifest in democratic writing—not more in the ad hoc appeal of the American Declaration of Independence than in the economic doctrine of Adam Smith—in the form of the immature conviction that if all men were but equally honest every issue could be harmoniously adjusted. Great credit therefore belongs to Karl Marx not only for seeing but equally for saying what a natural history of ideals implies.

It generally passes for ethical advance to have subordinated the conceptions of right and duty to the notion of good. It is largely taken for a deepening of insight to see further that the idea of good is integrally tied up with the fact of goods. But it is less frequently seen that right and duty imply that goodness is dynamic and that, being so, it stands in need of a creative technology. It was the most noticeable social function of a "duty" ethics whether Christian

or Kantian to facilitate the maintenance of the economic and institutional status quo. It was the most noticeable function of the democratic ethic, emphasizing good as meaning the right to have and to hold goods, to win through revolution, if impossible through discussion, the goods in question for the status quo. But just as early science fitted its new instruments and transforming functions into old and static conceptions of the old world, so the scientific ethic adapted itself to a fixed notion of good. The utilitarian ethic—taken as the most acceptable formulation of the modern democratic movement—saw basically no distinction between natural and moral good; they both alike were pleasure. And since pleasure is afforded man by nature, Bentham, for instance, saw no way to enforce a moral distribution of this natural good—“each one to count for one and no one for more than one”—save an appeal to sanctions that were almost as external in their operation as had been those of authoritarian ethics. And although Mill believed that a difference of quality in pleasure marks the line between natural and moral good, both qualities were, for want of any clear formulation he had of moral methodology, equally given to man. Moreover, the self-conscious scientific ethic of Marx is bellicose in its assumption that moral good is identical with natural good—all the more so because goods from which “good” borrows its meaning are defined by the materialistic interpretation of history. Although value itself not only derives from labor but is created by labor, goodness is pitched up automatically in the evolutionary process, to be distributed violently through revolutionary means rather than by being itself created through cooperative participation of human intelligence.

The basic point in common between authoritarian and democratic ethics is thus the assumption that moral goodness is identical with natural goodness and that natural goodness is limited so that distribution of it can as a matter of fact (as democracy in crucial instances) or as a matter of right (as Marxianism in general and communism in particular) come about only through violence. Now violence is on any showing not easily identified as itself a case of goodness. And so the pass to which contemporary ethics comes is that of seeing morality arise (although it is generally hoped that it will function independently of such genesis) only as a specific by-product of wholesale immorality. Can a classless society—assuming it to be the

desideratum—arise from the dead ashes of one class burned at the stake by another?

But to revert to the initial characterization of ethics as rationalism bent in the direction of conduct, it may be said that the renunciation of the traditional meaning of reasonable, which identified it with precedent, in favor of the democratic meaning, which identified it with the desirable, seems in the analysis thus far to introduce the necessity of seeking the desirable through means themselves more undesirable than custom, convention, institutionalism, could ever be. The crucial problem of contemporary ethics—as communism and capitalism stand facing each other, steadfast each in its own convictions—is whether goodness can be ethically arrived at. In the light of the analogy with economic goods—which have been found to differ from natural goods by the potency of human initiative and ingenuity to make from the one an unlimited quantity of the other—this problem would seem to turn on the question as to whether moral goodness does not differ from natural goodness in the same way, i.e. by the mediation of human ingenuity and initiative. The analogy is strengthened by the modern assimilation of “good” to goods.

The newest contender for ethical honors—pragmatic ethics—seeks systematically to develop this contention. Its critics have sought either to reduce it back to institutional acquiescence or to foist upon its spirit of revolt responsibility for the violence of Fascism and Bolshevism, but John Dewey, its chief expounder, has insisted that it is a *res media* between institutional conservatism and revolutionary radicalism. The point at which it is claimed that the pragmatic emphasis represents an ethical advance is the creative role of intelligence with reference to moral good. To hold that there is a moral good which comes to be only through judgment is negatively to brand as totally inadequate both the traditional duty ethics and the hedonistic doctrine of the good: the former because it provides intelligence from without with standards so superior as to reduce reason to the slavish role of mere acknowledgment and application; the latter because it provides non-reflective elements of natural experience. If the natural good—as identified by mere liking, want, desire and the like—is the only good, then there is no moral good; and ethics is pure rationalization of caprice or power. If, however, there is in addition a moral good, then it must be either derived from the outside

or created through the incidence of intelligence upon the natural good. In the former case duty again functions through nondescript conscience or the command of some superior power operating through sovereignty either human or divine.

If the pragmatist be logically right in holding intelligence as judgment to function only in problematic situations and if a problematic situation be conceived by him as a juncture of conduct in which there are present no goods sufficiently unambiguous to motivate action, then to make up one's mind as to what to do is to instigate action that would not have been but for the thinking. Now if we add that for man, an animal primarily more motor than rational, all values are activities (although for purposes of simplification the emphasis may be put upon feelings that accompany or satisfactions that complete activities), then we arrive through specific and definite thinking at goods that in no sense were prior to, but that literally are created by, intelligence in its normal exercise. If the only values that ethics can discover to man are either the natural, animal kind or the supernatural, religious kind, then must not man remain forever either a gluttonous brute offending the deity that flickers through his aspirations or a fallen angel struggling with his brute nature through the heroic failure of successive renunciations? But if there happens naturally to man as the legacy of fortunate variations in the long struggle for survival a genuine alternative both to groveling and to renunciation, he may, if he can but summon faith in the creative efficacy of his own efforts, persuade others to share or improve his vision of a better way of life than that out of which the vision arises. If this be possible, activities may result more generous than competition or acquisition; and they may be accompanied by feelings more pleasurable for self and less costly in pain for others. Professional ethics feebly exemplified the principle which if put courageously to work might, it is claimed, rehabilitate ethical theory by making it vital in moral practise. Instead of the ethical *laissez faire* of *de gustibus non est disputandum* there is proposed by pragmatic ethics the doctrine that natural goods are but candidates for ethical honors—honors to be awarded only upon critical proof that the natural goods will stand the wear of time through public scrutiny. Only in this way, say the pragmatists, can the social sciences claim the honor that is rightly theirs, the honor of

vitalizing knowledge by practise and of informing practise with insight. This doctrine may be but the latest ethical distress signal—a signal given by morality at the contemporary cross-roads—or it may be a genuine creative synthesis of authoritarian and naturalistic traditions in ethics. But at any rate there is a growing fear that, unless some effective synthesis does emerge, the impending conflict between the mutually desperate convictions of bourgeoisie and proletarian moralities may abolish all ethics in a wholesale crucifixion of the human race.

ETHICS, PROFESSIONAL. *See* PROFESSIONAL ETHICS.

ETHNIC COMMUNITIES are groups bound together by common ties of race, nationality or culture, living together within an alien civilization but remaining culturally distinct. They may occupy a position of self-sufficient isolation or they may have extensive dealings with the surrounding population while retaining a separate identity. In its strict meaning the word ethnic denotes race; but when applied to communities in the above sense it is loosely used, in the absence of any other comprehensive term, to cover the more general concept of culture. Purely religious communities, such as the Mormons or the Shakers, or economic communities, like the New Harmony or Brook Farm groups, do not fall under the term although they are in many respects similar to the groups here discussed. Groups possessing a single point of cultural divergence or functionally distinct, like monastic or university units, share with ethnic communities the quality of being in other communities without being of them, but they lack many features of those communities which are bound together by a traditional culture complex.

Such communities vary according to their origin, their cohesive factors, the attitudes of the outer community, and the nature of the civilization of which they are a part. They tried to survive by reason of self-consciousness produced by divergence and through the tenacity of their social institutions. In major group migrations ethnic communities may be created because the exodus of one people to make way for another is rarely complete. Very frequently the remnant of the old does not lose its identity, and although it becomes merged with the oncoming multitudes it retains its ancient customs, its language and its group consciousness intact. Eastern Europe is full of such communities surviving from the waves of Teutonic and Slavic migration in the early centuries of the Christian era. Efforts to rectify boundaries at the close of the World War were impeded, especially in Transylvania, by the presence of just such self-conscious com-

munities, owing their origin to population movements more than a thousand years before. Still older communities are to be found in the Near and Middle East, where centuries of population movement have left their traces in a tangled mass of unamalgamated units living in close juxtaposition to one another. The Turkish Republic has found these communities a major obstacle to the development of its national character and has endeavored by exchange of populations to rid itself of elements which the old empire had been unable to assimilate.

Communities originating from migration movements survive chiefly through their own cohesion and their resistance to assimilation. Where communities are created through military conquest they are more apt to be forced into existence by the command of the dominant group, as when conquering invaders expropriate a subjected land and set aside an area to which the native population is segregated. In the United States, Indian reservations were created in this way and were so completely endowed with a community character that until recent years American law dealt with them only as tribes, not as individuals. Native quarters are familiar features of cities where an alien has taken forcible possession. Such communities tend to hold a definitely lower social status than those arising from migration, as they are conquered groups and not simply minorities. Where a people has been sent into captivity as a group, as the Jews in Babylon, or have been individually enslaved, as the Negroes in America, ethnic communities may develop in quite different ways. The Jews in Babylon drew closer their tribal bonds, defined more consciously their culture pattern, recorded their history, laws and customs and emerged from captivity with their traditional culture strengthened. The American Negroes, however, isolated and without leadership, drawn from different tribes which did not even speak the same language and bound together only by a common color and status, have built out of the culture of their captors a new culture, indigenously American but distinctively Negro.

Administrative and trading groups in foreign, usually "backward," countries may be considered ethnic communities. With a personnel which is largely transient and a status equal if not definitely superior to that of the general community, they deliberately and as a matter of political policy set themselves apart in order to maintain their prestige and conserve their

culture. The largest and most famous of such communities are to be found in the Far East, where the English quarter of an Indian city is as distinct as a Chinatown in America. In most modern European colonies this policy is aided by racial distinctiveness, but in the absence of marked dissimilarity it becomes necessary to resort to force. The famous Statute of Kilkenny forbidding the English of the Pale to intermarry with the Irish whom they were administering was prompted by fear that the governing body would be absorbed into the country and political control be lost. The color legislation of the Union of South Africa, distinguishing the whites, the colored and the natives, is a similar effort on a larger scale to keep the governing group from being undermined by the encroachments of a growing mixed element. Trading colonies, although not backed by the same political force, have been similarly imposed upon the area in which they are located and remain separate because of superiority, not simply because of difference. The "factories" of the East India companies in India, the outposts of progress along the jungle rivers of Africa and the imposing settlement of Shanghai with its European laws, its English speech and its complete separateness from the corresponding native town, all represent a more powerful material culture and are indirectly allied to more powerful political states.

Military groups accompanying administrative units or invading an alien territory have sometimes settled permanently or have been left behind when the main army has been withdrawn. Herodotus ascribes the origin of certain Egyptian communities which he found in Asia Minor to the passage of Egyptian armies through the land. Such remnants are more apt to form communities when women have accompanied the army as camp followers. When soldiers take wives from the native population ethnic communities are likely to result only if their conquest has been made permanent and they have been in a position to form a separate caste for themselves and their half breed children. In the areas of the New World colonized by Spain and Portugal the mestizo population has occupied a status and lived a community life separate from that of the native Indians, but in time this mestizo element has imparted its culture to the whole country and its distinctiveness as a group has mainly disappeared.

The shifting of boundaries between modern nationalist states inevitably creates communities

culturally allied to their former and distinct from their new nationalities, as in Alsace-Lorraine and the southern Tyrol. Such communities have a distinctly different status from any of the separatist groups described above. Because they claim identity with a still independent national group they receive external support and look forward hopefully to the time when the turn of the political wheel may carry them to the other side of the frontier. Efforts to Germanize Alsace after 1870 could hardly hope for success while the statue of Strasbourg in Paris stood draped in black.

Communities of fugitives or of voluntary emigrants are familiar types today. Of the two a body of involuntary exiles is more apt to make a positive effort to retain its cultural identity. Among the more potent reasons why Jewish communities have remained distinct from their environment in eastern Europe and elsewhere is the fact that they have been communities of fugitives, not of voluntary emigrants; and their presence in any land has usually been due to the desire to escape from a worse situation elsewhere. Certain of the settlers in the American colonies, notably the German sects, and some of the groups going more recently to the interior of South America have set out with the intent of maintaining their own community life in the land of their adoption, but usually when emigrant communities retain their distinguishing features it is more by accident than by design. Such groups entering a wilderness may count on isolation to permit the survival of their own culture, but where the isolation of the wilderness has given way to the contacts of an industrial civilization the tendency of the alien to seek the reassurance and guidance of his own kind is responsible for community development. Such immigrant ghettos have been accepted in Canada as more or less permanent and have been encouraged by permission to use the language of the group in the schools, but in the United States these "little Italies" and "little Polands" have been denounced as evidences of the failure of the process of assimilation called for by national policies. By the act of immigration the immigrant voluntarily accepts the country to which he goes and he is expected to become an integral part of it. The persistence of ethnic communities under these circumstances is due in part to the degree of divergence between the dominant and the minority culture, in part to the size of the group and the nature of the bonds which hold it together but primarily to the re-

ception which the group receives, the status which it is accorded and the barriers which are raised against its members by the larger community. The survival of immigrant groups as ethnic communities may be very generally attributed to the attitudes of the country which they have entered.

The chief basis for cohesiveness is race. Physical difference which cannot be changed or concealed sets one group apart from another and marks any man who seeks to leave his community and become part of the surrounding culture. The Chinese who seeks to leave his Chinatown is under a severe handicap not experienced by the Italian who emerges from little Italy. Differences in color are conspicuous and count for more than those involving head form, which may interest the anthropologist. The importance of race varies not only with the degree of racial divergence but with the strength of race prejudice in the dominant group, a fact clearly displayed in the contrast between Anglo-Saxon and Spanish or Portuguese colonies. Race becomes more potent as a differentiating factor when reenforced by differences of culture or status. The American Negro is confined to certain occupations and excluded from full participation in American life partly because he started as a slave; his former servile status has strengthened the color line, forcing him to stay within his ethnic group.

Where no marked racial differences exist, cultural difference forms the basic cohesive bond and appearance merely supports cultural barriers. The cultural unit may be a tribal one, as in certain groups in the Near East, or it may derive from local tradition, as in the Tyrol and Alsace. Elsewhere a submerged national group such as the Poles, Slovaks or Czechs preserves its national culture. Most commonly, however, the cultural differences are those that obtain between the culture of the home state of the culture community and that of the new state, differences involving language, tradition, common interest in the land of origin, common pride and common customs. In the case of European quarters of eastern cities the culture represented is compositely occidental rather than the peculiar heritage of a single national group.

Supplementary to race and nationality the strongest reenforcing factors are language and religion, both of which are apt to be essential parts of the national culture complex. The development of national languages, coterminous, for the most part, with national states, has made

language a symbol of nationality as well as the vehicle of tradition. The retention of the traditional tongue is often the principal aim of those who seek to prevent an ethnic group from losing its identity, while the loss of that language is taken as a measure of amalgamation. It was largely through the preservation of the Polish language that the Poles retained their common identity for a hundred and fifty years under Russian, Austrian and German domination. In attempting to mold the Tyrol into an undifferentiated province of the Italian state the principal drive has been against the use of the German language and has been carried to the point of changing the place names to their Italian form or an Italian substitute.

Religion, although less outwardly distinguishing than either race or language, is a peculiarly cementing force because of its institutional character and its possibilities for intellectual leadership. Its sustaining force is outstandingly displayed in the case of the Jews, where race, nationality and religion so combine that one scarcely knows whether to classify the Jewish group as religious, national or racial. Under adverse conditions in many lands the Jewish religion has been kept alive by pride of race, while the race has in turn been kept distinct by its common religious bond and religious leadership. Other groups show the same experience in a modified form. To the Armenians their church has been for centuries the symbol of their nationality. German Mennonites, Dunkers and other sectaries in the United States have remained distinctly German communities, while neighboring German farmers have lost their separate identity. Among the French of Canada the Catholic church has undoubtedly been the strongest factor in preserving their cultural community intact, while among recent immigrant groups in the United States it has played a similar role. Polish churches and parochial schools form the central institutions of many Polish communities in America. Even among the Irish, where no language factor has operated to keep the group apart, the identification of Irish with Catholic and the teaching of Irish history in parochial schools have helped strongly to prevent loss of identity and to keep the Irish after several generations a partially if not wholly distinct culture group.

Other elements of cohesion and differentiation support those already described, although none have the separative force of race, nationality, language or religion. Differences of eco-

conomic organization are occasionally important, most notably in the case of the gypsies, who have maintained their tribal organization, nomadic character and primitive economy in the midst of a sharply contrasting industrial civilization. More frequently it is difference of economic status rather than of organization which maintains the barrier between groups and prevents amalgamation. Those who wish to keep the American Negroes a distinct group recognize that the latter's economic status aids this purpose and oppose economic and professional advance on the part of the Negroes, knowing that it will weaken the barriers raised against them.

Certain institutions characteristic of particular groups reenforce other factors. The Sokols—gymnastic societies characteristic of certain Slavic groups—German *Turnvereine* and singing societies, Finnish cooperatives, all add a distinguishing quality to the life of the group. Distinctive customs—special ways of celebrating holidays, of arranging marriages or of conducting funerals—play their part. Distinctive food, as with the Jews, although seemingly of slight importance, aids considerably by marking those whose diet does not correspond with the prevailing one and by developing the business of supplying particular foods. To all these must be added the oral and written tradition of the group. Tradition is a very strong factor in communities that have remained in a fixed place to which traditions are attached—principally those communities created by conquest or political transfer. It is very much weaker in immigrant communities, where the traditions are often ill adapted to the new environment, where they do not have the place association which might otherwise keep them alive and where there is often no literate group necessary to perpetuate them.

Given these lines of cohesiveness as a basis for survival, the fate of ethnic communities depends further upon the leadership they generate, their isolation or contact, the attitude of the majority group and the economic and political texture of the society of which the community is a part. A major difference with regard to the pressure that has been exercised from the outside exists between ethnic communities of ancient or mediaeval times and those situated within modern nationalistic states. During the Middle Ages, when political and economic life was organized locally, the survival of ethnic entities was a matter of course. Trading communities of English in the Netherlands or the

German Hanse in London were set up by definite agreement. The Venetians demanded in return for assistance to the crusaders the right to establish trading posts within the cities of the East where their measures, laws and tongue should prevail. Throughout the western world the isolation of economic life and the particularism of political organization permitted the survival of self-contained, diverse units. With the beginnings of nationalist sentiment in the West the situation changed. Minority groups could retain or assert their self-determinant identity only against the drive of the dominant majorities for a uniform culture and single loyalty. Many of the present states of central Europe—not only the Czechs and the Slovaks but Poles, Ukrainians, Letts, Lithuanians, Croats, Slovenes and the various other succession states of the Hapsburg and Romanov empires—have grown out of the efforts to preserve a culture which was evolved in mediaeval isolation, was infused with modern nationalism and was granted political autonomy when the principle of national self-determination was applied to favored minority groups at the close of the World War.

These communities survived as potential states mainly through the conscious effort of their leaders to prevent loss of identity and in response to the repressive efforts of the dominant group. Their newspapers had been suppressed, their languages outlawed, their schools disbanded and their societies disrupted; but their priests and teachers had handed down for generations the history of their heroic past. Their leaders—a Kosciusko or a Kossuth—had raised the standard of rebellion and burned deep into the hearts of the people the brand of loyalty and the scars of defeat. In the isolation of the mountains, in the secrecy of homes or in the sacred precincts of the church the work of maintaining tradition has gone on and distinctive dress, speech, religious practises and customs have all been called into play to reenforce it. The Ukrainians, for instance, although adherents of the Roman Catholic church, have conducted their ritual in an archaic form of the Ukrainian speech lest by adopting the Latin form they become indistinct from their more powerful neighbors, the Poles. Although there is no adequate measure of the success of efforts to suppress such communities—and the process is still going on with respect to the new minorities created by the Versailles settlement—they have failed ultimately to accomplish their ends. A Polish priest, predicting

the rapid disappearance of Polish communities in America, summed up the reaction of his own people and of many others in the statement: "For a hundred and fifty years the Germans tried to force us to be Germans, so we are still Poles. The Americans do not care; we shall soon be Americans."

Ethnic communities produced by immigration are subjected to similar types of pressure as soon as they become large enough to awaken a sense of fear—not fear lest they rise in active political revolt but lest they deflect the development of a nation from its traditional channels and cause power and control to pass from the dominant to the submerged groups. In their relations to the indigenous Indian population the countries of the New World have encountered problems similar to those of the ancient migration founded communities of Europe, but with respect to later immigrant groups radically different relationships have arisen. In Canada the presence of an established French population which antedated the English induced a policy of tolerance toward other groups, their cultural autonomy being in a measure acknowledged through permission to retain their language for some official and educational purposes. In the United States, on the other hand, the system of public education with its almost universal use of English established the principle that the nation was to be unilingual and uncultural at base. The successful operation of this principle was taken for granted. It remained for the events of the World War to bring out the fact that the nation was not of one culture and one language and that neither Jacksonian democracy with its assertion of the similarity and equality of all nor the later theory of the melting pot had worked effectively. While the public schools were teaching in English, private schools, particularly certain parochial groups both Protestant and Catholic, were carrying on instruction in various foreign tongues; and both industrial centers and rural regions contained communities culturally distinct from their American surroundings and conscious of their separate identity.

These communities had developed and survived in part through the constant additions to their ranks from the stream of newly arrived immigrants and in part through the fact that the American people did not carry into practice their national theory of equality. Branding the members of these communities as "wops," "hunkies" or "kikes" they exerted social pressure to force them back into their ghettos, where they might

seek their place among their own kind. Of low economic status, without an intelligentsia (except in the case of the Jews), leaderless and with a tendency to lose successful members, since the price of success is often the severing of group ties, these immigrant communities hung on in most American cities, ignored by many and condemned by others as un-American. They have all developed certain characteristic features. In every case mutual benefit societies have been formed to assist members at times of sickness or death and incidentally to serve as social gathering places. In practically every case food stores and restaurants purveying the type of food familiar at home have served as centers where gossip is exchanged, news shared and the stereotypes of thought and action reenforced and preserved. In most communities a church follows the first signs of prosperity when the group is able to support a priest, for to many an immigrant his religion is the only experience which he can carry unchanged from his old home to his new. Whether or not a school follows the establishment of the church depends largely upon leadership, for the demand for education is far from universal among immigrants, who are often illiterate. The development of schools is most apt to be stimulated by religious authorities seeking either to preserve the religious affiliation of a group exposed to alien ways or to enable a particular church with its leaders to survive. Thus in certain communities Polish priests seeking to retain their parish membership among the second generation of immigrants have established parochial schools presided over by Polish nuns where the Polish language, history and traditions are taught. When not supported by religious leaders such schools are usually the work of organization officials who see in the younger generation the only way to maintain organizations which originally grew up to protect newcomers. Where a community is sufficiently large and literate, a press in the native tongue brings in the news of the old country, the gossip of the community itself and an interpretation of the affairs of the nation at large. Professional men of the group perform their services; traditional forms of entertainment develop; and the community becomes so complete that its members practically never leave it except to move from one such community to another, never think in other terms, never read American news, meet other people or in any way make contact with the outer community. Such isolation as this exists most conspicuously

in more or less separate industrial communities but is almost as characteristic of blocks in the ghettos of large cities. Although it can hardly remain so complete for more than one generation in a city, a new generation does not see the end of the old isolation.

It is characteristic of these American communities that they should be always on the move, each new wave of immigration or migration forcing an old community out of its old home and into a new one. The essential culture features, however, persist without reference to geographical location. It is also characteristic of these immigrant groups that they are more self-conscious in their areas of second settlement than in their original unit. It is only when they leave the ghetto that they know that they have been in it. If the area of second settlement has become completely developed as an ethnic community before they enter it, it may remain for a third or fourth move to make them realize that they have been part of a separatist entity in the midst of a larger whole.

These communities consist of a solid, group conscious nucleus, surrounded by a fringe which is gradually being worn away by intermarriage, education, participation in such activities as sports and by economic change. They are torn within themselves by conflicts between the generations, for the first generation of native born children, subjected to external influences, differs sharply in ways and attitudes from its parents. The internal factors holding the communities together are weakened wherever immigration has been reduced, and the attitude of the outer group bulks larger as a perpetuating force.

The World War had a very distinct effect upon the ethnic groups in America. It revealed to the American people that these communities not only had continued to exist but were of such proportions as to threaten the continued dominance of the old group. It called attention to the role that these communities may play as centers for propaganda by enemy or radical groups and showed them as bases for European operations by elements interested in political change in the old country. In consequence, it stimulated an active program of Americanization which developed into the campaign to assert Nordic superiority and resulted in the passage of the quota immigration law based on the assumption that certain ethnic groups can be assimilated into the American body politic more easily than others. At the same time the emphasis on self-determination and the birth of the many post-war na-

tions that grew out of the ethnic communities within the Hapsburg, Hohenzollern, Romanov and Ottoman dominions gave the nationals of those countries greater self-confidence. While removing from these groups the necessity of keeping alive the national sentiment for which they had been responsible when their nations were only countries of the mind, it gave backing and standing to members of these rejuvenated nations abroad. In response to talk of Nordic superiority leaders within immigrant communities have arisen to demand recognition for their groups, not merely for the exceptional individual. Such leaders are insisting that the amalgamation of ethnic groups into the American community must be by incorporation, not by suppression, and must proceed on the basis of respect for differences of inherited tradition and culture.

While America was becoming conscious of her ethnic groups, the nations of Europe proceeded on the assumption that ethnic communities are to remain characteristic of European life. The principle was recognized in the formation of the Minorities Commission of the League of Nations and in the treaty clauses requiring the defeated states to recognize their minority groups, although the victorious powers imposed no such obligations upon themselves. Soviet Russia has fostered cultural autonomy within the Soviet Union, encouraging Tartars, Cossacks, Jews or Armenians to develop their group consciousness and their cultural institutions upon their inherited soil or in newly created communities on land set apart for them by the government. Acceptance of the communist economic system is the only conformity required.

Meanwhile, the force of economic pressure is constantly at work, breaking down isolation, producing physical mobility, causing contacts between members of different groups and rewarding those who are successful at the economic game, with scant regard for the group from which they come. The same factors which are wearing down cultural differences between nations are at work to eliminate ethnic communities within states. Although a standardized, international language makes slight headway and although international bitterness keeps alive national self-consciousness between and within states, the diffusion of a standardized material culture, elimination of distance and the common language of business are all at work to make the ethnic community a relic of a separatist age. Its greatest opponent is the unconscious pres-

sure of an integrated economic society and a leveling material civilization.

ETHNOCENTRISM was first developed as a definite sociological concept by W. G. Sumner, who defines the term as that "view of things in which one's own group is the center of everything, and all others are scaled and rated with reference to it" (*Folkways*, p. 12-15). Emotionally it finds expression in a sympathetic awareness and approval of one's fellows and their ways (the "syngenism" of Gumpłowicz, the "we-feeling" of Cooley, the "consciousness of kind" of Giddings) and, *per contra*, in a feeling of fear, suspicion and contempt toward outsiders and their ways. Many writers have viewed ethnocentrism as the manifestation of a herd instinct, since there seems to inhere in it a quality of primary certitude which betrays its essentially irrational and primitive character and since an analogous form of group egotism prevails widely among those animals which live in societies (for the case of chimpanzees see Köhler, W., *The Mentality of Apes*, 2nd ed. New York 1927, p. 289-91). Whatever its possible innate basis, however, ethnocentrism emerges in human society as a cultural factor of considerable significance.

Each human group in its struggle for existence, security and survival in its peculiar natural and social environment arrives at certain habitual modes of behavior or folkways shown by experience to be reasonably adequate in satisfy-

ing those needs. And since departure from these ways usually results in pain or disaster they come to constitute a "prosperity policy" for the group. The folkways are further regarded as natural and right and any deviation from them as unnatural and wrong. When they receive the added sanctions of law and religion, deviation on the part of the group member becomes in addition criminal and wicked. Members of other groups, who follow other codes, are naturally looked upon as perverse, immoral, savage or heathen. Any difference, especially in culture, is rationalized as an evidence of the superiority of the "in group" and the inferiority of the "out group." Opprobrious and invidious epithets, such as "raw-eaters," "uncircumcised," "idolators," "the great unwashed," arise on the basis of such cultural differences. Tribal names imply ethnocentric sentiments in an astonishing proportion of cases. A people usually calls itself either by a flattering name or by a term signifying simply "men," "men of men," "first men" or "people." Aliens, on the other hand, are regarded as something less than men; they are styled "barbarians" or are known by some derogatory term corresponding to such modern American ethnic tags as "bohunk," "chink," "dago," "frog," "greaser," "nigger," "sheeny" and "wop."

But ethnocentrism is by no means confined to tribes and nations. It manifests itself in social groups of all kinds—families, sibs, phratries, local communities, classes, castes, sects, races, etc.—and assumes such diverse and developed forms as nationalism, patriotism and chauvinism, family pride, class consciousness, sectionalism, religious intolerance and race prejudice. Always the "we group" and its code are exalted, while "others groups" and their ways are viewed with suspicion, hostility and contempt. A religious group, for example, distinguishes its own members as the "faithful," the "true believers," the "chosen people," from the "infidel," the "heathen" and the "gentile."

The "in group" is also a peace group. Its members maintain law, order, government and industry among themselves. Rights develop originally in the "we group" and are extended only partially, if at all, to outsiders. Acts like murder and theft which are crimes or sins within the group are frequently regarded as permissible or even meritorious when committed against non-members—an attitude sometimes referred to as ethical dualism. The alien is usually granted at best only restricted rights of resi-

dence, occupation, property, franchise, legal redress, marriage and worship.

By focusing attention on cultural differences ethnocentrism strengthens and intensifies the folkways of a people. It is a factor securing loyalty to code. It promotes group cohesion and thus possesses survival value. An army or a football team, for example, fights hardest if it hates its enemy. Ethnocentrism also helps to maintain discipline and morale. Thus it is always accentuated when groups come into conflict. Dormant racial antipathies flare up in a race riot. Party loyalty is stressed at election time. Patriotism runs amuck in war, class antagonisms in strikes and revolutions and religious intolerance in sectarian struggles. In times of stress, in short, ethnocentrism is deliberately evoked by all the machinery of propaganda—an implicit recognition of its power.

Ethnocentrism fluctuates with the degree of contact and cultural divergence. It is enhanced where two groups come into contact in large numbers, especially if they enter into economic competition. Thus antisemitism flourishes in those countries where Jews are most numerous; it became prominent in the United States only with the large influx of Jewish immigrants from eastern Europe after 1880. Prejudice against Negroes is slighter in Europe than in America because contact with them is rarer. The "yellow peril" is feared chiefly in those regions where orientals are comparatively numerous and enter into economic competition with the whites. Ethnocentrism thrives on differences, not only those of race but also those of culture, and tends to be strongest where these are most pronounced. Witness here the traditional antagonism between animal herders and tillers of the soil and between city and country dwellers.

Ethnocentrism receives a strong support in the marked tendency of people to think in terms of groups rather than of individuals. It is far easier to label an individual with a class designation, such as Jew, capitalist or atheist, and thus to pigeonhole him once and for all than it is to arrive at a reasoned estimate of a complex personality, an estimate, moreover, which is necessarily tentative and subject to change with increasing acquaintance.

Phenomena such as lynching, exaggerated nationalism and the class struggle show that ethnocentric sentiments are probably as prevalent today as ever. There are nevertheless certain forces which seem to be operating to mitigate them. The international peace movement

and the eight hundred odd state and local committees affiliated with the Commission on Interracial Cooperation in the southern United States are outstanding examples of conscious efforts to assuage ethnic consciousness. More impersonal and unpremeditated forces like trade and economic contacts not involving competition make for peace and better understanding and work in the same direction. Travel develops tolerance of the outsider and his beliefs and practises. Improved techniques of communication stimulate diffusion and lessen cultural differences. Anything in fact that promotes understanding, toleration, catholicity and cosmopolitanism diminishes the force of ethnocentrism. Education may well play a prominent role in this connection, and no branch of education seems better fitted to promote intergroup understanding than the social sciences, which seek specifically to comprehend and explain cultural diversities.

ETHNOLOGY. *See* ANTHROPOLOGY; RACE.

ÉTIENNE, EUGÈNE (1844-1921), French politician and colonial administrator. Étienne, a follower of Gambetta in the Chamber of Deputies, became interested in the colonies first as a deputy of Oran, Algeria, and then as a reporter on the Algerian and colonial budgets. He followed his master, Ferry, in urging a coherent colonial theory on France and in his two memorable terms of office as undersecretary of state for the colonies (1887-88, 1889-92) oriented and fixed the principles of French colonial policy. Despite an alarmed majority in the Chamber and a recalcitrant public opinion he outlined an empire scheme in Africa. In a famous speech of

May, 1890, he contended that France had in Africa not a series of trading posts but an empire. He reduced Ferry's generalizations to a concrete program and was far ahead of his time in fixing the aim of France as dominion from the Congo to the Mediterranean, from the Chad to the sea. Moreover, he argued, all colonization in a world influenced by "that economic movement which has come out of America" must be guided solely by economic aims. Traders must be pushed to the front and industrialists must realize that it was to their interest to break down the prevailing anticolonialism of Clemenceau. These ideas Étienne carried out during his administration, which was the first period of independent and concerted direction the French had allowed their colonial rulers. During this period he gave practical expression to Ferry's theory that colonies were distinctly subordinate to the mother country in every way. He demonstrated this by his famous tariff law of 1892, the aim of which was to make the colonies simply contributory to the well-being of France, especially of its manufactures. The colonies were to provide raw materials and take manufactured goods in return; but no consideration was paid to them as entities having lives of their own. As part of this general policy of subordination Étienne was also responsible for the colonization of the Congo by large companies and for sending de Lanessan to Indo-China. In short, Étienne built up the organization of the empire, formed the colonial party in parliament and changed public opinion as to the value of colonial ventures.

ETIQUETTE is the body of forms of conventional decorum into which one's behavior is cast. In the western world etiquette is inculcated at such an early age that it becomes automatic and is therefore often mistaken for a reflex expression of emotions. Thus, standing to show respect is thought to be instinctive until peoples are found who show respect by sitting. Reflex mani-

festations of emotion, such as smiling, are invariable. Variable expressions of the same feeling are determined by conventions, most of which can be traced to ritual. Since ritual centers around divinity, so does etiquette. In the East especially, the forms observed toward great men and gods are generally identical.

Etiquette often consists in practises arising from the belief that the superior equals a god. The king of Tahiti was a sky god; therefore his houses were called the clouds of heaven; the rainbow was the name of the canoe in which he voyaged. This is no doubt the origin of much court language. The archaic Indian and modern Polynesian custom of sitting in the presence of a great man applies the principle that a mere man cannot be above heaven, as represented by the king. The god is addressed through the king; hence such forms as "he" or "the god" are employed for "you." The use of the third person in conventional address is still a common survival on the continent of Europe, although its original meaning has been lost.

Many observances are based on difference in rank. The priests, governors and chieftains are considered divine; but the king's divinity includes theirs so they do not use the signs of divinity in his presence. People who commonly use chairs therefore stand in presence of the superior, because the chair was originally a throne reserved for the head of the ceremonial. The same rule explains the removal of the hat. In India all who take part in worship must wear their insignia; and as the court is considered a temple, dignitaries must wear their hats at court. The European army has adopted this principle in the wearing of the hat in the presence of superiors. In the ancient world a guest is accompanied by a god; in India he is "compounded of all the gods" and is accordingly granted precedence and honors although he may be of a rank inferior to his host.

Etiquette sometimes requires the avoidance of any word or act which may cause evil supernaturally, such as averting the gaze from people at their food, so as not to bring the evil eye to bear on it; not pointing the finger for fear of blasting; not using words of ill omen. In other cases the original idea seems to have been to avert evil from one's own self, as when a man covers his yawn with his hand to prevent life from escaping. Indecency, although not wholly a matter of convention, is variously defined in different cultures and the practises relating to its avoidance are diverse. Convention, for ex-

ample, determined that a Fijian might go naked before circumcision but not afterward. Etiquette sometimes prescribes obscenities on certain occasions and between certain individuals as, for instance, between cross cousins.

The meaning of etiquette is weakened when it spreads to all classes. Prayers for the success, health and prosperity of the chief, such as "conquer," "live a thousand years," "health," "peace," dwindle from rites with the definite purpose of insuring prosperity to empty but pleasing forms. "Good morning" is no longer thought to promote welfare but is meant to be an expression of good will; being obligatory it ceases even to be a certain index of feelings. Nevertheless, it fulfils a useful function. Among peoples who have no greetings one misses the opportunity of expressing one's feelings by intonation or facial expression. Any form of words might serve this purpose but set forms are necessary, for one's ingenuity would be taxed if one had to vary the form continually. Attempts are sometimes made to introduce new forms, such as the recent use of the greeting "cheerio," but these innovations rarely last and the classic forms survive them.

Etiquette also fosters feelings, for feelings require external stimuli for their development. Words of thanks, although obligatory and not necessarily inspired by feeling, remind the speaker of his indebtedness to others. The power of etiquette to develop sentiments is seen in the army, where constant honors to the higher ranks breed in the old soldiers not only a feeling of respect but a pride in that respect. Etiquette also acts as a check on impetuous behavior by developing self-control.

Propitiation, which was one of the chief objects of the ritual of which etiquette is the survival, has left an impress on its present form, which is mainly directed toward evoking favorable emotions in others. Observances originated to react on nature are continued for the sake of their effects on others: for instance, a yawn is covered because the inside of the mouth is not pleasant to view; pointing is avoided because it is too personal; the use of the second person singular is thought to be too direct. Not only do old forms receive new meanings through rationalization, but new ones are created by analogy: thus the indelicacy of opening one's mouth widely is extended to eating.

Etiquette has developed from ceremonial to tact. In the early forms etiquette often disregards the comfort of the recipient; later it tends

to be subordinated to it. Thus it is Fijian etiquette for kinsmen to visit the sick and for the owner of the house to entertain them even till late in the night, at the expense of the patient's rest. Visits to the sick in modern societies are subordinated to medical considerations. The greater elasticity and subtlety of the etiquette of the western world disguises it and gives an erroneous impression that less exists than among many savages.

Etiquette always involves respect for the person to whom it is addressed. A breach of etiquette is therefore resented as a slight. This consequence may be avoided if the person who commits it excuses himself—that is, gives a sufficient reason for his act, making it clear that no insult was intended. The basis of respect is obscured in the forms of etiquette known as professional; e.g. medical etiquette. This is really a code of honor; but the profession as a whole takes cognizance of its infringements, since they reflect discredit on the profession.

In all cultures those who are constantly in attendance on rulers are most adept at etiquette. The feeling of mastery over the art gives a sense of superiority and a tendency to cultivate etiquette for the sake of that feeling. The purpose in cultivating the technique is apt to be forgotten, and the forms of etiquette are so over-elaborated that instead of smoothing action they impede it. Etiquette then requires so much time to cultivate that it becomes inconsistent with hard work. People addicted to it in excess succumb to a ruder people more direct in its aims, as in the case of the French Revolution. At the end of the eighteenth century the increase of population in Europe and the development of machinery accelerated the tempo of life and made it necessary to simplify behavior in order to save time. Commerce adapted itself more quickly than government, which, having grown out of the court, is more conservative and clings to cumbrous forms of etiquette such as "I have the honor to be . . ." Old forms hold out longest in international relations, where small breaches of etiquette may be resented as national insults.

EUCKEN, RUDOLF CHRISTOPH (1846–1926), German philosopher. Eucken was reared in East Friesland in an atmosphere of liberal Protestantism. He studied at Göttingen and at Berlin under Trendelenburg and taught philosophy at Basel and Jena. In 1908 he received the Nobel Prize for literature.

Eucken accepted the idealistic argument against materialistic naturalism, positivism and mechanism but sought to replace the prevailing intellectualistic idealism based on the logical structure of science by an "activistic idealism" founded on a comprehensive and historical consideration of culture at large. In human culture not only intellectual categories but forms of a higher, autonomous personal life supervene upon natural processes and constitute what Eucken called the life of the spirit (*Geistesleben*).

In social practise Eucken was opposed on the one hand to reliance on external mechanisms, such as political bureaucracy or socialistic economic organization, and on the other to the appeals of intellectualistic idealism to abstract moral principles and ideas like humanity. Although he valued nations and social classes, when not denatured, as larger complexes of personal life, he considered the achievement of the personal life itself, filled with spiritual content, as all important and significant. In numerous writings he sought to interpret the spiritual content of historic movements and to point out the necessity of utilizing science to overcome and permeate nature with such values of personal life as came to the fore in Christianity. Hereby he became the leading non-clerical, philosophical protagonist of liberal Protestantism and gained a wide hearing in England, Scandinavia and America as well as in Germany.

The philosophical sociology of Max Scheler, who was Eucken's most eminent pupil, the cultural psychology of Spranger and Spengler's history of culture illustrate an increasing tendency of German philosophy and social science to treat intellectual history as part of a wider cultural history and to explain the forms of

man's life less in terms of transcendental ideas than in terms of ultimate forms of activity (*Lebensformen*). Eucken himself did not develop this new cultural analysis but popularized related ideas in preaching the need of cultural renewal by activism.

EUGENICS deals with the science and practise of improving hereditary characteristics in man. The term was coined by Galton in 1883. It was at first designed to include improvements of stock in all organisms, but its application has become restricted to man.

The idea of the possible improvement of human stocks arose from the observation that men differ greatly in their abilities and qualities and that there is a tendency for particular characteristics to recur in descendants; hence it was inferred that superior offspring could be obtained by breeding from the best stock, as is the practise in cattle raising. This idea was expressed as early as the sixth century B.C. by the Greek poet Theognis. The earliest eugenic practises were directed toward improvement of the next generation through the destruction of infants that were sickly or deformed—a custom which has had wide distribution.

The ancient Spartans, a dominant race intermixed with a numerous subject population, practised a system of eugenic measures with the object of maintaining their dominance. They destroyed infants that were not promising, limited emigration of members of the dominant race, encouraged marriage among them, imposed penalties for celibacy, rewarded the production of offspring and at intervals killed off large numbers of the subject population. In

addition they imposed a severe regimen of life that doubtless had selective effect.

Plato at different times proposed diverse eugenic programs designed for an ideal state. He proposed that defective children and children from inferior parents should not be reared and chronic invalids and victims of self-indulgence should be denied medical aid. Moral degenerates were to be put to death; parental alcoholism was condemned as dangerous to offspring. Temporary unions of the best individuals were to be encouraged for the production of superior offspring. Since they had no knowledge of the segregation and recombination of genes, Plato and other writers of the ancient world attributed inferior children of superior parents to the ages of the parents and therefore advocated rules concerning the ages beyond which parents should not have offspring and proposed regulations regarding compatibility of ages at marriage. The eugenic measures were directed largely toward insuring physical superiority supposedly accompanied by mental superiority. In the early centuries of the Christian era and in mediaeval times interest in eugenics as in many other matters of science almost disappeared. In the early part of the seventeenth century the philosopher and monk Campanella (1568-1639) revived eugenic doctrines apparently based on those of Plato.

The modern eugenic movement is an outgrowth of scientific studies of heredity and variation. The prime mover was Francis Galton (1822-1911), whose works form the foundation for modern eugenics. Galton made genealogical studies which led him to the conclusion that talent and degeneracy are inherited, and he devised mathematical methods for measuring the degree of intensity of inheritance, on the basis of which he urged the importance of eugenic measures. His work was carried further by his associate and successor Karl Pearson. Galton and Pearson attempted to devise methods for predicting the average characteristics of later generations that are derived from selected parents of given type, in order to lay a foundation for the sound application of eugenic selection in man. By many investigations and publications they aroused interest in the subject in Great Britain. In 1904 Galton established at the University of London a research fellowship in eugenics, which developed into the Francis Galton Laboratory of National Eugenics, guided since 1907 by Pearson. This organization publishes memoirs, a lecture series and a

research journal called *Annals of Eugenics*. The Eugenics Education Society was founded in 1908; Galton, its honorary president, was later succeeded by Leonard Darwin, the son of Charles Darwin. It publishes a quarterly journal, the *Eugenics Review*, the best known of the journals devoted to eugenics, and has been active in examining proposed legislation with relation to possible eugenic consequences. Local branches of the society have been founded in many parts of the British Empire.

The pioneer in eugenics in the United States was Alexander Graham Bell. The present active eugenic movement was first organized by C. B. Davenport, largely under the influence of the English movement. Davenport founded in 1910 in connection with the Department of Genetics of the Carnegie Institution the Eugenics Record Office at Cold Spring Harbor, Long Island, New York, which collects and stores family histories and other data and publishes bulletins, reports and memoirs. In connection with it the Eugenics Research Association was founded, which publishes the *Eugenical News*. The American Eugenics Society, incorporated in 1926, has been active particularly in relation to the restriction and regulation of immigration to the United States. It publishes bulletins, pamphlets and since 1928 a monthly journal first called *Eugenics* but since March, 1931, published under the name *People*. Many universities and other educational institutions participate in the eugenic movement, which has spread widely in the United States, and some states have branches of the American Eugenics Society. The Race Betterment Foundation of Battle Creek, Michigan, which has held conferences in 1914, 1915 and 1928, the first and third of which published volumes of proceedings; the Human Betterment Foundation and the Institute of Family Relations, both of California; the Eugenics Education Society of Chicago; and the Galton Society of New York are also devoted to the promotion of eugenics.

There are active eugenic movements in Germany, France, Sweden, Italy, Czechoslovakia and the Soviet Union. An International Federation of Eugenic Organizations, whose official organ is also the *Eugenical News*, has held nine annual meetings. Two International Congresses of Eugenics have been held and their proceedings have been published. A third congress is to be held in New York City in 1932.

Eugenics assumes that certain types of individuals are socially more desirable than others.

and it proposes to improve future generations by increasing the proportion of individuals of desirable types through decreasing the rate of propagation of the inferior individuals (negative eugenics) and increasing that of the superior individuals (positive eugenics). Only for negative eugenics are the proposals definite and concrete. Certain types of seriously defective individuals are known to owe their origin to defective genes that are passed from parent to offspring. Such are some cases of feeble-mindedness, a few types of insanity, various deformities and certain diseased conditions, such as haemophilia and Huntington's chorea. Eugenists propose that propagation of individuals showing such defects shall be stopped, by means of segregation of the affected individuals or their sterilization, either through legal enactments or through voluntary action resulting from education as to the serious consequences of their propagation. A large number of the states have laws for the segregation or sterilization of defectives. In some of the states the laws have become a dead letter or have had little effect. In California an effective sterilization law has been in operation for many years, under which more than five thousand cases have been operated upon.

Prevention of the propagation of congenital defectives reduces the number of defectives in the next generation. The effect is greatest when the cases are due to defects of a single pair of genes and particularly when the defect is dominant, so that all the individuals that carry the defective genes are themselves defective. Completely preventing the propagation of such dominant defectives would result in their entire disappearance in the next generation, except when such defects are produced anew by mutation—an extremely rare occurrence. The more important heritable defects, however, including feeble-mindedness, are not dominant but recessive. Two types of individuals bear the defective genes: the defective individuals, who have two defective genes in a single pair, and a much larger group of "carriers"—normal persons who bear a single defective gene with a normal companion gene in the same pair. The larger proportion of the defective individuals in the next generation comes from normal carriers, whose number is not affected by preventing the propagation of the defective individuals. This measure therefore cannot completely eliminate the defectives. It is estimated that the prevention of the propagation of all feeble-minded in the United States would reduce the number in the

next generation only by about 11 percent if carriers are widely distributed in the population or up to 30 or 40 percent if the carriers are concentrated in small groups. In later generations preventing the propagation of the feeble-minded would have little further effect save to keep the number down to that already reached. Negative eugenic measures would be made more effective by the discovery of a method of detecting the normal carriers of defective genes; but this cannot now be done.

Medical examinations before marriage are sometimes required by laws directed mainly against the occurrence of venereal diseases in either of the parties, since this often results in imperfect children. The general enactment and thorough enforcement of such laws would undoubtedly save much misery, although most benefits derived therefrom would be classifiable as medical rather than as eugenic. There is some evidence that alcohol and certain lead compounds act injuriously on genes causing production of defective offspring, so that active measures against these "racial poisons" have at times been included in eugenic programs. The evidence on these matters is, however, not certain.

In addition to concrete measures of negative eugenics other proposals of less definite character are made. The rate of reproduction, it is pointed out, is higher in the groups that have been less successful in life and in those of less intellectual tastes and achievements. Thus "society is being recruited at the bottom," and under the assumption that success is positively correlated with biological ability it is held that gradual general deterioration of the race must result. To remedy this it is proposed that measures should be taken to increase the propagation of the successful and the intellectual classes and to decrease that of the classes that are less successful or less intellectual. Methods suggested are: that habitual criminals be not allowed to propagate; that the ban on dissemination of birth control information be removed, so that such knowledge may become available to the less efficient or intelligent groups; that the economic status of the intellectual groups be raised, so that they can afford larger families. Further, by education and by the general dissemination of eugenic knowledge both the "inferior" and "superior" groups would be brought to appreciate the situation and by voluntary action they would play their appropriate parts in remedying it. A large share of the activity of eugenic organizations is devoted to

educational work that shall tend toward this end.

There have been exaggerated hopes as to the efficacy of eugenic procedures. The rapid disappearance of criminality and other delinquencies and the solution of many of the major problems of society have been predicted. Such hopes of immediate results are based on an inadequate conception of the methods of hereditary transmission and of the role of environmental influence in human life. In producing offspring the parental combinations of genes are broken up and a new combination made for the child by taking in a somewhat random way half the genes from each parent. As the number of genes is large, the number of possible combinations is very great. In consequence each child receives a combination of genes different from any other (save in the rare cases of identical twins) and different from either parental combination. Each child therefore differs in his inborn characteristics from the parents and from the other children of the family. Thus parents of a given type may produce offspring of very different types. This presents a serious difficulty for eugenic selection, making its results uncertain and slow. There is, however, a degree of correlation in the characteristics of parents and offspring, for if a large number of parents of any type is selected, their offspring on the average approach more nearly to this selected type than do the offspring of parents not so selected. Thus, by selecting on a large scale parents having a desired type of characteristics, increasing their rate of propagation and decreasing that of other types, the later generations may be caused to approach, however gradually, the type for which selection is practised. The process of causing a change of this character is, however, very slow. Even if it were possible to select rigidly, to mate together only individuals having in a high degree the selected characteristics and to inbreed offspring of the selected type (following the procedures employed with cattle), many generations would be required for the production of marked and uniform results. When all that is practicable is to make a slight difference in the rate of propagation of the two classes, progress toward the proposed goal is extremely slow.

Furthermore, most of the qualities on which the social value of individuals depends are deeply affected by diversities of environment; by diversities in physical and economic conditions, in education, traditions, state of civilization and the like. In so far as differences between an

"inferior" and a "superior" group are due to such diversities in nurture, increasing the propagation of one group and decreasing that of the other has no eugenic effect. Some of the propagandists of eugenics have overestimated the proportion of diversities that are due to differences in genes, some going so far as to assume that practically all differences among individuals are due to gene differences and so are affected by selective breeding. From this it is a short step to the conclusion that the only possible method of improving social conditions is through eugenics. Some critics of eugenics have been equally extreme in holding that all differences between individuals that are important for society are the result of differences in nurture, that diversity of genetic constitution plays no role and that therefore selective breeding can have no effect. The study of genetics shows, however, that all kinds of characteristics of organisms without exception are deeply affected by the genes: differences in genes may produce diversities in any and every respect. This is demonstrated for man by the studies of the genetically duplicate individuals known as identical twins as compared with other individuals and particularly with other types of twins. The work of Müller, Newman, Lange and others on twins has demonstrated that all kinds of human characteristics—physical, physiological, mental, moral, social—are deeply influenced by the genes received by the individual at the beginning of life. The distinctive characteristics of any large group selected for certain qualities are due partly to their distinctive gene combinations and partly to the conditions under which they have developed. Because of the presence of the genetic factors there will be a correlation between the inborn characteristics of the parents and those of the offspring. Thus rigid selection practised on a large scale for any type of characteristics will cause later generations slowly to approximate this type.

In fixing upon certain types of individuals as undesirable and others as desirable there is little difficulty when only extreme cases are considered. Feeble-minded, insane, deformed or other markedly defective individuals are clearly less desirable than normal ones, and there is little dissent from the view that the propagation of such groups is not to be encouraged if the defects are congenital. Beyond this the common assumptions of eugenicists are that vigor and health are more desirable than weakness and proneness to disease and that higher degrees of

efficiency, adaptability and intelligence are more desirable than lower degrees. It is mainly in deciding concretely what individuals fall within the preferred groups that question and dissension arise. Success under the present economic system may be considered an indication of superior efficiency; yet some hold that this is not evidence of greater fitness under other systems that may prevail in the future and that therefore selection based on this system would not be eugenic in effect. National and racial prejudices have entered largely into eugenic propaganda. One of the commonest objectives has been the maintenance of the purity or the dominance of a certain racial or national group—the group selected for preference being that to which the selectors belong. This factor has entered largely into the eugenic agitation for restriction of immigration. Both racial arrogance and the desire to justify present social systems find a congenial field in eugenic propaganda.

In spite of difficulties and aberrations the better considered aims of eugenics, as presented, for example, in Leonard Darwin's *What is Eugenics?*, may be held as desirable and their realization to some degree not out of the range of possibility. In ridding society of certain classes of seriously defective individuals negative eugenic measures in the present state of knowledge can do more than can be done in any other way, and there is reason to believe that with an increase in knowledge they may become much more discriminating and effective.

EUHEMEROS, Greek philosopher of the third century B.C. Euhemerus was the author of a philosophic mythological romance known as *Ἱερὰ ἀναγραφὴ* (Sacred history), of which but fragments are extant. In it the folk deities are referred to rationalistically as famous kings of old who have been deified on account of their deeds. Euhemerus pretends that he came upon this epic tale, composed by Zeus and Hermes themselves, in one of his distant voyages, on an island called Panchaea in the Indian Ocean. The local color for the portrayal of life on Panchaea is borrowed from romances of travel and adventure, accounts of the lands of fabulous tales and magic and from his studies of political utopias; throughout the narrative everything that is too fantastic and improbable is struck out in order to insure the credibility of the tale. State socialistic practises of oriental and Hellenistic kingdoms are included. Socialist conditions are taken for granted. Private property does not exist as regards the greater part of the land; the herds are the collective property of the state; peasants and herdsmen deliver up their products, which are distributed to the consumers by the priests, who seem to be the ruling class. The social organism is tripartite, as in Plato's *Republic* and in the Abderite Hekataios' portrayal of ancient Egyptian conditions. It is possible that Euhemerus' system is a mixture of these two, which would account for the strange social classification: priests and handicraftsmen, peasants, soldiers and herdsmen. The collectivism is of a moderate form, which accords with the tendency to eliminate the seemingly impossible. House and garden remain in private hands; monogamy and the family prevail. Incentive for private economic initiative is afforded by the awarding of premiums to the best producers. The priests receive double rations. The trades are not organized along cooperative lines but remain as individual occupations. The discussion of the questions of ownership of movable property and of industrial production is obscure; for this either Euhemerus himself or the fragmentary condition in which his work has been preserved may be responsible.

Euhemerus had no interest in practical social reform.

EURIPIDES (480-406 B.C., neither date quite certain), last of the three great tragic poets of Athens. He was well born, and as his plays reveal him a master of rhetoric and argumentation he might have aspired to political honors, the grand object of ambition in the city-states of antiquity. To say that he preferred to be a poet is not the complete explanation it would be in modern times; it was, for instance, on the strength of his poetry that Sophocles, the elder rival of Euripides, was made a general. Nor was the cause lack of interest in public affairs—so much is plain to every reader of the tragedies. The explanation probably lies for the most part in the temperament of Euripides. He was a man of studious and retiring disposition—an unpopular type in democratic Athens—who had at the same time radical views on many subjects and a powerfully exciting genius for giving them dramatic expression. It is not men of that kind who fill the high offices of state.

His early years were cast in the exultant period when Athens was extending and consolidating that culture out of which has grown (with whatever modifications) the civilization of Europe and America. Its watchword was liberty (*ἐλευθερία*), defined as the reign of law, in opposition to anarchy on the one hand and tyranny on the other. In the political field this immense effort produced two things, perhaps incompatible: an empire and a democratic idealism. It may be that Euripides never much liked the empire, but he undoubtedly shared the idealism. (It comes out markedly in the *Heraclidae* and the *Supplikes*.) But gradually disillusion came; it touches nearly all the later dramas. The spirit of Athenian public life under the terrible strain of the long Peloponnesian War (431-405 B.C.) suffered a change which was deeply repugnant to the poet, who hated injustice more than anything else in the world. All the familiar phenomena of the war spirit re-

vealed themselves. Nobody now believed in liberty, except for himself. To this democracy had come; and on this new thing the old man turned his back and went off to die in Macedonia. It was not he, it was his country or her rulers who had become reactionary.

It is nearly always the influences upon his youth which best explain a poet. Euripides had grown up in an age thrilled by the first great achievements of science. It was felt that there was a reason for everything and that the reason would soon be discovered. With this confident rationalism ran a strong current of moral indignation against a great deal of popular religion. In particular the traditional mythology came in for criticism. On Euripides these influences worked powerfully. His sympathy with the scientific thinkers was marked enough to get him called, like them, a "sophist"; while his treatment of the myths, which provided Greek tragedy with its subjects, disturbed more conservative or conventional minds. At the same time he was above all a poet and he could not forget the beauty of stories which perhaps he could not believe. Neither could he believe that reason explained everything in this mysterious world (see especially the *Bacchae*).

Another illuminating approach to the man and his views is in an understanding of the direction of his sympathies. He is never maudlin, he is sometimes grim; but it is possible that he occasionally tilts the balance a little too far in favor of the misunderstood and the oppressed. He loves to take a character—often a woman, a Phaedra or Medea—whom tradition has condemned and tries to understand the motives by probing obscure thought or feeling. With understanding comes sympathy, and with sympathy indignation against the triumphant "heroes," especially the conquering sort, who are likely in this poet's plays to turn out rather poor creatures after all. In this way Euripides made a kind of revaluation of ancient moral values, with the result that no poet has been more hated or more admired.

It was not his business to make practical proposals. What he did was to create or at least to precipitate feeling upon certain subjects. One of these was slavery. It was much in the thoughts of Euripides; he even wrote a whole play, the *Alexander*, on this question so vital to ancient society. If it be asked what he actually did for the slave, the answer is that he treated him as an individual with a personality, not as a chattel or even as the member of a class. It is the denial

of personality that is the fundamental wrong done to the slave, but the slaves in Euripides are studied in the same way as the free. It may be—it is not certain—that Plato would have abolished slavery; but Plato never shows any interest in slaves. When later Greek philosophers condemn slavery, as most of them do, it is not Plato they quote but Euripides.

Again, the position of women in Athens was anomalous. They were not regarded as in any way the equals of men; they were excluded from all the respectable professions and denied education. Nothing in Euripides struck his contemporaries so much as his attitude toward women. He seems to have been regarded in some quarters as a woman hater. Nowadays there is more danger of his being regarded as a feminist. The truth is that he was neither. He merely tried to understand women exactly as he tried to understand men. He does not idealize them; he pays them the higher compliment of taking them as he finds them. He has in consequence many hard and disillusionizing things to say about women—and it is often women who are made to say them—which no doubt hurt the feelings of those, including even Pericles, who held the view that women should be nicely spoken of but kept in their places. But Euripides utterly rejects this attitude. There is no doubt that he was indignant at the way women as a whole were treated by men; in one or two plays (notably the *Medea*) something like a sex war is proclaimed. At the same time he has a strong sense of their difference from men. The women in Euripides often puzzle the men, although the men do not seem to puzzle the women. What he did for them was to give them a chance to be themselves, whether good or bad, and not what men wanted them to be. There was now a woman question.

Euripides is a poet and there is consequently no use in looking to him for a systematic social or political philosophy. He is merely, it might be said, a protesting voice. But that voice was so eloquent and in the main so just that it more than any other single force created a new conscience among thinking men about such abuses as slavery, the oppression of women and the "rights" of conquest. No ancient poet except Homer is so much quoted by succeeding writers as Euripides; what he said was, in the modern phrase, "unforgettable." In that lies his sufficient importance.

EUROPEANIZATION. The term Europeanization is intended to express the effects on Asiatic, American and African cultures and civilizations of permeation by the peculiar social system set up in modern Europe as a consequence of the classical Renaissance, the Protestant Reformation and the industrial revolution. Europeanization may be expressed politically by imposing the idea of democracy, in the sense of parliamentary and party government, or of sovereignty, in the sense of suppression or subordination of all governmental organs to the sovereign state, or of nationality, by creating a semireligious solidarity in support of that sovereignty. It may be expressed economically by imposing ideas of individualistic capitalism, competition and control on communities enjoying more elaborate and equitable, but less productive and progressive, collectivist or communal civilizations; or industrially by substituting the factory and the foundry for the hand loom and home craft. It may be expressed in terms of education by convincing other continents of the advisability of acquiring attainments in European science to their material or even moral advantage, or by exposing the discipline of tribal tradition and training to dissipation by the gospel of the missionary, the goods of the trader and the good intentions of the administrator.

The effect of Europeanization on Asia has been, is being and will be very different in its course and in its consequences from its effects on the Americas and on Africa. Moreover its past and its possibilities in Asia are at the moment of much greater importance to the world than in the other continents. Whereas the tribal and communal cultures and civilizations of Africa are already dominated and will at last be destroyed by the impact of European individualism and industrialism, and whereas those of North and South America are similarly doomed by the impact of Anglo-Saxon colonization and by the permeation of Latin commercialization, in Asia, on the contrary, there has always been

a reciprocating ebb and flow between the individualism and industrialism, the commercialism and capitalism, of Christian civilization on the one hand and on the other the collectivism and communism, the militarism and mysticism of Islam or of Buddha. And while the alternatives presented to the American Indians and to the African Negroes or Arabs or Berbers have been Europeanization or extermination, these alternatives do not face the Asiatics.

The first Europeanization of Asia appears to have been effected by the Aryan stock in an easterly drift into Persia and India that began in the stone age and continued until the civilizations of Egypt, Babylonia, Persia and Greece reported it in reliable records. This Europeanization can also be discerned in early political treatises like the prophecies of the Old Testament and in the data provided by archaeological research. The excavations at Ur in Mesopotamia and at Sarun in India suggest that it was the invasion of an ancient and artistic culture by conquerors with a less complex, more competitive, culture. The last waves of this early Europeanization in the conquest of Egypt, Babylon and northern India were the invasions by the Aryan Persians under Cyrus (549-529 B.C.) and that by the Aryan Greeks and Macedonians under Alexander two centuries later. Even at this early date, before modern society and modern science had given European civilization its present practical characteristics, the fundamental and philosophic differences between the two continental cultures were clearly marked. The essentials of modern Europeanization may be found in the scientific Greek culture with its self-contained city-states in continuous conflict with one another and with its religion of individualism and nationalism, just as the elements of the Asiatic civilizations and social systems of last century may be found in the Asiatic empires of that age. It is not a mere coincidence that the philosophies and politics first imposed on the Asiatic empires in the present period of Europeanization are inspired by the ideas of Plato and Aristotle and by the institutions of Attic and Aegean civilizations.

The end of this epoch of Europeanization came with the wars between the Eurasian empires of Darius and Xerxes under Aryan leadership and the European city-states of the Aryan Greeks. Not for the last time did the eastward tide of Europeanization divide between Eurasian and European movements, and after some fluctuations the European recede in a westward

ebb. The conquests of Alexander the Great (336-323 B.C.), which extended a Hellenic empire to the frontiers of the empire of Darius and established the ideal of a world state, were a last European offensive that could not be consolidated. The Roman Empire in Asia, from 189 B.C. to 330 A.D., was never more than an offensive defensive, while its successors, the Greco-Byzantine Empire from 330 to 1204, the Latin Empire from 1204 to 1261 and the Greek Empire from 1261 to 1453, fought with forlorn hope against Asiatic ascendancy. The experiments in Europeanization of this epoch indicate by their very want of vitality a decline in the dominance of Europe. The feudal states set up in eastern Europe and western Asia as a result of the Latin conquest and the crusades were even more ephemeral than the Hellenistic states set up as a result of the conquests of Alexander. The tide was turning in favor of Asia.

As this article deals with Europeanization and as the Asiatication of Europe was a mere matter of conquest involving little colonization, only the main lines of the latter need be noted. Owing to the defense of the central bridge between Europe and Asia by the Byzantine Empire at Constantinople, which had become the citadel of science and civilization, the westward flow of the Asiatic hosts was diverted southward through north Africa into Spain and so into France and northward through Russia into the Balkans and as far as the Baltic. The later Mongolian nomad offensive was the least important, although it has left the most lasting influence—an influence largely responsible for the recent reannexation of this region to Asia. On the other hand, the Asiatication of north Africa and the Iberian Peninsula by the Semitic races under the impulse of Islam and the impetus of Arab conquest constitutes the main current of the history of civilization in the early Middle Ages. It reached its highest point in northern France, when it was stopped at Tours in 732 by Charles Martel and the Franks. By the time Constantinople fell in 1453 both these flanking offensives were in retreat; the later central advance of Asia from Constantinople into Europe was finally checked at Vienna in 1683 by Sobieski and the Poles. Thereupon the tide turned in favor of Europe, and there began the epoch of Europeanization which extended through the eighteenth and nineteenth centuries and into the twentieth century and which so established itself in history and politics as to be generally accepted as a permanent aspect of world progress,

This it most certainly has not been. One reason why the Asiatic Arabs, Turks and Kurds overran Europe is because their society was more civilized than that of Europe outside its two culture centers, the Eastern Empire on the Bosphorus and the Western Empire in northern Italy and southern Germany. Asia had a larger legacy of the learning of the Greeks, Egyptians and Babylonians. It had an efficient and equitable organization compared to which the western feudal system was crude and cruel. It had a religious solidarity and social relationship in Islam with far less of schism and civil strife than had the state churches. Even as late as the reign of Elizabeth a commission was sent from England to study the system and success of Ottoman justice. The introduction in war of light cavalry, heavy artillery and brass bands is due to Turkish warfare, just as Alexander borrowed from Asia his Macedonian phalanx.

The last advance of Europe into Asia was facilitated by the degeneration of the ruling class of the Ottoman Empire, which became a mere corrupt clique in Constantinople and lost its representative relationship first to the peoples—Turks, Greeks, Slavs, Arabs and Armenians—next to certain regions and then to the Islamic and Christian religions. The “eastern question,” which was the political phase of the problem of Europeanization, consisted in the conflict of the modern European scientific ideas and social institutions with the mediaeval Islamic state, which through the Ottoman Empire at Constantinople defended the ancient cultures, customs and codes of Asia much as the Byzantine Empire there had defended the ancient civilization of Europe against Asiatic innovation. Just as the divisions of Asia had delayed the fall of the Byzantine Empire, so the division of Europe between competitive national empires delayed the fall of the Ottoman Empire of the caliph sultan. All projects for partitioning the Ottoman Empire failed, from the one attempted in the eighteenth century by Catherine II and Pitt, when only the Russians and the British were involved, and that of the nineteenth century initiated by the czar Nicholas I, down to that attempted after the World War by the French, British and Italians. All such Europeanizations by conquest were hampered by the competitive imperialism of the Great Powers and were eventually checked by the nationalism of the constituent races. The successive efforts by each of the empires to establish and exploit the Ottoman Empire had as little success. The

French during the Napoleonic era became the patrons, professors and protectors of the Porte. The English under Stratford Canning tried to reconstruct the empire with their panacea of parliamentary party government and provincial autonomies. Later the Germans took on the task until the World War. All failed. The Islamic state in eastern Europe and western Asia was impenetrable to Europeanization by imperialism, mainly because it had already been permeated by European nationalism. The European empires were not prepared to further a partition of the empire among its constituent races as sovereign states, although at first this policy had been favored by the imperial patrons of those races, principally by Russia. The Ottoman Empire during the latter part of the last century was accordingly artificially maintained by European diplomacy to check the extension into Asia of Europeanization by nationalism.

Meantime imperialistic Europeanization was proceeding apace by two movements encircling Asia, one to the north, the other to the south. The Russian Empire, consisting of Asiatic communities Europeanized forcibly by Peter the Great, was extended eastward to the Pacific. It then advanced southward along a transcontinental front behind the dorsal ridge of Asia and over it, across the Caucasus into Central Asia and Persia and across the Altai and their related highlands into Mongolia, Manchuria and the Vladivostok region. Meanwhile the maritime empires of the British and French in the eighteenth century, following the lead and taking the place of the Portuguese in the sixteenth, and the Dutch in the seventeenth, effected settlements at all likely bases for commerce or colonization. In the course of the nineteenth century the British pushed their front forward into contact with that of the Russians in Persia, Afghanistan and central Asia, while China lay as a meaty bone of contention between the British in India, Hongkong and the treaty ports; the French in Cochin China; the Germans in Shantung; the Eurasian empires of Russia and Japan; and the Euramerican empire of the United States in the Pacific.

The sudden and sensational Europeanization of the Japanese, the most easterly and exclusive of the Asiatic races, was the earliest and most effective evidence that a country which would resist Europeanization prosecuted by imperialism that was a menace to popular liberties would rush into it when presented as nationalism. The Japanese, exposed in their islands to the pene-

tration of Europeanization not only directly and despotically from Europe but also indirectly and democratically through the United States, with an alien Asiatic culture and civilization borrowed from China, took over European civilization with ease and expedition. Within a generation Japan was not only a Europeanized nation but was competing with the European empires for expansion into Chinese Asia, seeking not merely commercial openings but the colonial outlets which were vital to its overflowing, underfed population. This westward expansion of the Japanese inevitably entailed a collision with the eastward expansion of the Russians, a conflict in which the British supported the islanders against their Russian rival, whose advance southward in Persia and central Asia menaced the *pax britannica* in India.

The defeat of an Asiatic China by a Europeanized and expansionist Japan in the Sino-Japanese war of 1894 satisfied all progressive Asiatics as to the practical advantages of European armaments. The disastrous defeat of the Russian imperial colossus, a Eurasian power, European in its capitalistic dominance but Asiatic in its corrupt decadence, by the new Japanese nation, European in its scientific efficiency although Asiatic in its collectivist energies, gave an impulse toward social and national Europeanization throughout Asia. Even before the World War this movement strained to the utmost the diplomatic dykes by which the powers were striving to dam back nationalism from overflow into Asia. For Asia had by the beginning of the twentieth century realized that the only defense against an imperialistic Europeanization which would exploit Asiatic peoples in the interest of European plutocracy was a nationalistic Europeanization that would establish each Asiatic people on an equality of military, monetary and mental advantage. The results of this voluntary Europeanization, whether national or social, may be distinguished under the term Eurasian.

The realization that each potential Asiatic people must stand on its own feet if it was to present a front against Europe was the death sentence of such Asiatic international systems as that of the Islamic state and the Ottoman Empire. In the previous century each subject race of the Ottoman Empire in Europe that had had any regional or regimental qualification as a nation had successfully, with or without assistance, seceded as a separate nation; Hungary, Serbia, Greece, Rumania and Bulgaria had been

Europeanized nationalistically. There remained only the Turks in Macedonia and Asia Minor, who until the revolution of 1908 had renounced for themselves any nationalistic reconstruction in the manner of Europe in order to maintain the international imperial institutions of the Islamic state. These institutions consisted chiefly of the caliphate, which insured the solidarity of all Moslems; the Christian communities, which by assuring a modicum of religious and racial autonomy to the minorities might have associated them in the imperial system; and the Capitulations, which even under the Byzantine Empire secured the support of foreign commerce, colonies and capital by more than sufficient extraterritorial establishments. But neither the two-thousand-year old international structure for the common interests of the two continents nor the thirteen-hundred-year old Islamic state for the liberty, equality and fraternity of all Moslems could be maintained against the momentum of nationalistic Europeanization—mined as the Islamic state had already been by the mercantilism and the militarism of imperialistic Europeanization. This soon became evident to the Young Turks through the complete failure of their effort to revitalize the empire with a machinery of central parliamentary party government. This effort to Europeanize an Asiatic empire was defeated by the east European empires which at once foreclosed their mortgages on border provinces—Austria in Bosnia-Herzegovina and Italy in Tripoli—while the new east European nations coalesced in the Balkan War of 1912 in order to partition the Ottoman Empire in Europe among themselves. But for their falling out over the spoils in the second Balkan War, the Turks would have been driven across the straits; as it was they retained only a precarious hold in Thrace.

The Ottoman Empire went down in the crash of the Great War along with the Austrian, Russian and German empires. The British, French and Italians, after efforts to create a joint imperial control of western Asia and a restored Greek Empire, finally evacuated Constantinople and Asia Minor and allowed long delayed developments to take their course. Nationalism swept through Asia Minor eastward, breaking up the Islamic state. There ensued a radical revolution of the institutions, ideals and intimate habits of the inhabitants of Asia Minor, compared to which the French Revolution was merely a change of rulers and the Russian revolution only a change of regime. At the same time

the transference of populations set in motion by wars of extermination and sanctioned by the Treaty of Lausanne converted at untold cost this western corner of the Asiatic continent from a hotchpotch of races and religions into a homogeneous Turkish homeland. The Kurds, the only remaining minority, were repressed after more than one uprising; and there emerged within ten years a new Turkish nation as completely Europeanized in its conditions of life as its neighbors the Bulgars. Superficially Europe had annexed Asia Minor, but substantially Asia had driven Europe from Asia Minor with its own weapons.

In the meantime nationalist Europeanization had swept eastward into Persia and Afghanistan, where it has had much the same effect, although in the latter and to a less extent in the former there have been more or less successful reactions that have mitigated its severity. In Turkey under Mustafa Kemal Europeanization proceeds under a pressure that outpaces even Peter the Great's Europeanization of Russia; Persia under King Riza Pahlavi has a more moderate momentum; while in Afghanistan the revolution has been suspended by the failure in 1929 of the revolutionary and pro-Russian king Amanullah and his replacement by a pro-British reformer, King Nadir. After the failure of the Afghan invasion in 1919 the nationalist movement in India forced to a livelier functioning the antiquated machinery by which the British are slowly elaborating autonomous federal institutions for their immense dependency. To the north the new Soviet government granted autonomy to its subject races. In China a general movement of nationalism almost swept that quarter of the world into a Europeanized unification.

The forces making for the Europeanization of the East have been separated into two conflicting camps. One is the old imperialistic camp, in which the American, British and other mercantile maritime powers continue their efforts to educate Asiatic peoples in their individualistic philosophies and their industrial systems, to exploit them in the interest of their capital, commerce and colonies and to extend to native nationalists or socialists only such self-determination as the imperialists may determine. The other camp is that controlled by the Russians, who endeavor to educate the peoples of Asia in the philosophy of communism and to emancipate them from all other domination, in the confidence that conformity with the creed and constitutions of communism will be sufficient in

itself to secure their solidarity with a Soviet world system. As a result of their bold experiments and bitter experiences with their own soviets the Russians are convinced that not only in industrial but also, although to a lesser extent, in agricultural communities the main movements for progress are today nationalism and socialism and that the latter can be made the stronger of the two. In other words, they hold that Europeanization through nationalism can be supported and eventually supplanted by socialism. Europeanization is now therefore proceeding from two different polities by two conflicting policies, with a fighting front between them drawn across Asia from west to east. The course of post-war history in Asia and of the Europeanization which has transformed the east to a changeling of Europe is found in the fluctuations of these two fronts. The first successes of the Communists were secured by their complete concessions to nationalist aspirations in the buffer states of Turkey, Persia and Afghanistan and in China. Their subsequent setbacks were due to their overconfidence in the socialist factor, which led them to press the pace unduly, resulting in the secession from their system of Turkey and Persia and in the separation from it of Afghanistan and China by the capitalists. But besides this vertical geographic and national front there is a horizontal and social front. For obviously capitalist Europeanization appeals most to the princes and to the propertied classes, while communist Europeanization appeals most to the proletariat and peasantry. But for these divisions the communist Europeanization of Asia would be inevitable. If communist philosophies and policies did not mean the end of all propertied classes in power throughout Asia as elsewhere, Asia would by now have been Europeanized according to the Russian model. Just as the imperialist Europeanization of mandated territories like Irak or Syria must be distinguished from the nationalistic Europeanization of Japan or Turkey, so Asiatic Europeanizations based on nationalism, as in Japan, must be distinguished from those based on socialism, as in Mongolia.

The traditional conception of Europeanization as based on the history of the last century must be revised. The epoch of Europeanization in terms of the pressure of European colonial expansion, of capitalist exploitation and of Christian cultural education is rapidly passing. The future Europeanization of Asia will proceed from Asia itself, under pressure of nationalism

and communism, both of which will tend to end its dependence on Europe and possibly eventually to establish its dominance over Europe. Asiatic peoples that can combine these two forces will become thereby not only impervious to but imperious toward European peoples whose nationalism is wasting itself in armaments and whose socialism is wilting in internecine antagonisms. In short, Europeanization in the future will not mean the political or even the economic domination of Asiatic by European nations. The flanking movement by which Asia is encircling Europe to the north, and which counterbalances the flanking movement by which Europe has encircled Asia to the south, may be the first advance of Asia in a new pendulum swing of Asiatic ascendancy.

This analysis of Europeanization explains not only the general alignments of the balance of power in terms of world movements but also some curious anomalies, such as why the most prompt and productive of Europeanizations took place in the most easterly of the Asiatic peoples, the Japanese, and conversely why the latest and least promising has been that of the westernmost peoples, the Moroccans. It also explains why the only place where the old Ottoman society survives is in the heart of Europe, Bosnia, where it has been preserved by European imperialist rivalries; why the liveliest centers of communism are in the citadels of western imperialism, the treaty ports and the East Indies; and why imperialist Europeanization has failed to push over the Eurasian Soviet system in the West although it has pushed it back in the East.

Not only Asiatics but also Africans and, so far as they survive, American natives possess cultures and social constitutions that are more ancient than those of Europe and better adapted to the pursuit of happiness in their communities, especially in the climates and countries concerned. They regard the supersession of these by the simple social systems of Europe much as Europeans regard the subversion of the Roman or the Byzantine by simpler Asiatic societies. The Asiatics have always had little to learn from the Europeans in ethical and religious matters and could teach them much in matters of social morality. It seems probable that the period of direct educational Europeanization passed with the last century and with such successes as the education of the future leaders of the Near East by institutions like Robert College. Education of Asiatics in Europe has lost some of its earlier disadvantages, one of which is said to have led

Midhat Pasha to complain: "Je vous envoie mes jeunes gens pour être civilisés, ils me reviennent syphilités." Asia now educates itself in Europe and for every European who has a knowledge of Asiatic languages, literature or life there are hundreds of Asiatics who have learned not only the strong but the weak points of European civilization and culture. Competition in educational Europeanization has been transferred from Asiatic colleges to European universities. America, Eurasia and Europe, New York, Moscow and Paris, now compete for the responsibility for teaching the young of Asia and Africa how to shoot—and whom to shoot. The Christian missions are making no more progress abroad than before and are enlisting even less support at home, while the propagandists of the communist creed are undoubtedly a most formidable factor making for Eurasian education. As against this there is the individualistic education in competition, capitalism and scientific production provided by the impact of European industrialism on the arts and crafts of the East. So far this education has been mainly destructive, and it has therefore a temporary and tactical advantage over the more constructive and conscious propaganda of communism.

In North America the earliest epoch of Europeanization by extermination so simplified matters that North America is more European than Europe. For it is evolving a type of citizen representative of all the races of Europe and a type of society that realizes the best and the worst of the European individualistic industrial system. This fact and its geographic position make it likely that the American empire will replace the British Empire as the leading exponent of exploitative and educative Europeanization of the East. In this role it has been up to the present retarded by its reluctance to assume responsibilities and by rivalry with Japan, also a protagonist of capitalism and the competitive system in Asia. In its dependencies, notably the Philippines, and in its domestic Negro problem America has so far made all the initial errors committed by the British with inevitably the same results in friction and frustration. Nevertheless in the associated activities of the Americans, British and Japanese lies the only prospect of preventing the Eurasianizing of Asia into a communist confederation.

In South America, however, an entirely different Europeanization is slowly creating a new South American race out of south European and South American peoples and will doubtless

contribute a new culture of art and literature after the present effects of European impacts have been forgotten. There Europeanization is producing new life from seed; elsewhere Europeanization has been effected by grafts that cannot even prolong the life of the old stock.

In Africa Europeanization still works by the extermination of the weak peoples, such as the Hottentots, or of the warlike peoples, such as the Hadendoa. European and American disease, drink and drugs cause even more deadly and direct destruction than the dissolution of tribal tradition and communal custom, which is no less fatal for being philanthropic.

The earliest epoch of Europeanization was one of militarist conquest and mass colonization characterized by the expulsion of the native races. But the regions where this was possible were restricted and lay rather to the west than to the east. With the nineteenth century there came in the East an epoch in which the Europeans resembled concessionaires rather than crusaders. The European presented himself indeed in many friendly guises as mandatory, missionary, merchant and money lender. It was the last of these, the money lender, who was responsible for the most significant political consequences, consequences that produced a Europeanization not of expulsion but of exploitation of peoples, from the Morocco Sultanate in the west to the Chinese Empire in the east. The Europeanizer adopted the money lender's policy of granting loans to the successor of the self-made man for his youthful dissipations and then foreclosing on his estates before he came to years of discretion. For example, a century ago in Turkey Mahmud II, who was half French, and in Egypt Mohammed Ali, an Albanian, broke up the ancient Asiatic system and Europeanized their estates. Their inferior successors, however, squandered not only their accumulations but also the apparently unlimited resources of European credit offered them at usurious rates. The sultans Abdul Mejid and Abdul Aziz in Turkey, the pashas Mohammed Said and Ismail in Egypt, the beys Ahmed and Sadok in Tunis, pawned their realms to Europeans and only too late discovered that British or French controllers and tax collectors were installed. Such control, the modern form of conquest, led in the case of the weaker states to armed occupation, as in Tunis by the French in 1881 and in Egypt by the British in 1882. Such occupation and imperialist Europeanization was delayed in Turkey and Morocco by the able rulers Abdul Hamid II

(1876-1908) and Muley Hassan (1873-94) and was eventually ended in Turkey and Egypt by post-war nationalist risings and the Eurasian eruption. Turkey has altogether freed itself from the political servitudes of the Ottoman debt administration and almost freed itself from its financial service. In other countries, such as Egypt, financial contracts of this kind are still respected, although the political controls based on them have been repudiated. In China the foreign control of the customs revenue for the service of foreign loans is one of the most controversial issues in the emancipation of the Nationalist government.

Another Europeanizing procedure that produced a European imperialist and international control of eastern states has been the independent status acquired by European colonies in the East through judicial, commercial and eventually political capitulations. These exterritorial establishments do not, as is generally assumed, owe their origin to the inadequacies, inequities and improbities of the eastern judicial systems. They antedate in western Asia the fall of the Byzantine Empire, the original Ottoman Capitulations being reproductions of those accorded by the Byzantine Empire to the Genoese and Venetian merchants. Similar exterritorial jurisdictions existed everywhere in Europe itself—as, for example, those accorded in London to the Hanse—and were based on a principle of law more equitable than the strict territorial jurisdictions subsequently established by national sovereignties. They were juridically akin to the special jurisdictions and constitutions enjoyed by the religious and racial minorities. In the period of European dominance over eastern decadence that began with the eighteenth century, however, the powerful colonies of European bankers and traders engaged in cut-throat competition for concessions and controls and, backed by their imperialist governments, rapidly developed these regimes of exemption and exception into a means of controlling all native legislation, litigation, finance and commerce. In a few rare instances, especially in the judicial and financial administrations, this power of intervention was used for progress and reform. But in most cases, even when there was no conservative or coercive intention, the rivalries of the respective powers proved irreconcilable in respect to proposed changes. If the life of the foreign colonies as an example of Europeanized civilized comfort was not without educational effect, their influence was even

greater in inciting eastern peoples so to Europeanize themselves as to escape from a foreign interference that was all the more intolerable to them because it was so intimate. Eurasian Europeanized states such as Japan, Turkey and Persia entirely emancipated themselves from these servitudes but the latter are still maintained in the north African and Central American states and in China. In cases where they have been abolished too abruptly in centers of international commerce, as in Constantinople, both foreign colonies and commerce have suffered severely and Europeanization even of the most unexceptionable type has been prejudiced.

Next to the commerce and capitulations of the foreign colonies there comes, as a Europeanizing factor, their culture and, associated with it, the Christian missions and the colonial administrators. These while superficially in conflict with one another nevertheless cooperate substantially in Europeanization by education, a procedure which, now that executive control and even exploitation are passing, is the most prominent and most promising. Even when executive control and exploitation were at their height, there was always an educative element. The Spanish conquistador in the West Indies or the Portuguese crusader in the East expressed the most moral motives for extermination or enslavement. Later Dutch, British and French Europeanizations in a milder and less mediaeval age and with a less missionary mandate helped to transform Europeanization from enslavement to education, although it is questionable whether their education is not as deadly to the souls of the Asiatic and American races as enslavement was to their bodies. In either case such Europeanization defeated itself by exciting rebellion. Spanish and Portuguese domination was overthrown, in spite of the devoted educational and spiritual missionizing of the Jesuits, by an absorption of the ruling race in a miscegenation that may have a future of its own. The Anglo-Saxon attempt to educate Asia in the principles of a creed which it preached but did not practise and of constitutions which it worshiped but could not work has produced such rebellions as that of the British educated babus in India, who prosecute their Eurasian emancipation of India from the British by preaching the immediate and unmitigated introduction of British industrial civilization and political institutions.

The educational epoch of Europeanization has passed through phases. The role of the Catholic missionaries in the early epoch of con-

quest was reproduced later both by Protestant missions and by political proconsuls like Stratford Canning and Cromer, Henry Lawrence and Charles George ("Chinese") Gordon. With the new imperialism of the end of the last century there appeared a less sincere and more sanctimonious Anglo-Saxon attitude in the "white man's burden" of Kipling, "the yellow peril" of Wilhelm II and the A and B mandates of the Peace Conference. It is this later assumption of a moral supremacy and a mental superiority that has already raised Asia in revolt and that will some day raise Africa. But with the present century prospects of a pacific Eurafican Europeanization of Africa have improved, for the same ideas and interests that have caused twentieth century imperialism to attempt to conserve the existing customs and constitutions of Asia have also caused African administrators to try to revitalize African tribal and communal societies rather than revolutionize them. Such Eurafican experiments as those of the British in Nigeria or the Sudan have so far a vitality and virtue that are wanting in the more revolutionary educative efforts of Americans in Liberia or the more exploitative enterprises of Belgians in the Congo. The Europeanization of central Africa is in any case in its earliest stages.

The Europeanization of north Africa is still in a first phase of conquest which has been prolonged for over a century. The latest and probably the last of these conquests was that of the Riff tribes of Morocco Berbers who rose against, and for years resisted, the whole force of France and Spain. From this there emerges a remarkable difference in the development of Europeanization in northern Africa from that in western Asia. The Berber tribes of north Africa, a virile and versatile stock of European type, whose development has been delayed by Asiatic imperialism and Islamic institutions, have so far been partitioned into Spanish, French and Italian protectorates under military regimes. Since the French finally broke the piratical power of Algiers in 1830 the revolts of the Berber tribes, from that of Abd-el-Kader in the years from 1836 to 1847 to that of Abd-el-Krim nearly a century later, have been crushed. One of the last of the Eurasian Europeanizations will be that of Morocco, Algiers and Tunis by a Berber nationalist movement; and it may in a future century in combination with the Eurasian expansion of the Soviet system provide the southern claw of an encirclement like that which in the early Middle Ages nearly pinched out a

decadent and undeveloped European civilization.

Tripoli and Arabia represent regions, races and regimes wholly recalcitrant to Europeanization whether imperialist, nationalist or socialist. The Arab tribes of the Tripolitan Sahara, as organized under the regime of the Senoussi, have been successfully subdued by French, British and Italian imperialism; while the far more formidable Arabs of the homelands in the Arabian deserts, now all dominated by the Wahabi sect, have never yet been subdued. The deserts of Arabia and the plateau of Tibet are therefore now the only regions of Asia which so far have excluded all Europeanization of every sort and sense. If Asia should ever seek a more satisfying solution of its future than the Eurasian nationalist-socialist systems of Japan or Russia it will find it in the church militant of the Arab or in the church mystical of the Buddhist. But neither Europeanism nor Eurasianism has anything to say to the soul of Asia, although the spiritual schism between them accounts for such developments as the divergence between the Swaraj and the Swadeshi that is delaying the emancipation of India, or between the southern Kuomintang and the northern Kuomintang that has delayed the evolution of China.

The Europeanization of Egypt and Syria can be classed together. The first is proceeding under British, the latter under French, auspices. The peculiarity in both cases is that these peoples have now at least acquired a spirit of nationality almost a century after they achieved or might have achieved the status of nations. Mohammed Ali not only organized Egypt a century ago as a militarist nation that fought both Arabs and Turks on land and sea on equal terms and that would have established an Egyptian empire were it not for foreign intervention, but this Albanian adventurer and acolyte of Jeremy Bentham also organized it as a mercantilist community on a basis of state ownership and state trading. Without infringing Islamic institutions he anticipated most of the collectivist constructions of the Soviet system. These early Eurasian experiments, although they did not survive his successors, are significant of what may at some later date supervene. At present Egypt's nationalistic Europeanization is being delayed not so much by the relics of British occupation as by the autocratic aspirations of the present king and his factional fight with the nationalist organization of the Wafd. The Sudan, which has become diplomatically and administratively involved in the controversy be-

tween the British Empire and the Egyptian nation, really belongs to the Europeanization enterprises of central and southern Africa and should be classed with Nigeria or Uganda. In Syria the far more bitter and bloody struggle of the natives against the French occupation seems to be rapidly consolidating the rival races, religions and the regional autonomies which they wrested from the Turks and have now wrenched from the French into a Syrian nationalist movement of a Eurasian type. But on the other hand the future of Syria is seen by some rather as lying within the range of a purely Asiatic Arab ascendancy.

The possibility of an Arab ascendancy is the *point de mire* of the mandatory policy of the western powers in their Europeanizing enterprises in this region. It is easy to ascribe more conscious constructiveness to imperialist policy than really exists, especially when it is British. But whether British policy in Palestine and Irak be intelligent or merely instinctive, in its aspect and probably in its aspiration it is an effort to Europeanize the sedentary Arabs and through them the tribal Arabs of the desert by giving progress in the north of the peninsula a western orientation and by providing an opening for the infiltration of western ideas and institutions into the south. For this purpose two conductive canals have been constructed, the one the establishment in Palestine of the Jews, who by their Semitic race and monotheistic religion are akin to the Arabs, and the other the erection in the fertile plains of Irak of a state of Syrian and Mesopotamian Arabs receptive of western civilization. If these are protected from the West against conquest by the recalcitrant and reactionary Arabs of the desert, they may in a generation or so develop sufficient population and power to form a self-supporting western culture center for the whole race. This procedure would promise well but for two impediments. One is the race rivalry that has arisen in Palestine between the majority of Arabs, who regard that region as an essential frontage for their homeland, and the minority of Zionist immigrants, who regard it as the "promised land" for their new national home—a situation which has been complicated by the confusion between promises to Jews and Arabs contracted under pressure of war. The other impediment is the schism between the Eurasian Iraki and the Asiatic Wahabi, which is getting worse rather than better. If British protection were withdrawn, this would result in Wahabism Asiaticizing by force the

artificial Europeanization of Irak. In any case the Arabs cannot remain permanently divided between two such conflicting culture centers. There remains the wholly artificial state of Trans-Jordania, whose purpose is rather tactical imperialism than strategic Europeanization, to provide a buffer between the Wahabiist expansion and the Palestine experiment. It can be classed with the tactical theory that Palestine will enable the British to control the north bank of the Suez Canal should they lose the south bank through evacuating Egypt.

Turkey, Persia and Afghanistan, buffeted between Eurasian communism and European capitalism, are affected by western imperialist and industrial Europeanization with the flux and reflux of these two forces. In this rivalry capitalism exploits any racial or religious reaction, such as that of the Ottoman 'Turks in Constantinople or the Kurds in Anatolia or that of tribal and clerical factiousness in Persia and Afghanistan; while communism exploits proletarian or peasant revolution, as in the factories of India or on the farms of China. The result is a sort of Eurasian Europeanization in which western imperialist and industrial penetration acts not as a battering ram but as a brake. It is to the interest of imperialism to maintain Indian princes or Chinese plutocrats or Afghan priests together with the ancient Asiatic system that supports them.

In India the situation would have settled itself as elsewhere in an emancipation and Europeanization on Eurasian lines but for the fact that India is a geographical term for a heterogeneous hotchpotch of humanity at present quite incapable of developing either a general nationalist or socialist momentum in a minority large enough to move the mass. The Nationalists are a small faction of Hindus of European education, whose aspiration to introduce parliamentary government on the English model as the political self-expression of India and at the same time to protect themselves and to police others by British forces while preaching their expulsion is difficult of realization even with the best will on both sides. The British have thereby been put in a position as illogical as that of the babus—namely, of resisting the realization in India of that parliamentary and party democracy which they have always preached as the principle of progress. Here again imperialism has been forced to check Europeanization and to cherish native institutions that are impervious to it. This protection of Indian economic and political systems,

although imposed in the interests of empire, has also been in the interests of India. But the consequent conflict between the British and the ardent believers in British institutions and ideas organized in the Congress party and the fierce factional fighting between Moslem and Hindu nationalists are not as yet ended. It will require much hard work and many soft words to evolve a solution based on local autonomies adapted to each community and adjusted to a central authority. Significantly enough this solution seems likely to be on similar lines to the system set up by the Soviet government in the Caucasus. If and when some conference succeeds in combining the conflicting interests of Hindu and Mohammedan, of Brahmans and Rajputs, of princes and proletarians, of the *pax britannica* and Swaraj, of the ascetic Asiaticism of the Mahatma, the autocratic Eurasianism of the maharajah and the exotic Europeanism of the babus, then India will cease to be an empire and become not a nation, but a federation of nations associated in a Eurasian Europeanization. Its new solidarity may be sufficient to prevent internecine war and its old social sense may be sufficient to protect it against the worst evils of incipient industrialism and competitive capitalism.

In the meantime the present trend is toward revolutionary Europeanization, the Asiatic reaction, such as it is, being represented by the British imperialists and not by the native nationalists. The Mahatma himself has been drawn out of his Asiatic atmosphere into the difficult diplomatic negotiations for the settlement of an Indian federal constitution between the conflicting interests of British and Indians, of Moslems and Hindus and of the native states and India. Success in this Europeanization will inaugurate a period of Eurasian independence and of industrial exploitation in certain centers. Since the new India will have neither the social solidarity nor the political stability of Japan, such a period will probably produce a class conflict within those industrial centers as well as civil conflict between them and the more virile but less developed Indian communities. For Moslems will not readily accept the ascendancy of Hindus nor Indian princes the authority of an Indian parliament. The consequence of this may be either reaction in the restoration of a native empire with an Asiatic appeal and an autocratic authority or revolution within the radius or even possibly under the regime of the Soviet system.

Industrial Europeanization in India is as yet only incipient, 90 percent of the population is still agricultural, and of the seventeen millions in industry only one million are in power factories. Conditions in some industrial centers, such as Bombay, are so bad that already they have created a communist movement, while the general standard of life and status of labor is almost as low as in China. Labor organization is only beginning and the social legislation which is relatively well developed is due not to its pressure, but to British influence. Large scale industry is still foreign owned, although Asiatics such as Parsees and Chinese are tending to displace Europeans. India is rapidly emancipating itself from dependence on European industry; for example, it now supplies one half its consumption of cotton goods. This economic progress has been hastened by political propaganda, the boycott of British manufactures appealing equally to both Europeanist nationalists and Asianist Gandhists.

Intellectual Europeanization in India is still mainly English and confined to the professional classes. Compulsory schooling is limited to a few centers and 92 percent of the population is illiterate, the Moslems being especially backward. Under the system of diarchy education expenditure was left to provincial autonomies and is exiguous. On the other hand, college education is turning out more Europeanized intellectuals than present political and economic conditions are able to employ.

The Europeanization of the four hundred millions of Chinese can be classed with that of the three hundred and twenty millions of Indians as to internal complexity and international complications. The Chinese mass, however, being more homogeneous and more Asiatic, has been also more impervious to Europeanization of every sort. Conquest, except in a more or less foreign fringe, as in Hongkong or Formosa, Mongolia or Manchuria, has been out of the question. Control by foreign capital could not be carried further than the collection of customs on foreign commerce. Control by capitulations and foreign colonies could not be extended outside the treaty ports. Russian railway guards might police a line through the northern provinces, British river gunboats might patrol the central rivers, but China as a whole could not be Europeanized from outside. It could only Europeanize itself as and when it chose, and the early attitude of China toward Europeanization was as antagonistic and anti-European as any-

where. The Boxer rising of 1900, with its massacre of thirty thousand Christians and of some hundreds of Europeans, was the last explosion of this early exclusivism.

Voluntary Europeanization, following the Japanese example, first expressed itself in the Chinese constitutional movement from 1906 to 1909, which resulted in the replacement of the Manchu autocracy by a democratic republic in 1912. In this movement young China was influenced by British and even more by American education and example and was still a European disciple and not yet a Eurasian dissenter. The death of Yuan Shih-kai prevented conversion of this republic into a new native empire and the World War associated China in alliance with its principal Europeanizers—British, Americans, Russians and Japanese. But the reaction that followed their attempts to exploit pacification by further partitions and penetrations of Asia resulted in a revolutionary reorientation of the Chinese Nationalist movement comparable to the revolt of Moroccans, Egyptians, Turks, Persians, Arabs, Afghans, Koreans and Filipinos against this recrudescence of imperialism.

Japan, whose Eurasian nationalism had become definitely imperialist in the period following the Russo-Japanese War, formulated in 1915 the Twenty-One Demands, which would have involved a Japanese control of China and the colonization of a purely Chinese province, Shantung. This plan failed because of Japanese reconsideration, Chinese resistance and the rivalry of other powers. Russia next took the field in 1925 with a much stronger bid in the latest form of educational Europeanization. The campaigns of western Europe against the Russian revolution threw Soviet communism and Chinese nationalism together, as similar interventions had in the case of Turkey, Persia and Afghanistan. Revolutionized Russia having renounced voluntarily its capitulations and other controls and the Central Powers having been forced to do so by the terms of peace, Chinese nationalism was brought into direct collision with the capitulatory treaty port powers, especially the British with their privileged colony at Shanghai and their police control of the Yangtze. The situation then developed as a Chinese nationalist renaissance centering itself in Canton, where Sun Yat-sen had reenforced it with a socialist movement which found a strong response both from a proletariat suffering from the evils of uncontrolled industrialization and from a peasantry enslaved by landowners and exploited by

officials. After the death of Sun Yat-sen this nationalist-socialist Eurasian movement, led by communist propagandists from Moscow, spread rapidly northward seeking contact with the reformist-militarist organization of Feng, the "Christian general," who was supported by Soviet communism across the Soviet Republic of Mongolia. So rapidly did these two movements, representing the very different mentalities and methods of north and south China, overrun the interior of China and meet on the Yangtze at Hankow that a Eurasianizing of China under Soviet auspices that would push Europeanizing imperialism out of China seemed only a matter of months. But two counteractions combined first to check and finally to choke this movement. In the north Manchuria, militarized under Chang Tso-lin, was supported by the Japanese in effective operations on the northern flank of nationalism; while in the south a British reinforcement of the Shanghai garrison, analogous to the military intervention against Soviet Russia, effectively enlisted the property owners of central China against the communists. The result was the establishment of a bourgeois democratic government at Nanking and the secession from the southern nationalist-socialist movement of all its middle class and moderate elements. In the subsequent conflict between this constitutionalist center and the communist south and north, Nanking established its control over Peiping and Canton, but the latter withdrew from the coalition in 1931. That control has never been imposed on the tuchuns, or provincial governors, and is still imperiled by communist movements in the north and south.

During this period the industrial Europeanization of China has been proceeding rapidly. There are already about a thousand modern power factories and several thousands of other factories. Conditions in these are universally almost as bad as can be, although they are best in the Japanese and other foreign owned enterprises. Such social legislation as exists is not enforced. Work is generally on a double shift of twelve hours without a rest day and reaches fourteen hours a day in the Wuhan Steel Works. Women and children are practically unprotected and flogging is still practised. Health and housing conditions are abominable. Consequently the early success of communism is not surprising, nor the later failure of nationalism to combine and control China after losing its socialist support. Certainly communist propagandists could never have revolutionized the social system of

China to the extent they have, had it not already been shaken by capitalism.

Educational Europeanization has so far mainly affected the masses through communist propaganda and only to a very much less extent through Christian preaching. The leaders of the new nation seem, with a few prominent exceptions, to be Euramerican and capitalist in their education, while the lieutenants, drawn from the students and intellectuals, are mainly Eurasian and communist. Native education is embryonic and chaotic. Foreign schools and the commercial press of Shanghai are the main channels of European education, while both northern and southern Communists use their military *cadres* and corps for a very extensive and effective Eurasian education in the principles of Sun Yat-sen and Lenin.

In China the prospect of success in the Asianist movement for reviving and revitalizing the ancient culture and civilization is uncertain. As yet there is no Asian prophet like Gandhi and no popular appeal like Swadeshi. China has its philosophers, some of them known to Europe, but young China goes for its philosophy of life to Bertrand Russell and John Dewey or to Karl Marx and Lenin rather than to Buddha and Confucius. But it is quite possible that after the period of Europeanization from England and America that is now ending and after the period of Eurasianizing from either Japan or Russia that is now beginning there will come a period of Asian renaissance from the monasteries and mysticism of Tibet.

In comparison with the Europeanized evolutions of India and China, which affect almost half the human race, those of intermediate regions like Korea, Siam, Cochin China and the Malayan islands of the Pacific, however interesting in themselves, are of a different order of importance. The Malays have given a communist character to their resistance against imperialist Europeanization by the Dutch. The Pacific populations intermediate between India and China are seeking solutions for a reconciliation of their Asiatic faiths with the forms of scientific civilization. The Burmese are tending to be drawn into association with Calcutta Nationalists against the British, while the Anamese and Tonkinese are being drawn into association with the Canton Communists against the French. The Philippines present to the Americans, on a very small scale and in a very simple scheme, the same fundamental problems of Europeanization as the East Indies have produced for the

British. The Pacific islanders, whether Melanesian savages recalcitrant to all the benefits of European civilization or Polynesian societies only too receptive to its abuses, seem to have no more important future than that with which Europeanization has requited the hostility of Hurons, the hospitality of Hawaiians or the harmlessness of Hottentots. The position of the pacific and progressive Koreans may be more promising. Their attempt to make a Tibet of Korea by massacring Christians as a reaction against European imperialism failed, as did their attempt in 1920 to make an Afghanistan of Korea by rising against the Eurasian imperialism of Japan. Under Japanese rule their country has improved its condition without losing its character, and it is only a question of time before they secure an adequate autonomy in a Eurasian East, whether capitalist or communist.

The lead taken by the Japanese in becoming the earliest example of Eurasian evolution has given these islanders the same political and economic hegemony in eastern Asia that a similar lead gave to the British islanders a century ago in western Europe. Japan has passed rapidly through the first phase of a nationalism expanding into an imperialism of conquest and colonization. In the last decade it has entered into the last phase, an imperialism of education and exploitation. The rapidity of this evolution is partly due to the failure of the Japanese, in this unlike the British, both as colonists of other regions and controllers of other races, although in military conquest, maritime commerce and mechanized civilization the Japanese are now inferior to none. The comparative failure of the Japanese to find an outlet for their surplus population by overflowing, like the Chinese, into all available lands has had the advantage of enabling them to undergo a more effective Eurasian evolution whose capitalist character counterbalances the communist Eurasianism of the Russians. The success of capitalist Europeanization in Japan is more highly developed or at least less hotly disputed than that of the collectivist experiments of its rival. For although European industrialization has not yet thoroughly permeated the core of Japanese society or indeed penetrated far from the coastal center, it has entirely Europeanized the whole surface of its civilization. The increase of power factories from about two thousand in 1896 to over forty-five thousand in 1928, the growth of the urban population to about thirty-five percent and the increase of the population as a whole by more than a half since

1880 have given Japan an international interest which is similar and scarcely second to that of the United Kingdom. And while it is dependent on the new Eurasia for the supply of its materials and the sale of its manufactures it is dependent on Euramerica for the monetary support that is as essential to a competitive capitalist system as munitions are to a campaign.

The ethical growth of Japan has kept pace with the economic. Social legislation has developed considerably since the war under pressure of labor organization and the fears of communism. It is now, broadly speaking, on a level with that of the United States and in some political respects, such as the emergence of a Labor party, is in advance of it. Education is still Euramerican, although the national attitude has become wholly Eurasian. Japan has faith in science and learning and follows them with efficiency, as is evidenced by an extremely high attendance in its schools. In this it has not been hampered by any ancient attachment to native Asiatic culture, for the national traditions, for example, *bushido*, are not characteristically Asiatic and can be adapted easily to a Eurasian or even Euramerican philosophy and procedure of life.

The answer to the question whether Asia will be Eurasianized by evolution under Euramerican auspices or by revolution under Russian authority must be sought in the maintenance of the basis of Japanese Europeanization in its Euramerican evolution. Nor are the prospects of an evolution such as would suit capitalistic civilization improved by a rivalry in the Atlantic between Americans and British that has led the latter to exchange an alliance with Japan for association with the United States or by a rivalry in the Pacific between the Americans and Japanese that has led the latter to rely on agreements with Russia.

EUSEBIUS OF CAESAREA (c. 265-340), church father and historian. Eusebius received most of his training in his native city from the priest Pamphilus and became bishop of Caesarea shortly after 313, the year in which the Edict of Milan granted toleration to the church. Believing that this edict marked the end of an era he conceived the idea of relating the stages through which Christianity had passed during the three centuries leading up to the conciliation. Thus he became the father of ecclesiastical history. Knowing his own limitations he made no effort to compose a harmonious and eloquent work like that of a Thucydides or a Tacitus. For him *ιστορία* consisted merely in the diligent selection and convenient classification of the relevant documents. His *Ecclesiastical History* (311, last ed. 324) is little more than an anthology of the texts which he gleaned from the

two rich Christian libraries at his disposal, those of Caesarea and Aelia. But as such, in spite of his misconceptions and his apologetic bias, it has rendered an immense service to later historians of Christianity, a service to which Bishop Lightfoot was the first to give full recognition. For sociologists also, the *History* is replete with information concerning the spirit and organization of early Christianity, the part played by women and the psychology of persecutions. Among Eusebius' other historical works is the *Chronicle* (303), a compendium of universal history which as translated, revised and continued by Saint Jerome became a fundamental guide for mediaeval scholars and remains an indispensable source for modern historians of antiquity.

PIERRE DE LABRIOLLE

Works: Eusebius' works have been collected in J. P. Migne's *Patrologia graeca*, vols. xix-xxiv (Paris 1857), and are now being published in *Die griechischen christlichen Schriftsteller der ersten drei Jahrhunderte*, ed. by the Preussische Akademie der Wissenschaften, vols. i-vii² (Leipsic 1902-26). An edition of Jerome's version of the *Chronicle* was published by J. K. Fotheringham (London 1923). An excellent English translation of the *Ecclesiastical History* by A. C. McGiffert appears in *A Select Library of Nicene and Post-Nicene Fathers of the Christian Church*, 2nd ser., ed. by P. Schaff and H. Wace, vol. i (New York 1890) p. 1-403.

EVANS, GEORGE HENRY (1805-56), American labor journalist and agrarian reformer. Evans came to the United States from England in 1820 and shortly thereafter was apprenticed to a printer. Together with his brother, Frederick William, he avidly studied the writings of Thomas Paine and other radicals and freethinkers. His brother later became a leader of the Shaker sect; but Evans, who was a man of action by temperament, turned instead to the labor movement. In the *Workingman's Advocate*, the

first important American labor journal, which he edited and published in New York from 1829 to 1837, he set forth as the solution of the labor problem the program of the agrarian movement for the equal division of all property, including land and capital. When the depression of 1837 practically wiped out the labor movement, Evans retired to a farm in New Jersey, taking his printing press with him; there he wrote the "History of the Origin and Progress of the Workingman's Party in New York," which was published in the *Radical* in 1842-43 and formulated anew his agrarian philosophy. When he returned to New York in 1844 he resumed publication of the *Workingman's Advocate*, in which he now preached a "new agrarianism." He still expounded the Paine-Jefferson theory of natural rights to the soil and the equal division of all land, but since he now considered capital a product of labor rather than a gift of nature he no longer believed in its equal division. Appreciating the difficulties of securing an equal distribution of land in the settled states Evans demonstrated his practical bent by concentrating on the public domain, advocating freedom of public lands, homestead exemption and land limitation and by thus laying the foundation for the homestead movement. He foresaw the nation wide effects of such a movement: the price of land would fall throughout the country; in order to hold their population the settled states would limit land ownership, until in the final analysis land values would be based entirely upon improvements; since wage earners would thus be given the possibility of taking up free land, the bargaining position of those who chose to remain in the cities would be considerably strengthened; and thus a remedy for inequality of ownership, the "new agrarianism," would replace all "isms" including trade unionism and strikes.

EVIDENCE

GENERAL ASPECTS. Evidence in the legal sense consists principally of oral testimony of witnesses, written documents and various other objects ("real evidence," such as the fatal revolver in a murder trial) perceptible by the senses.

Proof is the process of adducing evidence before a judicial body. The purpose of proof is to aid the tribunal in finding the facts, i.e. conclusions as to the truth of any disputed matters other than disputes about the content and application of legal doctrine, which are questions of law.

Every field of investigation has its problems of verifying the data or evidence upon which conclusions are to be based. Why is it that in the field of law the relatively simple and almost intuitive techniques of valuing evidence which obtain in the other sciences do not suffice? The scientific investigator may find his evidence when and where he may; he may reach his conclusions immediately or after years of calm and maturing reflection; and he is usually a practised expert and himself the judge of the decision to be reached. In the law all this is changed. The trial ordinarily takes place long after the events investigated, and oral reports by witnesses rather than direct observation by the tribunal must usually suffice. The place of trial, moreover, is fixed, and it is a restricted court room where elaborate experimentation with scientific apparatus is impracticable. The atmosphere too is charged with emotion which comes from partisan contest and the contending parties have strong motives to falsify and deceive, motives usually absent in scientific inquiry. Again, the decision must be reached immediately at the close of the case. Finally and most important, the consideration of the evidence in court often devolves not upon one or more experts in trying cases, but upon a group of twelve ordinary citizens assembled temporarily and selected at haphazard.

It is difficult today to conceive of settling judicial disputes through any other method than by informing the tribunal as to the facts and thus appealing to the human reason of the court. In truth, however, this point of view was reached only at a very late stage in the cultural progress of a people. The primitive conception was quite different and doubtless much better adapted to the conditions of precivilized life. That conception was that the appeal must be not to human reason, but to divine judgment. The trial was not a search for facts from witnesses or otherwise through the use of reason, but a mechanical test. Formal ceremonials invoking God's decision were the early methods of trial. Such were the ordeals of fire and water, the wager of battle and the wager of law, or compurgation. This last process did indeed involve "witnesses," but they were not sworn to tell the truth about the

facts in controversy; they were simply formal sponsors who swore that the defendant's oath was clean.

By the time that Caesar's legions stepped upon the shores of Britain to find the Germanic tribesmen settling their disputes by the ordeal, the courts of Rome were deciding cases chiefly upon facts and reason. But in the twilight of Roman culture the principle of rational proof became gradually obscured although never entirely lost. Formalism reassumed through two devices the importance it had had in primitive Rome. One was the "decisory oath" (similar to the oath of the defendant in the Saxon's "wager of law"), by which a case might be staked upon the willingness of one of the parties to take an oath about the dispute in a form prescribed by the court. The other was the rule that one witness was not enough; two credible witnesses were necessary to constitute "full proof." This last rule came in with Constantine; perhaps derived from Scripture, it was taken over by the church into its Romano-canonical procedure as the plinth of its science of proof. The civilians and canonists elaborated a curious system: one good witness was "half" proof. Common rumor and documentary evidence were other species of half proofs. A doubtful witness was worth less than half. Under these scholastic rules the evidence of witnesses had to be added up to make "full" proof. It was vainly sought by these advance generalizations about the value of types of evidence to reduce the judge to a mere accountant.

From the Norman Conquest to the French Revolution the continental system of procedure preserved little of its enlightened inheritance from classic Rome and under churchly influence became more and more sterile and academic. The canon law with its requirement of strict proof was the pattern upon which much of the continental criminal procedure was molded. Older Germanic systems both in church and state had broken down because they depended upon private accusers and hence lacked the impetus of official prosecution and because the accused might exculpate himself by ordeal or oath. But by the thirteenth century a "process of inquisition" had been developed by the church, later to be borrowed by secular courts, by which the accused could be required to answer the questions of the judge and by which the testimony of other witnesses could be taken, secret and apart. The church borrowed from Rome and gave to the new Germanic states the practise of enforcing confession by torture. The stricter the

legal requirement of "full" proof, the more essential was resort to torture to extract it. This mode of prosecution was cruel but effective, but in eras of recurrent civil disorder it was reconciled to a harshness which bore most frequently and severely upon the robber and the brigand. Indeed, the inquisitional theory is the basis of continental criminal procedure today.

In English courts two centuries after the Norman Conquest the ancient rites of the Teutonic forest tribes were still in use. In 1215, however, the church forbade the clergy to participate in the religious ceremonies attendant upon the ordeal and thus in effect abolished them. In the meantime the "inquest" inherited by the Norman kings from the Carolingian empire, a practise of appointing local fact-finding committees to investigate and report on local disputes as to taxes and dues, gave rise first to the "grand" or accusing jury and then the jury of trial in both civil and criminal cases. Although juries for a long time decided cases in the main on individual knowledge and the report of the neighborhood as gathered by them out of court, the stage was at least set for the elaboration of the law of evidence. Even before the appearance of the jury the judges had dealt with documents, and they continued to control the effect that should be given them when juries came in. The witnesses who attested the documents were also required to be produced in court. But before the fifteenth century the use of oral evidence of witnesses was rare. Counsel for the parties pleaded their cases, not in writing as now, but orally; and these pleadings included the counsel's repetition of the statements of those who knew the facts. The judges, however, strictly controlled these statements of counsel and ruled on their sufficiency. But by the sixteenth century England was less primitively rural, the jurors could not be relied upon to know all about neighborhood disputes and witnesses were increasingly brought in. In 1562-63 Parliament for the first time permitted compulsory process to require the attendance of witnesses in common law courts. Conceivably, this innovation might have taken the course that it has in the case of the prosecuting or "grand" jury, which continues to this day to hear witnesses in secret with no judge present to exercise control over what testimony the jurors shall hear. So it was at first with the trial or "petty" jury, and if this practise had continued there would have been no law of evidence. When the custom arose of hearing the witnesses in open court, the judge, accustomed to regulat-

ing the effect of documentary evidence and to controlling the oral pleadings of counsel, which often so nearly resembled statements of the witnesses, easily formed the habit of controlling what the witnesses should be allowed to tell the jury. It is this practise of control by the expert, professional judge, governed by precedent, over what shall be heard and seen by the jury, the group of laymen unskilled in trying disputes, that constitutes the subject matter of the Anglo-American law of evidence. The groundwork of the modern system was laid in the two centuries from 1500 to 1700 and consequently it may be said that the common law of evidence is of comparatively recent growth.

Rules of evidence in Anglo-American law are not a science of weighing proof; they are chiefly regulations governing the admissibility of proof. In other words, the problem is: what shall the judge, in view of the limitations of time and space which a judicial trial imposes and in view of the limited educational and intellectual equipment of the jurors and their liability to prejudices and emotion, permit the jurors to hear at all? It is safe to say that without the jury there would be no law of evidence remotely resembling the rules of admissibility which make up its content in English speaking countries today.

In attempting to summarize the principles of the law of evidence as finally developed at common law, it is well to notice that a system of written pleadings, filed before the trial, has also developed in modern times and has superseded the more flexible practise of oral pleading. The scope of allowable evidence is sharply limited to the issues made by these written pleadings. It should also be noted that some contentions do not have to be established by evidence. Under the principle of judicial notice the judge may dispense with evidence of a fact which it would be useless to debate before the jury, either because it is universally known, as that ice is lighter than water; or because it was susceptible of ready ascertainment by the judge beyond possibility of reasonable dispute, as in determining whether a certain date fell on Sunday; or because it is within the purview of the judge's range of official information. Thus the judge officially knows without proof the terms of the laws of the state, although not of foreign states. Again, proof is dispensed with, obviously, when the adversary formally admits the fact in his pleadings or at the trial.

Most evidence comes to a court through the mouths of witnesses, and the common law mi-

nutely regulated their competency. Witnesses were classed as either to be accepted or to be rejected altogether, according as they fell in one strict category or another. First, the witness had to have mental and sensory capacity to observe the facts to be related, to remember them and to narrate them. In the seventeenth century there was a tendency to bar insane persons and children under seven, as such, but the more general standard came to be accepted in the next century and obtains today. Second, where the witness was called to testify to matter susceptible of being perceived by the senses, the witness must have had first hand knowledge of the facts. Third, belief by the witness in a God who here or hereafter would punish falsehood was conceived to be essential, as a corollary to the requirement that an oath should be administered. Fourth, parties to an action civil or criminal were disqualified as well as their husbands or wives; a mechanical extension of this rule was its converse that a party could not call his adversary, a rule mitigated, however, by the fact that suitors could resort to the Chancery, where the judges with their inheritance of canon and civil law doctrines regularly permitted a party to examine his adversary. Those who, although not parties, had a direct pecuniary interest in the result of the trial were also disqualified. Fifth, those who had been convicted of a serious crime were considered "infamous" and as such debarred from testifying as witnesses.

The last three common law categories of the disqualification of witnesses were almost completely swept away by legislation after the middle of the nineteenth century inspired by the criticisms of such reformers as Bentham, Brougham and Denman in England and Field and Livingston in America. The requirement of a religious belief in divine sanctions was in England, Canada and all but a few American states changed to permit those who have religious scruples against swearing or no religious belief to testify upon bare affirmation. Many American states likewise forbid any inquiry into the religious belief of the witness upon cross examination in order to prevent the arousing of prejudice.

The disqualification of parties who are generally those who know most about the facts in dispute seems perverse today. It was a late excrescence, of which the first trace is to be found in the time of Elizabeth. It seems to be explained by the contrast which existed between the early proceedings where the oath was a decisive ceremonial, as in wager of law, in which the party's

oath was an essential and characteristic step, and the later trial by jury, where it was the jury's oath that was considered to be the conclusive act of the trial. In the seventeenth century, when the tradition that the jurors decided on their own knowledge and that oral evidence was merely incidental was still lingering, the notion of an oath taken by a party "with no flavor of decisiveness" such as it had in wager of law seemed unnatural. The exclusion of parties was rationalized as being based on the motive of self-interest, which was considered to render a party unreliable as a witness; the same reason justified the disqualification of those pecuniarily interested in a case, but a piece of scholastic logic based on the Scriptural fiction that husbands and wives are "one flesh" was necessary to explain the exclusion of husbands and wives of parties. Unlike the canon law the common law attached no disability to other relatives of parties. These rules bore with especial harshness upon the accused in a criminal case. Although permitted to make an unsworn statement he was denied the privilege of testifying himself and could call no other witnesses at all until 1695; he was denied the right to be represented by counsel until 1836. Even in the United States persons accused of crime did not acquire the right to testify in their own behalf or to call their husbands or wives as witnesses until the latter half of the nineteenth century. Not until 1898 did England accept this last reform, and in Georgia even today the accused may only make an unsworn statement to the jury. Vestiges of the rule of disqualification for infamy still exist. A conviction of crime may still be shown to cast doubt upon the credibility of a witness. While the federal courts in the United States have abandoned the disqualification for infamy in criminal cases, they still retain the rule which denies a person accused of crime the privilege of calling wife or husband as a witness for the defense.

Closely related to these rules of competence is the privilege of avoiding self-incrimination. In criminal cases the accused down to the seventeenth century was grilled and questioned by the judges as a matter of regular routine. When, however, the political conflicts of that century between crown and parliament brought to issue the practises of the Star Chamber and the ecclesiastical courts, where the inquisitory procedure assumed supreme importance in the absence of a jury, the forced self-incrimination customary in those courts became associated

with royal tyranny in the minds of the prevailing popular party. A canon law maxim (*nemo tenetur prodere seipsum*) was seized upon to condemn the practise out of the mouths of the canonists; and when in 1640 the Star Chamber was abolished, the practise of examining the accused was likewise forbidden in the ecclesiastical courts and the common law courts of the commonwealth began to recognize the existence of a privilege of one accused to refuse to answer questions. By the logic of that day the spouse of the accused was likewise held immune from compulsion to testify for the crown. The present privilege against self-incrimination allows a witness to decline to answer any question exposing him to the danger of criminal prosecution. In legal theory at least a person accused of crime may remain silent in the face of all questions from the time of his arrest through the completion of his trial. It is true that the privilege against self-incrimination is not so absolute as it seems. Juries do in fact tend to make all possible assumptions of guilt against those who fail to tell their story, and a realization of this usually impels an innocent man to take the stand. The strongest consideration in support of the privilege is that it stimulates the police and prosecuting officers to make a more thoroughgoing investigation of the facts than they would if they could rely on getting the proof by grilling the prisoner. In England, where the police are carefully selected and trained, it is probable that the privilege does have this beneficial effect; but there is reason to believe that in the United States it tends to cause our relatively inefficient officers to resort to extralegal methods of extorting confessions by force. On the whole, it seems that under careful safeguards the privilege might well be abolished, but it is still firmly entrenched in federal and state constitutions. Alongside the privilege of the accused still stands the privilege of the husband or wife of the accused not to be called by the prosecution. Justified upon the supposed social policy of preserving marital harmony, it still obtains in practically all common law jurisdictions.

The only relics which remain of the disqualification of interested parties in civil cases are the so-called Dead Man's Statutes adopted in most American states. By their terms, when one of the participants in a contract or other transaction has died and a lawsuit arises between the survivor and the estate of the deceased, the surviving party may not testify about any transaction or communication which he has had with the de-

ceased. It would seem, however, that the statute is relatively ineffectual to shield the dead man's estate from fraud, since only the claimant himself is barred as a witness, and one who is willing to fabricate a claim would be willing to suborn third persons to swear to the alleged facts. The object of the statutes could better be secured by permitting the survivor to testify but at the same time admitting statements made by the deceased to third persons about the transaction, which would normally be banned as hearsay.

A further important ground of privilege is that of confidential communications, such as those between husband and wife or lawyer and client. Originally the privilege in the latter case was that of the lawyer on the theory that his professional honor would be violated by the disclosure, but it came to be recognized as being that of the client, which means that the latter may waive it while the lawyer cannot. Important officials also are privileged to withhold secrets of state. Similarly, prosecuting officials may not be required to disclose the identity of informers. The common law thus permitted a witness to refuse to divulge a confidence only where for special reasons the maintenance of secrecy seemed extraordinarily important; no general privilege for family, friendly or professional confidences was conceded. Under pressure from professional groups, however, a substantial number of states have by statute extended the privilege to professional confidences communicated to physicians and to confessions made to priests and ministers. Probably a similar privilege should be accorded to secret confessions made to judges and especially by children to judges and officers of juvenile courts; in the latter courts the privilege has been recognized by statute in Connecticut.

Apart from the rules as to the competency and privileges of witnesses the common law developed a number of drastic rules of exclusion, of which the chief in importance is the hearsay rule. It was said by Wigmore that this rule, next to jury trial, is England's greatest contribution to the world's jurisprudence of procedure. The rule is closely allied historically and practically to the requirement mentioned above that a witness must be qualified by first hand knowledge of the facts he relates, a requirement imposed from early times upon attesting witnesses. The rule directed specifically against hearsay first emerged in the common law as late as the second decade after the Restoration. It did not forbid all evidence of

previous out of court statements and writings. Otherwise it would be impossible to prove written or oral transactions which constitute the everyday subject matter of legal disputes, such as contracts, frauds and slanders. Only where some person's out of court statement of fact was offered to show that the fact was as stated because that person said so, was the evidence hearsay. The rule amounted to this, that common law courts were unwilling to admit in evidence an assertion which the party against whom it was offered had had no opportunity to test by cross examination. During the eighteenth and nineteenth centuries, however, numerous exceptions to the hearsay rule were gradually accorded recognition: evidence given at a former trial is admitted if offered against a party who had an opportunity to cross examine in the former suit on the same issue; a dying declaration relating to the immediate circumstances of a homicide (such as a declaration identifying the murderer), made when hope of life has fled, is admissible but only where the declarant's death is the subject of a criminal charge; statements against interest are allowed when the interest affected is not an emotional but a material one; declarations by a member of a family about matters of pedigree or other facts of family history are permitted; mercantile book entries and entries made in the regular course of any business are admissible. In each of the five foregoing classes of cases the hearsay statement will not be admitted unless it is shown that the person who made it cannot now be produced as a witness, because of death, physical or mental infirmity or absence from the jurisdiction. This has caused difficulty in the case of book entries, which are often a composite product. It sometimes becomes more economical to abandon the collection of a debt than to meet the requirement of producing all the employees necessary as witnesses because they have participated in making the entry. A mere showing that the books are regularly kept in the course of a business should suffice to secure their admission as evidence, which the adversary could contradict or explain.

The following classes of statements are admitted under other exceptions to the hearsay rule without any requirement that the person who made one be unavailable as a witness: (1) Admissions and confessions. A party could hardly be heard to object that his own statement ought not to be received because he did not have an opportunity to cross examine himself. Similarly statements are admitted when made by the

party's agents in the course of the agency, or by persons under whom the party is claiming his rights asserted in the suit, such as statements made by an ancestor offered against the heir. The term confession designates an admission of the crime by the defendant in a criminal prosecution. Confessions are surrounded by special safeguards and the courts are sedulous to exclude them when the proof shows that they have been extorted by fear or inducements of reward, such as promise of a lighter penalty. This judicial vigilance, however, cannot always forestall "third degree" methods by the police, since an extorted confession may often yield fruit in a plea of guilty. (2) Official registers and reports, e.g. birth certificates, legislative journals and certificates of registration of deeds. (3) Evidence of reputation, which is common hearsay circulated in the community but is distinguished from isolated rumors, may be received as evidence of the character of a person where such evidence is at all allowed. Reputation may also come in to prove ancient matters of general interest, such as the boundaries of counties, townships and (in the United States) of private estates. (4) Declarations made as to one's physical condition at the time of utterance, e.g. "I have a terrific headache," but not "I had a headache yesterday." (5) By analogy to the last, declarations as to one's present mental state, such as declarations of intention ("I shall make my home here") or motive ("I am leaving because I wish to work for someone else") or emotion (wife's declaration of affection for defendant in alienation case). (6) Spontaneous exclamations made under stress of excitement produced by some startling event, as where an automobile driver after an accident exclaims, "My brakes wouldn't work," a type of evidence frequently important not only in collision cases but in crimes of violence. In view of the well known distorting effect of excitement the psychological soundness of the legal theory that excited statements are especially reliable is open to question.

Wigmore finds these common elements in all the exceptions to the hearsay rule: the classes of hearsay statements admitted are those which are supported by such a circumstantial guaranty of special reliability as to furnish a substitute for the safeguard of cross examination, or those for whose admission a special need appears, either because the author of the statement is now unavailable as a witness or because his statement was probably more reliable than his present testimony would be. These exceptions to the hearsay

rule almost swallow it up. It must be difficult for a judge to administer them accurately by snap judgment in the heat of trial. It may be that the next stage in the evolution of the hearsay rule will be the emergence of a general rule based on Wigmore's generalization, e.g. that hearsay shall be admitted only when it seems needful to the trial judge for the elucidation of the facts and seems to have been made under circumstances which give it reasonable assurance of trustworthiness. A step in this direction is the Massachusetts statute of 1921 which admits all statements of persons since deceased, where made in good faith before suit and on personal knowledge.

An offspring of the rule requiring that a witness speak from first hand knowledge is the "opinion" rule, which excludes evidence of conjecture or inference as distinguished from concrete description of objects, situations or events. Where objective description is difficult, however, inference or opinion is allowable. Thus a witness ordinarily gathers only a general impression; for example, that a horse is wild or a man is drunk. Obviously every verbal description, however concrete, has in it a large measure of inference beyond the mere statement of primary sense impressions, and the difference between fact and opinion is one of degree. Many American courts, however, are prone to attach a false importance to this distinction and to reverse cases when the trial judge has admitted the opinion of a witness, especially when the opinion relates to some ultimate issue in the case. They fear that they may open the door to the overbearing of the jury's judgment by the expressions of influential citizens on the merits—a fear which seems exaggerated. A second qualification of the rule against opinions is the doctrine that expert witnesses, who have such training and experience as qualifies them to do so, may give in evidence their inferences and conclusions as to matters in their special fields.

Some peculiar rules as to proof of character should be noted. First, there are the rules as to the method of proving it. It has already been observed that the normal way under the Anglo-American system is by proof of reputation in the community. The more vivid method of showing specific instances of good or bad conduct is banned because of its liability to involve the trial in side issues and thus waste time and confuse the jury. Likewise evidence of a witness' opinion of the man's character based on personal observation is usually forbidden, although there seems

little reason for such prohibition. Second, there are rules as to when character is open to proof at all. Character evidence is always proper where a person's character is directly in issue. More often proof of character is sought to be used as the basis for an inference that the person on a given occasion has acted in keeping with such character, but such evidence is allowable only in a few situations and with limitations. In any case the credibility of a witness may be attacked by evidence of his want of veracity in the form of previous conviction of crime. In criminal cases the accused may give evidence of his good character in order to raise the inference that he did not commit the offense. It is only when the accused opens the door to evidence as to his character, either by calling witnesses or by voluntarily going on the stand himself, that the prosecution may offer evidence of his bad character. Such evidence may be so damaging to him in the eyes of the jury that it is conceivable that a defendant who is innocent but who has a criminal record might prefer not to take the stand and explain his innocence. The English Criminal Evidence Act of 1898 probably follows sound policy in protecting the accused who takes the stand from having his criminal record revealed, except where he has given evidence of his own good character or has attacked the character of the witnesses against him and with certain other exceptions. In general, it may be added that, while the courts hold within strict limitations evidence of character to show conduct, evidence of specific habits to show probable conduct in accordance with the habits is freely received—a distinction which seems in accord with psychological findings.

With respect to documents there are some special rules. In the first place, documents are not received in court until their signatures have been proved. Another salutary rule, the best evidence rule, requires that if evidence is to be offered of the contents of a document the original writing must be produced. A copy or oral evidence may be received, however, if it is shown that the original has been lost or is in the hands of the adversary who on notice has failed to produce it in court, or that for some other reason it cannot be procured. Under recent cases, carbon copies are sensibly treated as duplicate originals. Another rule about documents which is productive of much conflict and confusion in the cases is the parole evidence rule, which prevents the varying of the terms of written agreements when they appear to have been intended

to supersede any preliminary oral agreements. The parole evidence rule is regarded by Thayer and Wigmore as a rule of substantive law rather than as a rule of evidence. It has a distinctive procedural cast, however, in that it requires the special intervention of the judge to protect rights claimed under writings against the danger of improvident findings by juries.

The responsibilities of the trial judge for the enforcement of evidential rules and standards are heavy and unremitting. The law offers no all embracing formula for determining whether a given item of proof is relevant to the issue, and logic and experience must be the only guides. Even when evidence is logically probative, the trial judge must still exclude it if he finds that its probative value is slight and is overborne by the danger that it may arouse undue prejudice in the jury, may confuse the issue or lead to undue consumption of time. This is a vague standard and the trial judge's decision in applying it will seldom be disturbed on appeal. Again, the trial judge in requests to dismiss or to direct a verdict, at various stages of the trial, must constantly face questions of the sufficiency of the proof offered by the parties to support their respective contentions in accordance with the rules relating to the "burden of proceeding." The burden of proof rests upon the party who asserts a contention; the party must proffer such evidence as will lead to ultimate persuasion of the jury, while the burden of proceeding merely requires a party to carry the evidence to a point where reasonable men might be persuaded that his contention is true. While the burden of proof is constant, the burden of proceeding continually shifts. In civil cases the formula used by the judge in speaking of the burden of proof is that the party pleading a fact must prove it by the "preponderance" or "greater weight" of evidence. This is but a metaphorical statement that he must satisfy the jury. In criminal cases the state must prove its case "beyond a reasonable doubt," which is thought to require a greater degree of intensity of conviction on the part of the jury. Appellate courts have been inclined to attach much importance to exact correctness in the trial judge's instructions on burden of proof, but it is questionable whether the jurors ordinarily give any attention at all to them.

Oft recurring states of fact have been the occasion of frequent rulings by judges as to their sufficiency to form a basis of inference. These habitual rulings, based sometimes on notions of probability, sometimes on social policy, are con-

stantly becoming crystallized into established rules; and where they do they are called presumptions. Thus the presumptions have become established that a child born to a married woman during wedlock is legitimate and that a person who has disappeared for seven years without being heard from is dead. Legislatures are constantly adding to the list of presumptions; for instance, the presumption in most prohibition acts that one who is in possession of liquor holds it for sale or some other unlawful purpose. Presumptions may be permissive, i.e. merely requiring a ruling that the proof is adequate for the jury to find in favor of the inference if no contrary proof is offered; or mandatory, i.e. requiring that the jury must so find in the absence of counter proof.

In the traditional English practise which is preserved throughout the British Empire the trial judge has the power to comment on the credibility of the witnesses and the weight of evidence. In other words, while the jury can disregard the judge's opinion and decide the facts as they see them, he may nevertheless give the jury his inferences from the evidence. When it is remembered that the judge and the counsel on each side are the only men in court who are professional experts in weighing evidence and that of these the judge is the only one who has the official duty to maintain an impartial attitude, it is remarkable that it should ever have been suggested anywhere that the judge by statutory muzzle should be prevented from giving his opinion on the facts to the jury, while the lawyers retain in fullest luxuriance their power to express theirs in argument. This topsy turvy regulation has nevertheless been established in nearly all the American states, although not in the federal courts. The first statute, that of North Carolina in 1796, was a reflection of the patriots' hatred of royal judges; but the curtailment of judicial power, like the change from appointment to popular election of judges, was in accord with the frontier ideals of Jacksonian democracy, and it spread rapidly in the newer states. In diminishing the control of the judge the position of the advocates was magnified, a fact which explains why the legislatures with their many lawyer members supported the change.

So casual and haphazard are the acts of Congress on the subject and so few and scattered the decisions that it is difficult to give a general answer to the question of how far the federal courts are governed by distinctive federal rules

in matters of evidence and how far they are governed by the local rules in the states where they sit. As to competency of witnesses, local rules govern in civil cases, but in criminal cases they do not. As to questions of admissibility of evidence, seemingly in actions at law the local state rules govern; but in equity and admiralty federal decisional rules, uniform throughout the country, will be followed. A desirable simplicity would be promoted if Congress would either make the local state rules of competency of witnesses and admissibility of evidence applicable in all classes of cases in the federal courts or, preferably, would empower the Supreme Court to formulate uniform nation wide rules of court procedure, regulating witnesses and evidence as well as all other matters of procedure in the federal courts.

The Anglo-American law of evidence is, as Thayer called it, "a piece of illogical, but by no means irrational, patchwork; not at all to be admired, nor easily to be found intelligible, except as a product of the jury system" (*A Preliminary Treatise on Evidence*, p. 509). These rules, when applied to a tribunal where a highly trained officer must regulate what shall be heard by a large untrained group delegated to find the facts, have a large measure of practical wisdom. As cautionary guideposts they are valuable to any investigator of facts who has judgment enough to know when to disregard them. As rules they are absurdly inappropriate to any tribunal or proceeding where there is no jury. It is somewhat surprising to find that in the courts of Chancery, where the judge has always determined the facts without a jury, and also in courts of law in cases where a jury is waived the judges profess to be bound by the jury trial rules of evidence. In fact, these rules are administered very loosely under such circumstances; and if the trial judge admits incompetent evidence, the upper court will assume that he disregarded it if there was other competent evidence upon which he might have based his judgment. Fortunately, administrative tribunals have generally not been fettered by the ordinary rules of evidence.

How, if at all, can the Anglo-American system of evidence be better adjusted to social needs? Wigmore's masterly discussion of the shortcomings and future of the rules gives a wise and comprehensive ground plan of needed reforms drawn in the light of his uniquely exhaustive study of their history, philosophy and actual functioning. A distinguished committee of judges, practitioners and law teachers, of which Professor E.

M. Morgan was chairman and which was appointed by the Commonwealth Fund to study the problems of the law of evidence, has also drafted an extremely valuable report. The committee went beyond the law in books and has questioned judges and practitioners as to the actual operation of certain rules, such as the federal rule empowering the judge to comment on evidence and the Massachusetts hearsay statute. The root and branch expedient that all rules for the exclusion of evidence be abolished except the requirement that the evidence be relevant, has been strongly urged, but this would probably be a backward step, if the jury and the contentious theory of trial are retained. Of course, many changes in particular rules are essential for their effective working. But of more importance in the United States is the need for certain changes in attitude by the trial lawyer as well as the trial and appellate judges. The American trial lawyer might well imitate the English barrister, who rarely makes an objection except where evidence vital to the merits is seriously questionable. It is not unusual for contested murder trials in England to be completed without a single objection from the defense to the evidence. A corresponding change in the attitude of trial and appellate judges toward evidential technicalities is equally essential in the United States.

A fertile possibility for the future improvement of the law of evidence lies in the contributions which psychologists may offer to the science of proof. The psychologists have already by controlled experimentation accumulated much statistical data about the accuracy of witnesses in perceiving, remembering and reporting. Thus errors in observing colors in different lights, in identifying sounds and in fixing the direction from which they come, in estimating time periods and in determining the number of persons in a group have all been elaborately measured. Again, the degree of improvement of perception where the attention of the witness is especially directed to the object and the degree of distortion resulting from shock have both been shown to be of controlling significance in evaluating testimony. Experiments with groups reporting upon short moving picture scenes show clearly the fallibility of memory. Apparently, the curve of forgetting starts with a sharp rise but flattens out after two or three days and errors double after an interval of forty-five days. Here again, whether the observation was attentive or casual plays a great part in the accuracy and complete-

ness of the recall the extent of which has been measured. Likewise memory of words heard has been especially measured with results that not only confirm the lawyer's hostility to hearsay but arouse great skepticism of the value of testimony as to oral contracts and other oral transactions. Among the interesting findings as to reliability of reporting are those which indicate that the taking of an oath reduces the completeness of the report but substantially increases its accuracy. Comparison of results as between free narration, giving greater accuracy, and answers to questions, giving greater completeness, and as between leading and non-leading questions bears directly upon the soundness of methods of examining witnesses in court.

Equally epochal and less explored are the possibilities of psychological study of methods of judging. Contrary to court room beliefs, a psychologist finds that the emotions of a witness cannot be learned from his face. Inspired by a suggestion of Wigmore, preliminary studies have been made by W. M. Marston, a psychologist with legal training, of the effect of cross examination in revealing inaccuracy and of the relative success in judging facts from witnesses' stories by variously qualified judges and juries. The most extensive research in this field has been in the study of methods of detecting deception or guilt. The older method of measuring reaction times in a free association test, although still successfully used, seems to be yielding to the use of various devices for measuring bodily changes under excitement, such as changes in breathing, in blood pressure, in activity of the sweat glands and in muscular contraction. An apparatus for measuring changes in breathing and blood pressure of persons under questioning is reported to be in actual successful use in several police laboratories. None of these tests is suitable for actual use in court before a jury, because untrained observers cannot correctly interpret their results; these could, however, be made available through the reports of experts. In 1923 the District of Columbia Court of Appeals held that the blood pressure test was not yet of sufficient scientific acceptance to warrant the admission of its findings in evidence (*Frye v. U. S.*, 293 Fed. 1013). Wider experience with the tests will probably soon induce courts to accept them. One chief obstacle to progress in this direction is the broad gulf in language and experience between lawyer and psychologist. The lawyer tends to echo the shibboleths of an outworn psychology of faculties, grossly to overvalue oral testi-

mony as a revealer of objective fact and to be bewildered by the statistical correlations of the psychologist. The latter in his turn fails to realize the need for speed and simplicity in the court room and the inability of a jury to handle effectively the results of psychological tests. Moreover, his experiments often fail to help the lawyer because they deal with subjects different from the type of transaction usually testified about in court. A series of articles jointly written by R. M. Hutchins, at that time a law teacher, and D. Slesinger, a psychologist, points the way to fruitful cooperation. These articles criticize the legal rules of evidence relating to competency of witnesses, recording and refreshing recollection, declarations of mental state, spontaneous exclamations and acts showing consciousness of guilt, in the light of psychological and sociological findings.

Eventually, perhaps, Anglo-American court procedure may find itself gradually but increasingly freed from emphasis on jury trial with its contentious theory of proof. With responsibility for the ascertainment of facts vested in professional judges, the stress will be shifted from the crude technique of admitting or rejecting evidence to the more realistic problem of appraising its credibility. Psychologists meantime will have built upon their knowledge of the statistical reliability of witnesses in groups a technique of testing the veracity of individual witnesses and assessing the reliability of particular items of testimony. Judges and advocates will then become students and practitioners of an applied science of judicial proof.

CHARLES T. MCCORMICK

MODERN CIVIL LAW. Nowhere in the civil law is there to be found a more or less independent body of evidential norms similar to the rules of evidence of the common law. Rules of evidence appear mainly as rules of substantive law and as incidents of procedure, so that, to paraphrase Maitland, the law of evidence is secreted in the interstices of substantive and procedural law. Yet the small part which these rules play in the civil law tends at the same time to obscure the similarities and accentuate the differences between these rules and those of the common law and to act inversely as regards the widely differing rules of evidence between some of the civil law systems themselves.

The conclusion is obvious that were it not for the adumbration of exclusionary rules in the common law, due in large part to the existence of

the hearsay rule, the Anglo-American system would probably have developed along similar lines. The commonly accepted reason for the hearsay rule is the necessity of guarding the members of the jury from their own inexperience in distinguishing the probative value of evidence, and it would seem therefore that it is to the absence of the jury from continental procedure that the difference between the two systems must be laid. But although the jury is unknown in civil cases in almost all countries and in others is used only exceptionally in criminal cases, other and more positive forces have also played their part. The lesser role of counsel, having as its corollary increased importance of the presiding judge, has tended to give the court almost unlimited discretion in the examination of witnesses. The prevalence of specially trained judges has resulted in greater confidence in the ability of the judiciary. Where a certain mode of proof is admitted, rules of evidence will frequently operate merely as admonitions to the judge to disregard certain facts in reaching his decision rather than as rules excluding these facts from the record. Thus the principle of relevancy is generally accepted, but objections on the ground of irrelevancy are rarely heard in continental courts and in the practical conduct of the trial the rule seems of little consequence. Moreover, peculiarities of procedure, mainly in the reliance placed upon documentary proof, have been of supreme importance in shaping evidential rules and account for the divergence between the two main continental systems, the French and the German.

Living forces must be accounted of more importance than historical development in the evolution of the present undifferentiated body of evidential rules in the civil law. Indeed, the influence of history has rather been negative, the attempt to bind the court by predetermined, rigid rules of proof having resulted in a reaction toward the greatest possible freedom. The principles of "mathematical proof," the securing of the impartiality of the judge by forbidding personal contact with accused or witnesses, the "classic witnesses," the extortion of confessions by inquisitors, are no more. The labors of Beccaria, Voltaire and Sonnenfels against this system were brought to fruition when the French Revolution swept it out of existence. Undoubtedly some remnants of it are still discernible. The use of the oath as a means of proof still lingers as a curious survival of compurgation. The mathematical presumptions of some European laws

bear the impress of the old notion, and it may be argued that French criminal procedure is patently the offspring of the Inquisition. Yet it is too easy to be led astray. French civil procedure rests upon the use of documents, but this represents a more or less modern development from the principle that *témoins passent lettres*.

Nor must it be overlooked that striking differences exist among the civil law systems of evidence, particularly between those of Germany and France. The general principle of burden of proof, that the party asserting a claim must establish it (*ei incumbit probatio qui dicit*), runs through all the codes; the practical application of the principle varies from country to country. Everywhere presumptions are divided into those established by law and those arising from the facts, but the individual presumptions depend upon differing substantive laws. Real incompetencies of witnesses are few in number and hardly exist at all in some countries. Often witnesses may be impeached for specified reasons, yet their testimony goes into the record.

The other points at which the civil law systems agree will be found often to be such as have obtained acceptance in the common law. Continental codes generally set up certain specified modes of proof—documentary evidence, oral testimony, testimony of experts, examination of the place by the court—but these are rarely exclusive and other modes are frequently employed. The rules as to presumptions, admissions by the parties and self-serving declarations will frequently be found similar to those of the common law.

Of the two main continental systems, the French, followed more or less closely by Italy, Belgium and the Netherlands, contains a larger body of exclusionary rules. Yet an examination of these rules reveals clearly their inseparability from substantive and procedural law. In the main these rules are resorted to for determining whether or not any sort of oral testimony is to be admitted. The *Code civil* (art. 1316) details five means of proof, documentary, oral testimony, presumptions, admissions of the parties and oaths. In reality these categories are not exhaustive; among others, inspection of the scene must be included. Theoretically, judicial notice of rules of foreign law is not permissible and they must be proved by the parties. A few absolute incompetencies of witnesses exist, e.g. insanity, and witnesses may be excluded for certain reasons at the request of a party (*reproche*).

But all modes of proof excepting the docu-

mentary are resorted to only exceptionally. The essence of the trial in civil cases is the submission to the court of documents tending to establish or defeat the establishment of obligations. These documents are of two kinds, authentic instruments (*actes authentiques*) defined as an instrument "received by public officers entitled to practice in the place where the instrument was drawn up and with the requisite solemnities" (*Code civil*, art. 1317) and private agreements (*actes sous seing privé*). The most important exclusionary rules relating to documentary proof are those providing that commercial books may be admitted as proof only between merchants (*Code de commerce*, art. 12) and that ordinary memoranda may not be used in favor of the party writing them.

The secondary importance of oral testimony in French procedure derives in the first instance from the substantive provision of art. 1341 of the *Code civil*, which provides that an instrument must be drawn up before a notary or under private signature for all matters exceeding one hundred and fifty francs and that no testimony by witnesses is admissible to add to or to controvert the contents of these instruments. This provision is an adaptation of the *Ordonnance de Moulins* of 1566, which abolished the previous rule of French jurisprudence that oral testimony prevailed over written. Standing alone it might have affected the French law in much the same manner as the statute of frauds and the parole evidence rule affected the common law, but procedural rules have saved it from emasculation. Oral testimony is taken not in open court but before an individual judge, the *juge-commissaire*, in a proceeding known as the *enquête*. Such a proceeding will be instituted only in certain defined cases, such as in commercial transactions, where the creditor cannot obtain documentary proof of the obligation, e.g. in obligations arising from torts or quasi-contracts or where the creditor has lost the documentary evidence through an unavoidable accident or where there is a *commencement de preuve par écrit*. This latter is defined as any written instrument which emanates from the person against whom the claim is made or from the person he represents and which renders probable the fact alleged (*Code civil*, art. 1347). Typical cases are recitals in an authentic instrument which are not relevant to the principal covenant and the domestic papers of a father or mother tending to prove the legitimacy of a child. Once the *enquête* is instituted, however, there are no restrictions on the testi-

mony. The questions are put by the judge and the parties may not interrupt a witness nor ask him any direct questions (*Code de procédure civile*, art. 276).

The same fundamental principle of primary reliance on documentary proof is carried through in criminal cases. Here the *procès-verbaux* or reports of police or administrative officers constitute written evidence before both the preliminary magistrate (*juge d'instruction*) and the trial court. The judge in both instances may hear oral testimony, and when he does so the same freedom from exclusionary rules obtains.

The salient point of departure in the German system lies in the greater reliance on oral testimony. Moreover, the principle of free evaluation of evidence is more extensively employed (*Zivilprozessordnung*, sect. 286). Express provision is made in the code of civil procedure for five modes of proof: inspection of the place, testimony of witnesses, expert testimony, documentary evidence and the oath. An important difference from the French system is the wider acceptance of the principle of judicial notice. No evidence is required of facts notoriously known to the court (*Zivilprozessordnung*, sect. 291). In collegial courts it suffices if the facts are known to a majority of the members. Nor are the judges bound to accept the testimony of the parties on the existence of foreign law but may find it out in any way they can (*Zivilprozessordnung*, sect. 293).

While there exist no incompetencies of witnesses properly speaking, the privileges of witnesses go far beyond the French law and are substantially similar to those of the common law; relationship by blood or marriage, professional and state secrets, self-incrimination, danger that a direct property damage or dishonor may result to the witness, are included. Aside from these privileges of the witness the parties may ask any questions which they consider necessary to explain the matter in question or to determine the relation of the witness. Parties do not testify as witnesses, but their testimony is given under the form of the party oath.

The great freedom in the admission of evidence in the civil law becomes obvious when it is compared with that which obtains not only in the common law but other systems of law. Thus the Mohammedan law of evidence contains a much larger body of exclusionary rules and approaches closely the common law system. Oral testimony is the chief means of proof and documentary evidence is resorted to only exception-

ally. A certain number of positive incompetencies of witnesses exist: parties may not testify, a father may not testify in favor of his son, children and persons in certain degrading occupations are incompetent. The principle of mathematical proof still obtains: the testimony of a single individual is generally insufficient; usually two male witnesses or one male and two female witnesses are required. An interesting parallel to the hearsay rule exists in the exclusion of "indirect" testimony. Exceptions are made in regard to evidence as to the paternity, marriage or death of an individual and where a party to a contract is dead or absent. In the latter case the testimony of any person who had heard the party state that he had assisted at the execution of the contract is admissible. Declarations of a party are admissible only when a presumption in his favor arises from the circumstances. Many presumptions of law are laid down but these differ among the various schools.

Interesting as other systems are, they seem destined to vanish before the spread of the civil law. The Japanese and Turkish codes of civil procedure borrowed from Germany mark the introduction of civil law principles of evidence into Asia. In British India both Hindu and Mohammedan principles have been displaced by the English rules through the passage of the Indian Evidence Act of 1872. The procedural law of Egypt has long followed that of France. Chinese procedural law is in the process of revision. The desire to shake off the burden of treaties imposing extraterritorial rights has hastened the Europeanization of the law of evidence, already rendered inevitable by the triumphal march of the civil law.

EVOLUTION. The word evolution has been applied by many writers to any process of change or becoming, but this use of the expression is not defensible. It should be restricted to cases in which two factors enter, an organism and an environment; thus its principal application is in biology, where living creatures and their inorganic surroundings are both present. We cannot speak of the evolution of the universe but only of its flow of change. Evolution, then, means primarily the passage from simplicity to complexity, from homogeneity to heterogeneity, which, from empirical observation of living creatures and their remains, may be deduced to have occurred and to be still occurring in the world of life.

The difficulties caused by the entry of the evolution concept into the world outlook of modern man arise from the fact that it is a doctrine drawing its being from two distinct realms of human experience, science and history. It is scientific in that it deals with the concrete objects of biology and therefore speaks the language of the laboratory, but it is historical in that it deals with non-repeatable occurrences, which are thus outside the realm of scientific investigation although not outside that of scientific imagination and speculation.

Evolution must not be superficially equated with progress, unless progress be defined as progress toward perfect adaptation to environment. There are numerous cases of organisms which retrogress, as far as complexity is concerned, such as the sessile tunicates, which in each life cycle lose their structural and locomotory vertebrate features, retaining only nutritive, respiratory and generative mechanisms. The same is true of large numbers of parasites. The best adapted type is not necessarily the "highest." Evolution as a biological theory must be entirely freed from ethical questions, and moral standards must not be imposed on the world of living creatures. But the opposite fallacy, the confusion of origin with value, must also be guarded against. What a thing is, is not explained by saying how it has come to be there, any more than it is possible to say how it has come to be there by saying what it is.

Whether the process of evolution has taken place continuously or discontinuously is a problem which will probably never be solved, for continuity and discontinuity are two alternating modes of scientific expression neither of which is permanently victorious. The question arises in two ways. There is, first, the psychophysical difficulty, since mind may or may not be co-extensive with life and may or may not have evolved parallel with the physical phenomena of living things. The theory of emergent evolutionism is the principal modern representative of the discontinuity view; it speaks of matter, life and mind as a series of levels rising above one another by a succession of steps, at each of which an external creative activity injected an essentially novel element. Some authors, on the other hand, regard mind as coextensive with life or even with matter, and in this way the complete continuity view is at last reached. Secondly, the question arises in more technical form when the biologist studies the mechanism of evolution. An infinite series of infinitely small differences may give an evolution, and this was the common view in the middle of the nineteenth century. But, on the other hand, evolution may occur as the result of a smaller number of appreciably large sudden jumps, or mutations. In modern times this discontinuity view has been incorporated into the theory of the gene, by which the biology of inheritance seeks to account for evolution.

The evolution theory appeared first, as far as is known, among the ancient Greeks, but it did not succeed in taking any root in the ancient

world. This is so much the more peculiar in that Aristotle applied the notion of biological development to ontogeny, the development of the individual from fertilized egg cell to adult, while quite failing to apply it to phylogeny, the sequence of adult forms in time. Two thousand years later the same position was taken by Hegel. Perhaps both philosophers felt that things can only be understood in the light of the ends to which they are tending and that the rational, although everywhere present and permeating everything in nature, is everywhere disguised. If the order of development from lower to higher were also the order of temporal development, this disguise would be gone. But neither Aristotle nor Hegel was able to conceive of any mutability of organic types; such a conception is essentially post-Darwinian.

The pre-Socratic Ionian philosophers were led to the concept of evolution by the distinction which they made between the shifting temporal flux of phenomena and the eternal changeless reality beneath. To Heraclitus, it seems, only the former existed and as but a kind of chaos, but Empedocles discerned a gradual development in the processes of life and taught that imperfect forms are slowly replaced by more perfect ones. The atomists, Democritus and Epicurus, have often been claimed as evolutionists, but it is doubtful how far this claim can be substantiated. Hippocrates, so important a figure in other respects, has little of an evolutionary character, and it was not until Aristotle that an important advance was made. Aristotle was undoubtedly the first great comparative biologist, the first man to realize the importance of comparing one type of organism with another.

In order to formulate their relationships he arranged them in a *scala naturae*, or ladder of nature, beginning at the lower plants, going on to the higher plants, the "zoophytes," the sponges, holothurians, ascidians, and so up to mollusks, crustaceans, other arthropods, fishes and mammals. "Nature," he said, "passes from lifeless objects to the highest animals in such unbroken sequence, interposing between them beings which live and yet are not animals, so that scarcely any difference seems to exist between two neighbouring groups owing to their close proximity." For Aristotle this ladder of nature always remained temporally static, the form in which the Prime Mover had created living organisms from the beginning. Nevertheless, in his embryology he distinguished a succession in time of ever more complicated states

and declared himself in favor of epigenesis rather than preformation, i.e. of the production of form from not-form, rather than the mere unfolding of form which was present, although invisible, from the beginning. Furthermore, he distinguished between the vegetative, the animal and the rational soul, and asserted that the embryo was additively animated by each of these in turn as it developed.

Alexandrian and later Hellenistic biology did not further elaborate Aristotle's rudimentary evolution theory nor did the mediaeval Aristotelians, such as Albertus Magnus. Leonardo da Vinci, however, appreciated the true nature of fossils. More important were the progressive steps toward a satisfactory classification of living organisms made by Matthias de l'Obel (1538-1616), Andrea Cesalpini (1519-1603), Joachim Jung (1587-1657), John Ray (1627-1705) and Karl Linnaeus (1707-78). In the eighteenth century such writers as Charles Bonnet took up again the Aristotelian ladder of nature but gave it no temporal significance. Their insistence on a scale of infinitesimal gradations passing from inanimate matter to man was, however, of some historical importance and led in the following generation to the *Naturphilosophie* school. In the persons of Goethe and Lorenz Oken this school emphasized chiefly the idea or type common to many subgroups of organisms but obscured in any one subgroup by special adaptations of form. Parts of the flower were found to be modifications of leaves, and missing vertebrae were located in the skull. The conception of mutability of species was, however, still non-existent or almost so. In 1825 M. H. Rathke made the important discovery that structures homologous with the gill slits of fishes exist for a time in avian and mammalian embryos.

The theoretical approach to evolution had begun somewhat earlier than the *Naturphilosophie* school. Buffon (1707-88) instead of being interested, like Linnaeus, in minute differences between organisms was more impressed by their similarities. He was also the earliest eighteenth century biologist to doubt the fixity of species, noting that animals often have parts to which no special or adequate use can be ascribed (they would now be called vestigial organs). He considered that some species are degenerate forms of others, the ape a degraded man, the ass a degraded horse and so on. Buffon's ideas were examined by Erasmus Darwin (1731-1802), who held that species may undergo changes in the course of time and that changes produced by

the environment are passed on to the offspring. This was the first statement of the Lamarckian view, which was put forward in detail shortly afterward by J. B. Lamarck himself (1744-1829). Accepting as undeniable the fact that species vary under external influences and are subject to progressive development, he studied the mechanism of these changes and enunciated the principle of use and disuse, which ascribes changed structure to changed habits and involves the inheritance of acquired characters.

At this stage what would now be called the social sciences exerted a profound influence on biology. Just as a botanist introduced to physics the wide range of osmotic phenomena, so the further course of the evolution theory was guided by an economist. Malthus' *Essay on Population* (1798) with its contention that periodical checks on the numbers of human groups are biologically necessary came at a time when the "rights of man," "natural justice," the "return to nature," the "noble savage" and Franklinism filled the intellectual atmosphere, and it sounded a timely warning with respect to the difficulties of overpopulation. Both Darwin and Wallace admitted that the essay of Malthus had introduced to their minds the idea of natural selection as an evolutionary factor. Charles Darwin (*q.v.*), the grandson of Erasmus Darwin, published his *Origin of Species* in 1859, and his name has been so much associated with evolution theory ever since that to many people Darwinism means evolution. Evolution theory, however, existed before Darwin, and the two questions whether evolution has occurred and how far natural selection can account for it are entirely different.

"In October 1838," said Darwin, ". . . I happened to read for amusement 'Malthus on Population,' and being well prepared to appreciate the struggle for existence which everywhere goes on, . . . it at once struck me that under these circumstances favourable variations would tend to be preserved, and unfavourable ones to be destroyed. The result would be the formation of a new species" (*The Life and Letters*, vol. i, p. 83). Darwin and Wallace, having recognized each other's conclusions as fundamentally identical, published a joint essay the year before the *Origin of Species*; and this was, as Singer says, the first public pronouncement in which an effective mechanism was suggested to explain the evolution of organic forms. This mechanism could be described by four propositions: that gradations exist in the perfection of organs and instincts, each good of its kind; that

all organs and instincts are in ever so slight a degree variable; that there is a struggle for existence leading to the preservation of each profitable deviation; and that these profitable deviations are inherited. Yet Darwin's position suffered from certain inherent weaknesses. He believed in a continuous system of change and argued that domestic breeds, for instance, had been obtained by the selection of very slight individual differences, although this is probably not the case. He did not account for the early stages of a favorable variation; a lung so little developed as to confer no power of breathing air would be of no advantage. Finally, his conception of heredity was as crude as Lamarck's. But it is impossible to overestimate his importance in the history of evolution theory.

His views were developed by Huxley and Spencer. Herbert Spencer (*q.v.*) was a philosopher, not a biologist, and had been advocating an abstract theory of evolution some years before the publication of Darwin's great work. His writings bear throughout a certain quality of a priori dogmatism in great contrast to the modestly presented but overwhelmingly convincing enumeration of facts which is found in Darwin, but historically he had a great influence on his time. His system, constructed very much as might have been expected from a man who by training and temperament was an engineer, was very much in the taste of the period and contributed powerfully to the general acceptance of the concept of evolution. Thomas Henry Huxley (*q.v.*) exercised his influence as a champion of Darwin's theories against theological opposition.

More important scientifically were the writings of the Darwinian embryologists. Aristotle's ladder of nature was at last to be unified with his ontogenetic succession. Fritz Müller (1821-97) broke away from the older embryologists, such as K. E. von Baer (1792-1876), who had seen in the developmental stages of the higher animal a succession comparable with the various lower animals but had not interpreted this structural relationship as really a relationship of descent. Müller, who studied crustacean embryology, maintained that the series of developmental stages is a historical document. This in due course led to the work of Haeckel, Kowalevski and F. M. Balfour.

It has been said quite rightly that biologists today are more certain than ever that evolution has taken place, but are not so certain as they were about the method by which it has taken

place. The main influence which has acted on the modern theory of evolution has been the experimental study of inheritance. This took two paths, one cytological, the other statistical. August Weismann (1834–1914) identified the cell nucleus and the chromosomes within it as the physical basis of heredity. Gregor Mendel (1822–84) investigated the phenomena of crosses between races (e.g. tall and dwarf peas) and explained them on the basis of postulated factors within the individual organism controlling the visible characters. Each pea plant, for instance, would possess two height influencing factors; both of these might be for tallness or both for shortness or there might be one of each. Characters were divided into dominant, if only one factor was necessary, or recessive, if two were required to be present to bring about the visible effect. Mendel's work was the beginning of all modern genetics. Parallel with these tendencies went the study of discontinuous variation by William Bateson (1861–1926) and Hugo de Vries (1848–). Mutations, or sudden jumps, were actually observed and these play a great part in modern speculation, the problem now being to ascertain in what way the genes (Mendel's factors) can be so modified as to produce a sudden change to another comparatively stable state. With the technique of studying large populations of an organism in captivity under controlled conditions (e.g. T. H. Morgan's work on the fruit fly, *Drosophila*), it became possible to measure mutation rate quantitatively. It has been found to be greatly affected by X-rays, and it has been suggested that the course of evolution as a whole was due to the effects of natural radiation, either from outside the earth or from radioactive substances in living organisms or their surroundings. Careful computations, however, have not encouraged this view.

Indeed, neither Darwinian variation nor Mendelian mutation seems as yet quite to account for those fundamental differences on which the genera and species depend. In particular, the theory of the gene, although undoubtedly able to demonstrate the reason why one animal has a green liver and another a pink liver, simply assumes that the same mechanisms explain why one animal has a liver at all and another a hepatopancreas. Still less is it possible to offer an explanation for the paucity of "missing links" between the phyla of the animal kingdom, for it will hardly do now to throw all responsibility upon the imperfection of the geological record, as was the common practise in Darwin's own

day. Whereas complete series of types can often be found within phyla, this is not the case between them. Some biologists consider therefore that the early stages of evolution were not monophyletic, as classical theory would suppose, but polyphyletic. On this view the phyla of today do not all arise from a common ancestor but from a limited number of ancestors, a limited number of possible lines of evolution into which primordial living matter separated itself as soon as it began to vary at all.

The idea of fitness—that only those organisms survived which fitted themselves to their environments—while introduced by Darwin, was much elaborated by Spencer and seemed to do away with teleology, since variations would arise by chance and what happened to fit its surroundings would be perpetuated. L. J. Henderson, however, showed that the relation of fitness was in reality a reciprocal one, the environment being fitted to living organisms just as much as living organisms are fitted to it. Cosmic teleology has thus a perfectly sound status in philosophy, while at the same time it does not interfere with mechanical modes of explanation in biological science. Of these natural selection still remains the most important. The calculations of A. J. Lotka, R. A. Fisher and J. B. S. Haldane show that it may be almost as important as Darwin himself thought it. On the other hand, neo-Lamarckianism, as it is called, continues to lay emphasis on the principle of use and disuse and the inheritance of acquired characters. The experimental evidence, however, which is from time to time brought forward in support of this doctrine (as in the work of Kammerer and Harrison) has so far failed to survive the general critical consideration of biologists. Nevertheless, those biologists who believe that a biological story cannot be told save in psychological terms naturally persist in holding various degrees of non-Darwinian opinion.

If the present array of living organisms is the product of a long evolutionary process, one would expect to find some indication of the fact in fossil remains. Geologists have long been able to ascribe more or less accurate dates to the various strata in the earth's crust, and it has been by examination of the animal and plant remains at different depths that much of the evidence in favor of evolution has been accumulated. The primary fact is that the oldest deposits of rock contain the simplest forms and that the nearer one approaches modern times the more complicated and specialized the re-

mains become. Thus in the strata of the Cambrian period the characteristic kinds of animals are lower invertebrates, mollusks, trilobites and corals; in the Silurian strata the fishes with cartilaginous skeletons predominate; in the Permian and Triassic, the reptiles and primitive mammals. Primates begin to appear in the Miocene, and eventually the bones of forms intermediate between apes and men appear. In certain cases the series of related animals can be traced through closely similar stages during long periods of time; thus the origin of the horse from its five-toed ancestor can be observed in detail. One of the most fascinating problems of evolution is involved in the disappearance of dominant types, such as the reptiles, which were once the supreme terrestrial group and only after a considerable time yielded their place to the mammals and birds.

The arguments for evolution from morphology are all based on the resemblances between the structure of different animals and the ability of the theory to explain these as due to derivation from a common ancestor. The members of any great group possess a common ground plan. Thus the crustacea have a certain number of appendages, some modified for swimming, others for egg carrying, walking, prehension, mastication, smell and touch; the more locomotory appendages there are, the fewer the nutritive ones, but there seems no reason why this should be so except that the ancestor had a limited number and the descendants have specialized in various directions. Again, the limbs of vertebrates show a common plan of structure with diverse modifications; thus the wings of bat, bird and pterodactyl are all variations on the theme of the pentadactyl limb. Rudimentary or vestigial organs, inexplicable save on some theory of descent, occur very frequently in animals and plants, e.g. the semilunar fold of the human eye, the mammalian pineal gland, the limbs of whales or, to take botanical examples, the leaves of the parasitic dodder, reduced to tiny scales, and the staminodia, or functionless stamens, of many flowers. The fact that animals fall naturally into a group-within-group classification, which may be compared to the branching of a tree, although established by systematists long before Darwin, did not receive its logical explanation until it was interpreted as the result of gradual divergence and descent from common ancestors.

In the embryonic development of all vertebrates there appear on the sides of the neck

region a series of slits, which in fishes and amphibia join up with corresponding slits pushed out from the pharyngeal wall. This is the origin of the gills. But although the slits are formed in reptiles, birds and mammals, their development is for the most part cut short; nevertheless, the Eustachian tube in man is derived from one of these slits. Generally speaking, all traces of gill slits disappear in the adult mammal. But still more remarkable, the arterial system of the human embryo develops exactly as if it were planned to supply blood to the gills of a fish and only later becomes modified into the permanent vascular system. Again, the apodic amphibia have complete limbs while still in the embryonic state, the "flat" pleuronectid teleostean fish has one eye on each side of its head before it hatches, and the crab at the megalopa larval stage just after hatching has an abdomen as large as that of a lobster or a prawn. The collar bone is absent in sheep, deer and many other ruminants, but in the embryo sheep it is completely formed. Embryos thus betray the ancestry of their species. But with exactly what degree of clearness they betray it has been much discussed among embryologists, and in maintaining that ancestral adult stages rather than ancestral embryonic ones could be described from the appearances of embryos Haeckel has not been followed by the majority of investigators. Yet on the fundamental thesis that embryonic development is a historical document there is no disagreement.

Chemical as well as morphological tests of genetic relation exist. The blood of animals responds to the introduction of foreign proteins, such as are contained in the blood of another species, by the production of antibodies and precipitins. Although sensitized blood serum reacts most strongly by precipitation to the blood of the animal used in producing the sensitized condition, it also reacts more or less to the blood of related species. It has been found that the degree of reaction runs roughly parallel with the degree of structural similarity, and in this way affinities of descent may be charted out. Thus human blood reacts most strongly with the blood of anthropoid apes, next with that of Old World monkeys, next with that of New World monkeys and least strongly with that of lemurs. Again, mammalian blood, as has long been known, is very similar, as regards the composition of its ash, to sea water. The probable changes in the composition of the ocean during geological time being known, it is possible to obtain a

picture of the evolution of terrestrial forms by comparing their blood with sea water. Chemical phenomena of recapitulation are also seen in the appearance and disappearance of certain enzymes during embryonic development. The course of evolution must have been largely conditioned by chemical factors; thus it has been said that mammals would have been impossible without the blood pigment, haemoglobin, and the terrestrial oviparous animals without uric acid.

Once launched in the scientific world, the evolution concept became the center of furious controversy in the intellectual life of the nineteenth century. Its most obvious impact was on the theological problem of authority. The doctrine of special creation and even that of the immutability of species were embedded in the Old Testament; and wherever the automatic writing view of the Scriptures or the belief in literal inspiration was dominant, a clash with the evolutionists could not be avoided. The defenders of the book of *Genesis* were perfectly logical in wishing to exclude the sacred writings from all criticism, for they realized, perhaps unconsciously, that criticism would not stop there and that the historians and anthropologists were only waiting until the biologists had finished with the Old Testament before they attacked the New. The whole extraordinary story of Bishop Colenso, whose mild emendations provoked such fury, is well worth reading as a view of the temper of the time. Other excellent accounts may be found in the autobiographies of Gosse (from the point of view of an English layman) and in Houtin (from the point of view of a French priest). Modern liberal theology, realizing that scientific criticism of the Biblical corpus must have a completely free hand and that the historical events themselves are much less important than the ideas and concepts which they involve, finds it difficult to understand the bitter atmosphere of nineteenth century polemics.

In part the opposition to evolution theory was connected with that general aversion to scientific investigation which is present in all epochs but attaches itself now to one, now to another, of its forms. Thus in the Middle Ages chemistry was invested with an unholy glamour; and the opposition to biological evolution theory in the last century has in the present been transferred to psychology, which is often regarded as unearthing many things which would be better unknown. Such opposition, however, only stim-

ulated the tendency to exalt natural science into a philosophy; and scientific naturalism, the philosophical form of nineteenth century materialism, found in evolution theory one of its principal pillars. The world, consisting wholly of matter and fundamentally a fortuitous concourse of hard round microscopic billiard balls, had come into existence by chance and not as the result of any intelligent design. Life, originally produced by some haphazard collocation of carbon compounds and the colloidal state, had obeyed the Spencerian law of increasing heterogeneity and had produced an infinite number of forms, most of which had been destroyed in the course of evolution. And it was here that the Darwinian hypothesis of natural selection fitted in so perfectly with the world outlook of scientific naturalism, for in abolishing purposiveness in biology, either individual, on the part of the animals (as in Lamarckianism), or general, on the part of the whole process, it made biology safe for the physicist and opened a magnificent vista (which is not yet nor likely to be closed) in which physics and biology are seen to be one science.

Materialism, however, or what comes to the same thing, natural science regarded as a philosophy, suffers from one serious defect; namely, that being a theory it happens to be a product of mind. It is never easy to see on what ground a materialist can have sanction for his materialism, since materialism is nothing if not a system of thought. And a similar undermining process did in fact take place historically, for biological evolution theory while at first seeming to support scientific naturalism was presently seen to be deserting to the other side. Mind as a product of biological evolution would probably be better adapted for practical and mundane uses than for grasping absolute truth. From this consideration there arose the whole anti-intellectualist movement, mainly represented by Bergson and the pragmatists and chronicled by Aliotta. What Ward and Bradley were unable to do by attacking scientific naturalism from the front on the basis of idealist philosophy, was accomplished by Mach, Avenarius and Bergson by a rear attack; and this was in its consequences even worse than the first, since now not only biology but physics too was assailed and shown to be, however useful as a science, anything but satisfactory as a philosophy.

Another important consequence of the evolution concept was largely psychological. The biology of the nineteenth century was no longer

content, like that of the previous century, to dwell largely on the more edifying aspects of living organisms; on the contrary, it faced all the facts it could and described calmly such phenomena as parasitism, putrefaction and the struggle for existence. This raised the problem of evil, that perennial difficulty of religious thought, in an acute form; and biologists such as Romanes particularly emphasized the universality of disease, pain and death, although it is likely that he very much overestimated the importance of pain in organisms with undeveloped nervous systems. Nevertheless, the issues raised by biology forced all progressive theologians to reconsider their positions very carefully at this time. Such a book as the *Education of Henry Adams* shows how the theory of evolution entered into the thought of every man who lived in the intellectual climate of his period.

The insistence on the seeking out of origins, which characterized the end of the nineteenth and the beginning of the twentieth century, may to a large extent be attributed to the influence of evolution theory. The origins of religion from primitive animism, of episcopal miters from Mithraic hats or of mystical experience from sublimated sex instinct were urged in a sense derogatory to the end products, and at first it was insufficiently realized that origin is essentially irrelevant to questions of value. Against these attacks there was little defense. The apparatus of theology, as Balfour put it, is "much better contrived for dealing with the points on which theologians differ than for defending against a common enemy the points on which the theologians are for the most part agreed" (*The Foundations of Belief*, 8th ed., p. 177). The early victories of scientific naturalism led to a theological stampede, but this was not lasting; and while modern liberal theology is united in acceptance of evolution it does not admit the naturalist claim, which used to be allied with it, that the scientific method is alone competent to acquaint man with the nature of the world in which he finds himself.

Philosophical examination of the nature of scientific law has also led to a great difference in the outlook of the twentieth century as compared with that of the nineteenth, for no small part of the past polemics was due to a mistaken conception of scientific "law" as legislative. Regularities which may be observed in nature are by no means the same thing as regularities imposed upon nature by some external creative force. This was a concept taken out of jurispru-

dence and misapplied in science, but even more numerous were the concepts taken out of natural science and misapplied in the social sciences. Thus evolutionary continuity has been used by some writers as an argument for slow social development and parliamentary methods; evolutionary discontinuity has just as commonly been used as an argument for revolutionary changes. Social selection in human communities has been identified with natural selection, and the survival of the fittest has been constantly used by capitalist writers as a rationalization for laissez faire doctrines. The temptation to carry over the phenomena of recapitulation into the mental field and to speak of mental stages passed through by each human child as representative stages in the past history of the race has been too great to be resisted. Certain physical phenomena of childhood as described, for example, by Hrdlička certainly seem to merit an evolutionary explanation. But in general further critical work is needed to investigate the degree of applicability of the recapitulation concept in this field.

EVOLUTION, SOCIAL. The idea of a changing and transmuting society was foreign to primitive culture. Conservative and self-complacent, primitive men thought of the present as heir to the past and of the future as a projected present. No idea of social progress was formulated. Whatever was done by men deliberately as a contribution to the social process chiefly concerned conservation not change. Innovations made or brought in by individuals were not unknown, but they were primarily concerned with particular things, rites or customs, and no attempt was made to fit these into a scheme of improvement. There were some exceptions, however, as when the Iro-

quois Indians in the sixteenth century formed a league or confederacy for the preservation of peace.

Among the Greek thinkers both Plato and Aristotle entertained definite notions about social change and the possibilities of its direction by legislators. Plato, who projected a new society based on ideals deduced from rational principles, thought little of the trends and resistances of social institutions. Aristotle, on the other hand, taught that social structures had flourished and decayed many times in the past; he discussed at great length the various tendencies which impede or enhance social change or a particular kind of change and never tired of warning legislators and social reformers against proceeding too precipitously. No significant advances in the theory of social change were made until the seventeenth century. Both Thomas Hobbes in the *Leviathan* (1651) and John Locke in *Of Civil Government* (1690) drew inferences from the conditions of modern savages concerning those of the primitive ancestors of civilized peoples. The search for cultural similarities was stimulated by the interest taken by Cartesian science in the uniformities and laws underlying the diversity and apparent disorder of the sensible world. The similarities observed between the cultures of savage contemporaries and those of the primitive ancestors led to the notion of stages of development. Bossuet in his *Discours sur l'histoire universelle* (1681) distinguished twelve successive cultural epochs. Building upon Bossuet but with an emphasis upon progress rather than mere temporal sequence Turgot in his *Plan de deux discours sur l'histoire universelle* (1750) traced culture from a hunting stage through pastoral life and the rise of agriculture to the beginnings of government. The tendency to consider culture history as a series of progressive stages received its definitive expression in Condorcet's *Esquisse d'un tableau historique des progrès de l'esprit humain* (1793). David Hume had contributed to the theory of cultural change in his essays, *Of the Rise and Progress of the Arts and Sciences* (1742) and *Of National Characters* (1748). He had rejected the environmentalism of Montesquieu's *L'esprit des lois* (1748), in which national differences were traced to differences in physical environment. He stressed the importance of tradition and imitation as molders of local peculiarities, ascribed preservation and conservatism to the influence of powerful governmental agencies and explained

change and advance as due to normal and persistent fluctuations or the "inconstancy to which all human affairs are subject," to the influence of nation upon nation, to the ideas of exceptional individuals and to violent interruptions of government or of learning brought about by diverse causes which break down tradition and pave the way for the new.

In the nineteenth century the immediate precursor of modern evolutionism was Auguste Comte, whose *Cours de philosophie positive* (1830-42) foreshadowed the ideology of the classical evolutionists in several important particulars. Building upon Pascal's analogy between the life of an individual and that of the race Comte for the first time adopted the use of the comparative method on a large scale, confident that the early stages of civilized groups may all be observed among primitive peoples distributed in different parts of the globe. In surveying the vast array of cultural forms thus brought into view—forms conceived by Comte as changes achieved in the cultural advance of mankind—he made the following significant assumptions: cultural changes are slow, gradual and continuous; they follow an order which is fixed and determined; and the differences between separate cultures are due to the speed with which different social groups pass through the successive stages. This brought social thought to the very doors of classical evolutionism. Arguing that every phase of culture, moral, intellectual, technical, must pass through the same stages and that these stages were identical for all periods in history Comte simplified his task by restricting his examination to the intellectual development of western Europe and thus reached the philosophical law of the three stages—the theological, the metaphysical and the positive.

Herbert Spencer was undoubtedly influenced by Comte, but the more significant predecessors of Spencerian evolutionism were Karl Ernst von Baer, the embryologist, Charles Lyell, the geologist, and Thomas Robert Malthus, the political economist. In his *Über Entwicklungsgeschichte der Thiere* (2 vols., Königsberg 1828-37) von Baer had established the biological principle that ontogeny recapitulates phylogeny; that the embryonic individual passes in somewhat abbreviated form through the stages represented by the different species of animals. Charles Lyell had sounded a dynamic note in his *Principles of Geology* (2 vols., London 1830-33) by introducing the concept of stratification.

Malthus had formulated in the first edition of his *Essay on Population* (1798) the principle that while the food supply increases in an arithmetical ratio population increases in a geometrical one, resulting in inevitable pressure on the food supply. From this theory Spencer derived the concept of survival of the fittest. Spencer's dependence on Darwin in the broader field of evolution should not be exaggerated. As can be gathered from an examination of his *Prospectus*, the *First Principles* (1862) and the first edition of the *Principles of Biology* (2 vols., London 1864-67; rev. ed. 1898-99) his own ideas were already developed in definitive form, except in regard to the theory of natural selection, when he became acquainted with Darwin's work. Before Spencer could pursue the main argument of the *Principles of Sociology* (1876-96) or E. B. Tylor that of his *Primitive Culture* (1871) they had to meet the theory of degeneration propounded by the theologians to the effect that primitive cultures represented degenerated remnants of once higher civilizations. Spencer countered with the observation that these hypothetical higher civilizations, if granted, must have once developed from more primitive conditions and that the argument of the theologians instead of meeting the problem was merely deferring its solution. For Spencer the development of society or culture represented but one phase of universal evolution. The progressive redistribution of matter and motion, the change from the simple to the complex, from homogeneity to heterogeneity, the integration of wholes and the differentiation of parts and all the other aspects of evolutionary change which applied to the astronomical cosmos, the earth, the species of plants and animals, the history of mind, also held true for the history of human culture. Except in a few passages Spencer held that these changes in all domains led to the development of progressively higher forms, a view held by most evolutionists but not inherent in the concept of evolution. In the general exposition of his thesis Spencer held that evolutionary change applies to culture as an integrated whole, but he also traced separately the evolution of the different aspects of culture, such as religious, industrial, military and professional institutions. He omitted discussion of material culture and technology, an omission found also in Wundt's *Völkerpsychologie*, but other evolutionists have filled this gap. The effect of his exposition of the theory of social evolution was magnetic.

After brief resistance social theory began to reflect its influence everywhere, especially in Russia, France, England and the United States.

In the search for origins interest had long been centered on the primitive or preliterate period in man's development, where chronology was vague and relatively few facts were accurately known. It is in this field that the evolutionists made their contributions. In the domain of social organization the theory of Henry Maine was overthrown by J. J. Bachofen, Swiss classicist, John Ferguson McLennan, Scotch jurist, and Lewis H. Morgan, American anthropologist. Maine had taught the priority of the patriarchal individual family. The evolutionists held that the earliest form of social structure, following upon the primal "undivided horde," was based upon the clan, a unilateral hereditary unit with maternal descent. It was their belief that in the course of historic development this was followed by the gens, a unilateral hereditary unit with paternal descent, and that at the dawn of the historic period the gens ceded its place to the bilateral individual family with patriarchal features. Morgan's argument in support of this scheme was based on a vast array of data collected by him and others in many parts of the world, consisting of relationship systems and associated terminologies which were interpreted as indicating corresponding forms of social organization and especially of marriage. Marriage was represented as having had its beginning in a state of promiscuity—no sexual regulations whatsoever—which reigned in the original horde. After two forms of group marriage, in which certain classes of men and women were regarded as actual or potential husbands and wives, individual marriage emerged. Bachofen taught in addition that the period of maternal descent, the clan stage, was characterized by the precedence of woman in socio-political matters—a matriarchate. This scheme was accepted and utilized by such writers as J. Kohler, Friedrich Engels, Maxim Kovalevsky, Peter Kropotkin, H. Cunow and others.

In religion Spencer and Tylor established the doctrine of animism as a "belief in spiritual beings" (Tylor's minimum definition of religion) derived in the main from dream experiences. Spencer stressed in addition the genetic priority of the human spirit or ghost. He regarded fear as the emotional root of religion, inventing in this connection his famous aphorism: all religion comes from the fear of the

dead, all society from fear of the living. In discussing worship he placed ancestor worship at the bottom of the genetic scale. J. G. Frazer taught the priority of magic to religion; F. B. Jevons identified totemism with plant and animal worship and then derived the cultivation of plants and domestication of animals from totemism. The works of Andrew Lang, E. S. Hartland, Grant Allen, Laurence Gomme and in the United States those of Daniel Brinton were similarly oriented. In art A. C. Haddon argued that realism, based on the representation of natural creatures and objects, came first; that this was gradually conventionalized, assuming more and more geometrical features, and that finally the original realistic connotations became attached to these geometrical features in the form of symbols.

Similar schemes prevailed with reference to economic conditions and property. Economists like Karl Bücher and popularizers like C. Létourneau taught the doctrine of three stages of economy: hunting, pastoral life and agriculture. Other forms of the three stages were read into the archaeological record: the ages of stone, bronze and iron. Communal property ownership was regarded as the universal primitive form from which individual ownership became differentiated in later periods. Periods and stages were constructed by writers like J. Kohler and A. Post with reference to legal forms and concepts.

In dealing with these diverse topics the evolutionists assumed a general psychic unity of mankind, a notion they had derived from pre-evolutionary writers such as Johann Gottfried Herder, Adolf Bastian and Theodor Waitz. The psyche of man, reacting to physical environments similar in their general features, expressed itself in a cultural development which was uniform, gradual and in the opinion of most evolutionists progressive. Uniformity here meant that culture everywhere evolved in essentially similar ways and passed through analogous or identical stages—the so-called parallelism in development. By gradual the evolutionists meant that cultural changes were slight and cumulative like the imperceptible gradations of the Darwinian biologists. The cultural changes were held to be progressive in so far as they led to higher forms, a belief which introduced an optimistic note into evolutionist thought for which Spencer was largely responsible.

The mode of procedure adopted by the evo-

lutionists came to be known as the comparative method. An inspection of evolutionary treatises such as Frazer's *Totemism and Exogamy*, Westermarck's *Origin and Development of the Moral Ideas* or even Briffault's recent *The Mothers* reveals bibliographies of extraordinary length reflecting the evolutionist's practise of scanning innumerable sources for illustrations of stages and substages. The evolutionists admitted that errors and inaccuracies were inevitable in view of the defective nature of much of this source material, but they expressed the complacent faith that the errors would cancel out and that thus the very mass of the data assured the fundamental correctness of the resulting picture.

Associated with the comparative method was the use of the concept of survival, a term introduced by Tylor. The evolutionists believed that as culture changes separate cultural elements are not always wholly obliterated but that some survive in a transformed or attenuated form, such as the games of children, which originally functioned as magical rites, or the complex of ideas and practises associated with the mother's brother which, the evolutionists held, belonged to the stage of maternal descent but were frequently encountered in the succeeding stage of father right. Survivals were utilized by the evolutionists as a proof of their contentions about stages in culture.

The determinism implied in evolutionist thought brought to the fore the problem of origins, particularly of first origins. If development was fixed, origins were not casual, and first origins gained prestige as nuclei pregnant with all that was to follow. The evolutionists became tireless origin hunters. Numerous origins of religion, totemism, the state, of particular technical devices, the dance, forms of address and etiquette, were invented and discussed with enthusiasm. The idea of evolution brought animation and imagination to the field of social thought. Many welcomed a philosophy of history which stood for broad perspectives, logical coherence and finality; others eagerly reaped the rich harvest of new facts, interesting and exciting in themselves, and accepted without too much probing the curious answers to many particular puzzles, such as the origin of Christmas, marriage or the art of making fire. The alliance of social thought with the older and more firmly rooted science of biology brought a sense of security and enhanced prestige.

The triumphal phase of evolutionism was, however, of short duration. With the accumu-

lation of adequate anthropological material the concept of uniformity and of stages was shaken and then collapsed altogether. In social organization, for example, it was shown by Starcke, Westermarck and anthropologists in the United States that the individual family was the one ubiquitous social unit, the most primitive as well as the most persistent. Telling arguments were advanced to the effect that neither the clan nor the gens had rightful claims to universality, that gentes were but seldom preceded by clans and that the notion of a primal matriarchate, in particular, had no factual basis, inasmuch as the socio-political preeminence of women was exceedingly rare in primitive societies still surviving and no convincing arguments in favor of its previous existence had been advanced by the evolutionists. Eduard Hahn and his followers attacked the dogma of the three stages in economics and succeeded in showing that wherever man was a hunter women gathered wild plants; that a pastoral stage did not necessarily follow hunting for there were agricultural tribes in North America and elsewhere who had never known domestication; that the agricultural stage, finally, required an analytical restatement, since two forms of agriculture were to be distinguished which were very different in their cultural status. These were primitive agriculture without domestication, with the hoe as its only tool and mostly practised by women; and historic agriculture with domestication and the use of the plow, practised by the male, whose labors as tiller of the soil were shared by the domesticated cattle and later the horse. The belief in the universality of primitive communisms was forced to give way before the proofs that certain types of personal property were everywhere individually owned and that among some hunting peoples there existed private territorial ownership. In religion animism and magic have been found to be equally primitive, while ancestor worship is recognized as a feature of more advanced rather than most primitive conditions and totemism has been redefined on the basis of fuller data. In art it has been shown that in a number of instances geometrical art does not arise from realistic art but has independent primitive origins.

Other attacks came from among the evolutionists themselves. Karl Marx, who in his youth had absorbed Hegel's dialectic trilogy—thesis, antithesis, synthesis—supplemented the concept of gradual change with the concept of

cataclysm or revolutionary change, an ideological reconstruction which with Peter Kropotkin, the communist anarchist, took the form of "evolution through revolution" and which also had practical consequences of vast significance. Anthropologists, on their side, were able to show that relatively sudden as well as vast changes, for example in religion, were by no means unknown even in primitive society and that similar revolutions were at least probable in early industry. This theory of cataclysm in social evolution can in no way be derived from the parallel shift in biological theory, which came a generation later.

The evolutionist conception of progress prevailed for a long time, but with accumulation of evidence it was recognized that regression was as common in history as progress and that culture, moreover, seldom advanced in all its parts. The rise of Greek civilization, which culminated in the Periclean age and during which architecture, drama, philosophy, the writing of history and the theory of politics advanced simultaneously, was declared to be unique; partial or one-sided progress was found to be the rule. The notion of progress, furthermore, implied judgments as to what constituted improvements, and no such judgments could be made without standards, which are notoriously subjective. The idea of progress was thus relegated from the domain of fact to that of opinion.

The psychological postulates of the evolutionists were attacked by Wilhelm Wundt, German psychologist, who in his *Völkerpsychologie* undertook an independent analysis of the phenomena of language, art, religion, myth, social organization, law and history. Wundt criticized the intellectualism and individualism of the evolutionists and pointed out that the conclusions of most people were not the result of rational analysis but of intuitively creative mental acts, or "apperceptions." He insisted that culture could not be understood without taking account of the formative and cooperative functioning of the group, whereas the evolutionists while doubtless aware of the existence of group phenomena had analyzed cultural facts as if they had sprung up in a social void populated by discrete individuals.

Anthropologists also criticized the evolutionists for treating separate tribes or tribal groups as if their culture had developed in a geographical void. Aware of the inner forces which were shaping culture, the evolutionists neglected the

outer forces engendered in intertribal contact. When later anthropologists took cognizance of historico-geographical settings of culture and studied intensively particular tribes, tribal groups and culture areas in relation to their neighbors, unforeseen complexities emerged. The part played by borrowed elements in the building of culture was recognized and evolutionary ideology inevitably appeared as an unjustifiable simplification. When the evolutionists had encountered cultural similarities in different tribes they had unhesitatingly referred these to parallel developments from similar or identical origins. But if diffusion was actual, cultural similarities might also be due to a remote common origin or to direct borrowing among the tribes. Thus a series of investigations and disputes was initiated the end of which has not yet been reached. The problem of diffusion as against independent development in fact antedates evolutionism. Adolf Bastian had already distinguished both factors, without, however, recognizing the attendant difficulties in the interpretation of similarities. Friedrich Ratzel initiated a series of studies dealing with the geographical distribution of single cultural features and unwittingly became the forerunner of the modern diffusionists. Not all evolutionists had ignored the problem or lightly brushed it aside. Tylor, in particular, in his *Researches into the Early History of Mankind* (1865) had discussed diffusion with insight and acumen. A shift from a critical examination of culture borrowing to doctrinal diffusionism is seen in the works of F. Graebner and G. Elliot Smith.

The practise of interpreting cultural similarities as parallel developments was also put in question by the doctrine of convergence. This concept, first used in ethnology by Paul Ehrenreich in 1903, was further elaborated and illustrated by Franz Boas, Robert H. Lowie and Alexander Goldenweiser. Cultural similarities were shown to have developed or converged in two or more places out of conditions or features originally dissimilar or less similar. Parallelism was no longer the only alternative explanation to diffusion wherever cultural similarities were to be accounted for.

The evolutionists were taken to task for the use they made of the comparative method. The validity of this method when rightly employed and its enormous significance for science were granted, but it was pointed out that no proof could be furnished for such a dynamic generalization as evolution by an arrangement

of static instances. For such precisely were the elaborate proofs of the evolutionists; they had gathered separate cases from many different tribes and places and had then attempted to piece these together into a quasi-historical series which was to represent a development. Disregard of historical and geographical factors is feasible when the uniformity of cultural developments is accepted as a postulate, but if this is granted the case for evolution is prejudged (for an elaboration of this criticism see A. Goldenweiser's *Early Civilization*, p. 20-27).

Of all social scientists the historians proved most nearly immune to evolutionism, for they knew the facts. They were accustomed to deal with series of successive events, and as their experience did not tally with evolutionism, they proceeded for the most part to ignore it. Had the evolutionists been historians rather than amateur anthropologists, the classical theory of social evolution would probably not have progressed beyond its early phases. When Karl Lamprecht wrote his *Deutsche Geschichte* (13 vols., Berlin 1891-1908), in which he attempted to fit his data into an abstract scheme of development, most historians were not receptive. The same fate befell Kurt Breysig with his *Die Geschichte der Menschheit* (Berlin 1907). When Oswald Spengler published his *Der Untergang des Abendlandes* (2 vols., Munich 1918-22; tr. by C. F. Atkinson as *The Decline of the West*, New York 1926-28), in which he revived the cyclical form of evolutionism, the popular success of this pessimistic work did not extend to his professional colleagues, who preferred to regard the book as ponderous journalistic propaganda.

Whatever its merits or demerits the ideological heritage which evolutionism has left to posterity is impressive. The tradition of the psychic unity of man which the evolutionists carried on has now become the common postulate of all but a few anthropologists and of the majority if not of all of the other social scientists. The evolutionist's wholesome respect for man's inherent creativeness is now shared by most social theorists, psychologists and progressive educationists, while the diffusionists, who reject this faith, find their skepticism a double edged sword. While denying the dogmas of the evolutionists modern social science carries on their search for causes and effects in the historic process. If prediction here is dubious and analysis necessarily subjective, it is due to the emphasis on individual events which

is a characteristic of all historic inquiry. The evolutionists, finally, have taught us to evaluate historic events, to know that not all past events are history but only those that carry over into the future.

Since the World War students of the social sciences without aiming at the logical orderliness of evolutionary schemes have renewed their search for relatively stable tendencies and regularities in history and society. On the other hand, the growing discrepancy between ideals and the workings of history is guiding the sciences of society into more and more pragmatic channels. If there is social evolution, whatever it may be, it is no longer accepted as a process to be contemplated but as a task to be achieved by deliberate and concerted human effort.

EWERS, JOHANN PHILIPP GUSTAV VON (1781-1830), German historian of Russian law and institutions. Ewers was born in Westphalia and studied with Heeren and Schlözer at the University of Göttingen. In 1803 he went to Livonia and from 1810 until his death was professor at the University of Dorpat. His first important work, *Vom Ursprung des russischen Staats* (Riga 1808), set forth the now discredited theory that the Varangians were not of Scandinavian origin but were Chazars who came from the region of the Black Sea. The work which made Ewers famous and gives him an important place in Russian historiography is his *Das älteste Recht der Russen in seiner geschichtlichen Entwicklung* (Dorpat 1826). This book marks the beginning of the scientific investigation of early Russian law and social organization and is the first work to propound the theory, later developed by Solovyev and Kavelin, of the clan origin of the Russian state. According to Ewers the clan was the oldest social organization in Russia. Strife among the clans forced them to choose as ruler an outsider, who governed the entire country in the same fashion as a patriarch ruled over a clan. The Russian state thus in its primitive condition was nothing less than a union of many clans. The chieftdom and property were not transmitted from father to son but were inherited by the brothers who held them jointly. While this theory has been refuted it is important in Russian historiography as the first attempt to offer a reasoned explanation of early Russian history.

E. SMURLO

EXCESS CONDEMNATION is the practise of taking by public authority under the right of eminent domain more land than is actually needed for a contemplated public improvement, with a view to selling the excess when the improvement is finished. It is thus an extension of the power to take private property for a public purpose on payment of just compensation.

The right of eminent domain in its usual exercise is limited to the condemnation of such land as is required for actual public use. Aesthetic and economic reasons, however, may sometimes make it highly desirable to secure in connection with a public improvement more land than is needed for the immediate purpose. The aim may be to facilitate good city planning by providing environmental safeguards for public improvements. For example, when a site for a new city hall is being acquired in a congested district it is usually deemed expedient for the

municipality to acquire control of the area immediately surrounding this site in order that the new structure may have a favorable setting. This purpose is accomplished by reselling the excess land under suitable building restrictions. A more common illustration occurs in connection with the widening of a city street. If no more land is taken than is actually required for the broadened thoroughfare, there may be left on both sides various remnants which by reason of their inadequate size and awkward shape are usually unsuitable for the erection of attractive buildings unless they can be consolidated. Such consolidation is often difficult if the property belongs to several private owners. By excess condemnation a municipality is enabled to acquire the whole tract and then to reparcel the excess land in a way that will insure satisfactory rebuilding on both sides of the highway.

Excess condemnation also sometimes permits the municipality to recoup itself for expenditures involved in a public improvement to a greater extent than would be possible through the levy of special assessments on the benefited property. The constitutional provisions and laws relating to the levy of special assessments usually limit the proportion of the enhanced value which the municipality may recover in this way, whereas by the process of excess condemnation the public gets all of the increase in value traceable to the improvement. Thus any profit resulting from betterments financed out of public funds is socialized and accrues to the community as a whole. Too much emphasis, however, should not be placed upon this aspect of excess condemnation, for the amount of recoupment obtained by the public authorities is usually below their expectations. This results from the fact that the acquisition of land by right of eminent domain is frequently an expensive process involving litigation and from the further fact that the completion of public improvement is often delayed, with a consequent holding of the excess land for a considerable period while the carrying charges mount up. Moreover, it sometimes happens that political influences intervene to procure the disposal of the replotted building lots to favored purchasers or lessees at figures which are not solely determined by considerations of public interest.

Both the theory and the practise of excess condemnation originated in Europe. The plan has found favor in German and English cities especially and has been used by them to a considerable extent during the past thirty years. In

London, for example, the Kingsway project included the excess condemnation of a wide swath on both sides of the new thoroughfare. But in the United States the proposal to utilize this method encountered at the outset a serious obstacle in constitutional provisions which restrict the right of eminent domain to the taking of private property for public use and do not permit its condemnation for resale into private hands. Such restrictions exist in most of the state constitutions; and although the courts have been fairly liberal in their interpretation of the term public use and have given municipalities the benefit of any doubt in this connection, it was not to be expected that they would go so far as the employment of the excess condemnation procedure required. In many cases an amendment to the state constitution was necessary before the plan could be utilized. Such amendments have been made in various states, including New York, Massachusetts, Ohio and Wisconsin. In other states, because of the greater flexibility of the constitutional provisions, the end has been achieved by the enactment of general statutes permitting municipalities to condemn excess land under certain restrictions.

With constitutional and legal barriers thus removed in various states, it seemed that American municipalities would make free use of the new method. For a time there was some disposition to do so; but the early experiments did not prove altogether satisfactory and in recent years the plan has not been used to the extent that was anticipated. Many municipalities throughout the United States have found that the plan of recoupment by the levy of special assessments when it is effectively worked out can be made to secure most of the financial advantages which accrue from the use of excess condemnation, while avoiding the danger of serious losses through political manipulation. Excess condemnation is consequently being used for the most part only in cases where the aesthetic protection of public improvements is an important consideration.

EXCESS PROFITS TAX. As early as 1863 in order to provide war pensions the state of Georgia imposed an excess profits tax on the earnings of corporations in excess of 8 percent of the capital stock at rates varying from 5 percent to 25 percent of the amount of such excess. This tax was quite productive, but the law was soon repealed and the experiment was forgotten. The excess profits tax developed anew during the World War as a logical result of the great public need for increased tax revenue and the widespread feeling that it was unjust for business to profit greatly by war when men were dying by thousands in the trenches. The tax was first confined to specified industries, such as the manufacture of munitions, or in neutral countries to companies profiting directly by special war trade with the belligerents; but in 1915 the tax was expanded to cover war excess profits in general in the United Kingdom and the Scandinavian countries, and thereafter it spread rapidly to the British Empire, Austria, France, Germany, Greece, Hungary, Italy, Japan, the Netherlands, Russia, Spain, Switzerland, the United States and other countries.

The principal object of most of these taxes was to tax heavily the excess of wartime profits over pre-war profits. Thus in Great Britain in 1917-18 a tax of 80 percent was imposed upon the excess of current profits over the "pre-war standard," defined as the average profits of any two of the last three pre-war years to be selected by the taxpayer. Where pre-war profits were abnormally low the taxpayer could substitute a "percentage standard," 6 percent or in the case of non-corporate business concerns 8 percent of the capital invested at the end of the last pre-war year. In practically all cases the allowance for changes in capital had to be made on a percentage basis: for increase in capital during the taxable year at the rate of 9 percent (non-corporate business, 11 percent); for decrease in capital during the taxable year at the rate of 6 percent (non-corporate business, 8 percent). In the case of new business concerns the pre-war standard was calculated as 9 percent of the capital invested (non-corporate business, 11 percent). There was a specific deduction or credit of £200 increased in the case of small concerns by one fifth of the amount by which the profits were less than £2000. After the year 1918 the rate of the tax was reduced and the amount of deduction to small concerns was raised.

In other countries—notably Canada and the United States—only minor attention was paid to

the profits of pre-war years. Excess profits in these countries meant excess over "normal" profits, which were measured as a percentage of capital invested in the business. This basis was deliberately adopted in the United States against strong opposition in order that businesses which were exceptionally prosperous both before and during the war should not be exempt from the tax by reason of their pre-war prosperity and in order that the tax might be permanently retained if it proved successful. In one year (1918), however, the United States imposed an excess and war profits tax by which the taxpayer paid progressive rates of 30 percent and 65 percent upon excess profits or 80 percent upon war profits, whichever amount was the larger.

The tax was generally administered by the regular income tax officials, supplemented in most countries by a special board invested with unusual discretionary powers. In general it was confined to business profits, exempting wage earners, professional men and the rentier class. Austria, Denmark, Germany and Italy, however, laid taxes on income other than profits, and the American tax for the single year 1917 applied not only to all forms of business but to professions and occupations employing "no invested capital or not more than a nominal capital"; the tax on the latter being 8 percent of the net income in excess of \$6000. After 1917 the American tax applied only to corporations other than "personal service corporations," i.e. those in which capital was "not a material income-producing factor."

With minor modifications designed to temper the rate to small corporations and to relieve cases of excessive hardship the American tax in general applied to profit in excess of a normal deduction or "excess profits credit" consisting of a specific exemption of \$3000, plus 8 percent of the invested capital. Upon such excess profits the rate upon corporations for the year 1917 progressed from 20 percent on profits not in excess of 15 percent of the invested capital to 60 percent on profits in excess of 33 percent of the invested capital. In 1918 the rate was 30 percent on excess profits not exceeding 20 percent of the invested capital plus 65 percent on excess profits exceeding 20 percent of the invested capital or, as stated above, 80 percent upon war profits if greater than the tax on excess profits. After 1918 the rate was 20 percent on excess profits not in excess of 20 percent of the invested capital, and 40 percent upon the remaining profits, if any.

Invested capital was computed on a historical or cost basis. It included cash paid in for shares, paid in or earned surplus and undivided profits (not including surplus and undivided profits earned during the year) but excluded borrowed capital and any assets (such as corporate shares) the income from which was not included in computing taxable profit. Assets were valued at original cost, revised by the appreciation or depletion allowed. If not acquired by purchase they were taken at their actual cash value at the time of acquisition, but rigid limitations were imposed upon the value of good will and other intangible assets paid in for stock or shares. Any writing up of assets through revaluation, reorganization after March 3, 1917, or otherwise was in general prohibited, and corporations which wrote up their assets and reorganized before this date secured an enormous advantage thereby.

As a war tax the excess profits tax in the United States was a striking success. Its yield exceeded budgetary estimates; it became the largest source of revenue apart from borrowings; during the three years 1917-19 the average yield of the tax was little short of two billion dollars and supplied more than one fourth of the entire ordinary receipts of the federal government. It was paid without excessive hardship, complaint or evasion owing to the patriotism of business men, the enormous profits which they enjoyed and the "cushions," or relief provisions, provided by the law and administrative regulations.

Later, as business profits fell off, the yield of the tax fell and taxpayers became much more critical in their interpretation of the law; refunds of enormous amounts were claimed and collected. In 1920 the complexities of the income and profits taxes were described by Secretary of the Treasury Houston as "clogging the administrative machinery and threatening, indeed, its possible breakdown." In times of peace the excess profits tax did not wear well. While efforts were made, particularly in Great Britain and the United States, to keep the excess profits tax permanently, the movement for repeal set in strongly during the year 1920, and by the close of 1921 the tax had been repealed in most of those countries in which it had proved successful.

In countries not badly disorganized by war, where public opinion supported the policy of paying war expenses so far as possible by war taxes, the excess profits tax was a success not only from the standpoint of yield but in supply-

ing an invaluable complement to price regulation and in allaying public indignation at the spectacle of private business profiting inordinately by war. It was widely charged in Great Britain and the United States that the excess profits tax was ordinarily shifted with additions to the consumer. Although it is true that many business men used the excess profits tax as an excuse for raising prices, there is no basis in price statistics for the belief that the excess profits tax was generally shifted to consumers. As an income tax and as a differential tax (not applicable to producers at low profit and in the United States after 1917 not applicable to partnerships or sole proprietors) both theory and experience are against the likelihood of general or important shifting of the burden of such a tax. The evidence is conclusive, however, that the excess profits tax greatly stimulated expenditures for building up good will by advertising or otherwise and the payment of bonuses to executives. Where, as in the United States, such expenditures could be deducted as current expense, business concerns could make such expenditures at a net cost to them of approximately 40 cents on the dollar when the tax rate was 60 percent.

In theory the excess profits tax on the American or Canadian basis has great merit as a permanent tax. It emphasizes the principle of ability to pay in business taxation, laying especially heavy taxes on extraordinary business success but sparing business undertakings in the developmental stage or whenever they are only moderately successful. It would prove a valuable supplement to rate regulation in such industries as steam transportation, where fair rates for the weaker railways may yield excessive profits to their stronger competitors.

As a peace tax it has failed in practise because of its complexity and the unfair discrimination among taxpayers and the excessive administrative burden created by this complexity; because the necessarily high rates of the tax have exaggerated all its defects; because in the long run it falls not so much upon supernormal profits as upon fluctuating profits and with special weight upon the hazardous industries, exempting the investor or business wealthy enough to accept a normal but safe and regular rate upon its invested capital; and because American experience indicates that invested capital cannot be successfully measured on the basis of original investment. With the passage of time the real significance and value of the capital of a business

changes radically according as it is successful or unsuccessful. If the excess profits tax is to succeed as a permanent tax, "excess or supernormal profits" must be measured in some other and better way than as a percentage of invested capital.

EXCHANGE in modern economic usage implies a mutual and voluntary transfer of property (including services) and a fundamental equivalence in the things exchanged, an equality in value which rests upon economic rationality and developed market institutions. In this sense exchange is the central concept of economic science, whether of the theoretical or empirical type, in so far as the exchange economy is the characteristic form of economic organization in the modern capitalistic world.

The modern economic organization, however, is not an exchange economy pure and simple; it is not based on the actual exchange of goods and services by their producers, directly or through the medium of money, which has been characteristic of an earlier and different stage of economic development, such as the town and guild life of western Europe in the Middle Ages. The existing economic system, which may be regarded as an outgrowth of the exchange economy, is more accurately described as an enterprise economy. Production in the active, responsible sense is now typically carried on by an abstract entity, the business unit, or enterprise, which is functionally distinct from the natural person or persons composing it. Enterprises and not individuals own the products of

economic activity, and these are not literally exchanged against each other either by enterprises or by individuals. Individuals and families get their livelihood through a twofold process of buying and selling which is not properly exchange, because the role of money in it is so important that it cannot be replaced by barter, as should be possible in the case of true exchange. The individual sells productive services to enterprises for money and buys with the money from enterprises the consumable goods and services which constitute his real income.

In some stage theories of economic development the earlier history of economic institutions has also been viewed from the standpoint of the evolution in scope and form of exchange taken in the broad sense. For example, Bruno Hildebrand's scheme, in which the medium of exchange is used as a criterion, provides for three main stages in economic development: the natural or barter economy, money economy and credit economy. Karl Bücher's still more famous scheme takes for the index of progress the increasing number of hands through which products pass between producer and consumer. Bücher also found three main stages: self-sufficient economy, producer and consumer identical; town economy production to order or direct sale; and national economy, production for a nation wide market. Later writers found it natural to add to this list a fourth stage, world economy.

Even from the standpoint of exchange itself these schemes disregard some of the most important developmental changes. Thus at the very beginnings of economic society the commodities exchanged must have been relatively inessential things, objects of adornment or implements and materials of a not indispensable sort, for a primitive group dependent upon other groups for prime necessities would be in a rather precarious position. Trade was under these conditions an "exchange of surpluses," a phrase which must be categorically avoided in application to the later times when goods have been produced expressly for exchange and exchange has become a part of production. Under advanced conditions exchange is an incident of specialization, and its significance is that of increasing the productiveness of labor and of other resources.

Again, division of labor through exchange developed first between distinct, even relatively distant, groups and became effective as between members of the same group much later. It is

difficult to prove any such general statement regarding prehistoric or primitive peoples, but it is certainly true of mediaeval European civilization that interlocal and overseas commerce achieved importance far in advance of local trade. The course of modern economic history has been largely one of development within the group of those "commercial" relations—the "cash nexus" and all that it implies—which previously obtained between groups or between members of different groups. It would only be natural that exchange should develop first between peoples where because of differences in natural resources or culture traits notably divergent and hence especially attractive articles were found. If exchange in any sense takes place between members of the same primitive group it is a ritualistic or gift exchange, which does not mediate productive specialization. Its motive is good will or ostentation, not economic efficiency, and its control is ritualistic and customary, not rational-economic. Economic relations within the group are communistic, based on tradition and authority.

Finally, in primitive trade the parties are the groups as such rather than individuals; exchange is likely to be carried on by the groups in a body or by the chiefs or their agents. Yet it is also a very general phenomenon at some stage for the actual conduct of the trade to be in the hands of a special caste within the tribal society or of a separate ethnic group specialized to the function. Even in mediaeval Europe this position is approximated by the "Syrians," Jews and later Lombards and Cahorsins in the north, who were more or less outlaws as well as aliens. These trading castes or nations universally manifest a peculiarly individualistic psychology as compared with the family or clan or corporate attitude of the fixed populations among whom they move. Later commerce furnishes the drive to break up the fixity of old forms and create the spirit of progress and the modern world order; it has been largely responsible for the development of the individualistic outlook on life characteristic of the modern west, including the sentiment of liberty in that individualistic sense which is largely antithetical to political liberty historically understood, although the modern citizen tends to identify the two.

Although commerce dominated industry not only in the Middle Ages but also in the following centuries of Renaissance and mercantilism, this domination is not characteristic of fully developed capitalism. In current economic life it is

not acquisitiveness but a form of the creative impulse which dominates and gives the tone. It is a rather childish form, well expressed in the slogan "bigger and better" as generally used and understood; but still it stands for constructive activity and not "greed of gain" in anything like the sense characteristic of the mediaeval and early capitalist or oriental trade.

Many institutions of primitive trade, such as the "silent trade" and "armed market," its generally ritualistic character and the universal ethical antipathy to the trader seemed to early students to prove that the general relationship between primitive groups was one of hostility or armed truce and that trade must have grown out of war and plunder. But later study has given more emphasis to the guest gift and other peaceful origins against a background of friendly social intercourse and even travel. The details of the development of price fixing are especially obscure. Those who hold to the hostility theory of primitive relations contend that as trade differentiated itself from robbery the prices were fixed by a mixture of force and deception. Under a peaceful sociability theory they would be a matter of the purchase of good will and competitive ostentation. The later history of price would in either case be one of alternation between periods of standardization and of the breakdown of standards by sudden or accumulating change, with chaotic higgling gradually settling to new standards. In any case, the idea of competitive price is very modern, equally antithetical as it is to a price fixed by law or custom and to higgling. And the notion of price fixed by conditions of production or in terms of division of labor, as contrasted with competitive relations between immediate sellers and buyers, is still very imperfectly grasped.

The conception of a system of prices, of products and of productive goods and services guiding the choices of individuals in the various economic relations and implementing an "automatic" control of production and distribution as a whole, more or less in the interest of all, is the creation of modern economic theory, which in turn is the product of the growth of free enterprise itself. In the period of the Renaissance the ethical, disciplinary, spiritual-perfectionist mediaeval world view was replaced by a conception of life in terms of desire and satisfaction and the intelligent use of means, but the immediate result was a struggle for power between the new national states. It was the later controversy over state control of foreign com-

merce which gave rise to the modern doctrine of individual economic liberty or *laissez faire*. The balance-of-bargain theory was displaced by the broader one of the balance of trade, which actually worked toward liberation, until free trade came to be openly espoused and theoretically defended. The doctrine of economic freedom was also a by-product of the disintegration of the internal regulatory system of the national states, which at the Renaissance replaced that of the church, the towns and the guilds. When in 1776 Adam Smith published his epoch making *Wealth of Nations*, economic conditions as well as political controversy had prepared the minds of educated men to listen to an argument for "economic liberty" not merely in the narrow field of exchange or commerce, but in the broad and vastly more important one of enterprise, including the purchase and sale, borrowing, leasing and hiring of the material and human means of carrying on production. Thus arose the so-called classical, or orthodox, economic theory, which views economics as a pure "mechanics of exchange" or, more accurately, of free enterprise. Its practical mission has been to educate governments and the public regarding the mutuality of interest and of benefit in market dealings and their productiveness as against the primitive feeling that trade is robbery and chicanery or at best waste. Its intellectual task has been to explain the organization of production and distribution under the influence of intelligent price competition in the two markets in which business enterprises buy productive services and sell products. It has also attempted to explain social growth under the private profit incentive to save and invest, explore, invent and improve; but the notion of rational reaction to price data is much more vague and uncertain here.

More recently it has become clear that the "exchange mechanics" type of economic theory is subject to several fundamental limitations. Its explanation of economic phenomena runs in terms of perfectly abstract wants or needs, available resources and methods of using the resources. It deals merely with the maximizing of wholly unspecified satisfactions under wholly unspecified "given conditions" and is not interested in what actually happens, not even in the distribution of consumption or of economic power in the system as it works toward equilibrium. Its assumption that economic rationality is the general form and tendency of individual behavior and in any case the ideal toward which

it should be directed is becoming increasingly difficult of acceptance. It overlooks the new social stratification based on wealth and the modifications introduced thereby in the exchange relations in the market for products and particularly in the market for productive services. These considerations do not impair the value or necessity of a mechanics of exchange as long as civilization regards satisfaction of individual wants and individual liberty and intelligence as good. But the reaction against it which has developed in economic science is to be welcomed in so far as it leads to more knowledge of the content and workings of economic conditions and forces. In the historical study directed to the securing of such knowledge the nature, condition and meaning of exchange must constitute the central and guiding idea.

EXCISE is a tax on commodities of domestic manufacture levied either at some stage of production or before the sale to home consumers. The excise is an indirect consumption tax and is generally supplemented by the customs duty, the tax on imported commodities. Other means of indirectly taxing the consumer are a transportation tax, a turnover or sales tax and under certain conditions monopolization by the state of the production or distribution or both of specified commodities. The term excise has been extended to cover license duties required of producers and dealers in excisable articles as well as those paid for permission to practise or follow certain sports, trades or occupations. In the

United States excise taxes are usually referred to as internal revenue taxes.

Excise taxes were introduced at the close of the Middle Ages, primarily in order to provide a reliable and steady flow of revenue to meet the mounting indebtedness of the states. But they soon acquired a political significance in that they afforded to the royal power and rising commercial class a convenient means of shifting a part of the tax burden to the privileged clergy and nobility who could not be reached by direct taxation. Originally levied on certain commodities of widespread consumption like beer, meat and flour, the excise duties were extended in the course of time to include an increasing number of commodities and developed into the general excise tax levied on virtually all articles of consumption. In the Netherlands the struggles for freedom from the Spanish, in England the struggle between Parliament and Charles I, in Saxony the burdens of the Thirty Years' War, led to imposition of excise duties and eventually to the general excise; in Prussia the latter was introduced under the Great Elector. Toward the end of the seventeenth century the excise taxes assumed decidedly oppressive forms; complaints about them were particularly loud in eighteenth century England, where scarcely any article of importance was left untaxed. With the democratization of political control in the nineteenth century and the consequent shift of emphasis in taxation from consumption to property and income the excise taxes have been gradually deposed from their commanding position.

Excise taxes in the United States have been levied by both the federal government and the states, although the federal constitution prohibits state taxation of commodities entering interstate commerce. Federal excise taxes were first levied under Hamilton's administration as a means of providing revenue to meet debt charges. They aroused considerable hostility and were repealed in 1802. The experiment was repeated for a wider range of commodities during the War of 1812, but all internal taxes were repealed in 1817. During the Civil War the excise was used on a larger scale than ever before; a series of specific and ad valorem taxes was levied on all manufactured products and license taxes were imposed on trades. In the three years following 1862 the tax rates were raised several times; but after 1865 the system was gradually contracted, until by 1883 only the tax on liquors and tobacco was retained. The rates on these commodities were raised and the tax extended to a number of

other articles during the Spanish American War. In 1914 excise taxes were again resorted to as a war measure, but the most objectionable of them were abolished by 1928. The outstanding examples of state excise duties are the gasoline tax (*q.v.*) and the tax on tobacco and tobacco products.

At present excise taxes in all countries are confined to a few commodities. The taxes on such commodities of mass consumption with a fairly inelastic demand as alcoholic beverages and beer (*see LIQUOR TRAFFIC*), sugar (*q.v.*), salt (*q.v.*) and tobacco (*q.v.*) are the most important and most frequently used. Their purpose is primarily fiscal, although in the case of liquor and tobacco they are intended in part as a means of sumptuary control. Excise still supplies about one fourth of the ordinary revenue of the United States and Great Britain; it is of considerable significance in France and of some importance in Germany. After the World War the enormous growth of the budgetary requirements of many European countries led them to place an increasing reliance upon the excise in order to mitigate to some extent the oppressiveness of property and income taxation.

The excise tax may be levied on the raw material or the finished article or it may attach to an intermediate stage of the production process. When it is imposed on the raw material it is proportioned either to the area under cultivation or to the quantity of the raw material as measured by weight or by the size of the container. Since taxable capacity is determined in the last resort by the finished product, the legislator must in determining the tax rate take account of the average raw material content of a unit of the finished product. As the relationship between the raw material and the finished goods is subject to variation, a tax on the raw material stimulates the manufacturers to perfect the processes of production in order to increase the yield per unit of raw material and thus to escape a part of the tax burden. The beet sugar, beer brewing and liquor industries have made remarkable progress in this respect by selecting raw material rich in the ingredients desired as well as by improving the refining processes. On the other hand, a raw material tax is disadvantageous to producers inasmuch as it is collected at the very beginning of the production process, long before the manufacturer has the opportunity to recover it by selling the finished product. This disadvantage is sometimes remedied by the government through the grant of tax credits calcu-

lated to run for the average duration of the production process. The manufacturer may also resort to storing the goods in bonded warehouses, thus postponing the payment of the tax until the commodities are withdrawn for sale. If the finished product is exported the raw material tax is refunded; as this refund is based upon the legally prescribed relationship between the raw material and the finished product, the more efficient producer receives back a larger amount than he really paid. Such refunds constitute a drain on the treasury and have the effect of a premium on export at the expense of the general taxpayer.

When the tax is applied at an intermediate stage of production or on the finished product, the period for which the tax is advanced by the manufacturer is considerably shortened. These forms of taxation have the further advantage of enabling the legislator to take into account differences in quality, so that commodities of greater value may be subjected to higher tax rates. This is quite simple in case of finished products and is also practicable wherever it is possible to ascertain the specific contents of intermediate products, e.g. the sugar content of beet juice with the help of the saccharometer. Taxation of intermediate or finished products often involves a close supervision of the production process by the revenue authorities and may therefore prove too costly to the government and too burdensome to the manufacturer.

License duties are a peculiar relic of older conditions; they occupy an intermediate place between the taxes on industrial occupations and taxes on consumption. License taxes have been widely adopted in England, France, the United States and other countries. Besides the license fees proper, consisting of fixed annual amounts, there are license duties graduated according to the quantity of excisable goods manufactured or handled by the holder of the license. Such licenses are often used as an aid in the effective administration of the excise.

The effect of the excise on the price of the commodity taxed depends upon the conditions under which the commodity is produced. If the industry is one of increasing returns and the demand is not absolutely inelastic, the price is likely to be increased by an amount greater than the tax; the reverse is true for an industry of diminishing returns. Where the article is a standard product with a nationally advertised retail price, a low rate tax is quite likely to have no effect on price; that is, it may be absorbed by the producer or distributor. The effect of price changes

caused by the imposition of a tax on consumption is determined by the elasticity of demand for the commodity in question. Where the commodity can be easily dispensed with, the consumer is in a position to avoid a part or the whole of the tax burden without doing injury to himself. Even in the case of necessities a curtailment of consumption may occur but only at the expense of injury to the health or the general welfare of the consumer. The great mass of the population, however, will not resist the tax increase on necessities even when it amounts to a considerable addition to the tax burden and will compensate by economizing on less imperative needs. Hence the taxes on necessities offer, particularly in times of great financial stress, a welcome but often abused means of considerably increasing the public revenue. At present consumption taxes yield a large amount of revenue even after the considerable costs of their collection and administration are deducted; this is due to the fact that they apply preeminently to commodities of mass consumption.

Excises like all consumption taxes seek to distribute the burden of taxation in proportion to the consumption of goods and services. They are apparently based on the assumption that the volume of consumption bears a definite relationship to the income of the individual and thus reflects his ability to pay. Attempts to introduce the principle of progression by graduating the tax rates according to the quality of the product are of rather limited application. In so far as this principle is applied to differentiate between business concerns in accordance with the size of the enterprise or quantity of output it may serve to protect the smaller concerns from the strangling competition of technically and economically superior large scale industry. Such measures, however, partake of the nature of instrumentalities of domestic economic policy and cease to be purely fiscal devices.

Consumption taxes are often unfavorably contrasted with income and property taxes. It is justly pointed out that consumption taxes are regressive in that they impose a relatively higher burden upon the income of the poorer classes of the population, because the latter's expenditures on necessities absorb a much higher proportion of income than in the case of the middle or upper class families. It is overlooked, however, that even the poorer taxpayers may succeed in shifting the tax to the employers or the community in general. Thus recent experience indicates that a considerable increase in consumption taxes

gives rise almost automatically to a demand of organized employees for higher wages and salaries. The significance of consumption taxes can be rightly understood only when they are considered as a constituent part of the whole system of taxation. They form a certain counterpart and important supplement to progressive taxation of income and property, when the latter is no longer capable of supplying sufficient revenue for the needs of modern states. The more heavily the burden of taxation is laid upon income and property and the more rigorous the progressive graduation, the more necessary and unavoidable becomes the imposition of indirect taxes on consumption.

EXCOMMUNICATION in one or another of the several different meanings of the term has always and in all civilizations been one of the principal means of maintaining discipline within religious organizations and hence of preserving and strengthening their solidarity. In the sense of expulsion from the religious community excommunication was the earliest punishment inflicted by the Christian church upon its members and, although in the course of time its original character was altered, it has always remained the foundation of the criminal law of the church. A Greek parallel to excommunication by the Christian church may be found in the exclusion from purification with holy water of a person whose hands had been defiled by bloodshed; while it may also be noted that the Druids claimed the power to exclude offenders from sacrifice. Similarly according to primitive Semitic customs restrictions were imposed on contact with persons placed under ban and those

who infringed such restrictions were subject to supernatural dangers; moreover, impious sinners might be devoted to complete destruction. Hebrew custom illustrates the fact that in a theocracy excommunication is both a religious and a civil punishment, and indeed among the Hebrews as in Greece and Rome whole cities or nations could be devoted to destruction by the pronouncement of a ban. The ordinary form of Hebraic religious discipline was, however, the temporary separation or seclusion that was prescribed for ceremonial uncleanness. Spinoza's excommunication for contempt of the law is a modern instance of Hebrew practise.

In secular law one of the closest parallels to excommunication in the sense of expulsion from the religious community is outlawry. In early law outlawry meant expulsion from the community for the most serious breaches of the law; it involved, in fact, the death sentence. In the early Middle Ages in Germany excommunication was regarded as ecclesiastical outlawry, and both in their origin and in their later development there are many points of similarity between outlawry in secular and excommunication in ecclesiastical law. Certain of the minor punishments of early secular law, such as exile, reduction to slavery, abjuration of the realm, removal from villages and towns and the loss of civil and political rights, some of which penalties were derivatives from outlawry in its earlier or later forms, may also be compared with excommunication in one or another of its several meanings.

In the disciplinary and criminal system of the Christian church, as ultimately embodied in the developed canon law, a distinction was drawn between *poenae medicinales* and *poenae vindictivae*. The former were censures which had as their main purpose the reclamation of the sinner, while the latter, which were based on the idea of retribution or retaliation, were punishments intentionally directed to the suffering of a hurt on the part of the sinner. *Excommunicatio* and the closely related forms of punishment, *suspensio*, which came into use early in the fourth century, and *interdictum*, which developed in the tenth, were the *poenae medicinales*; and, while these three forms of censure aimed chiefly at effecting the reclamation of the sinner by *absolutio* after penance, they also involved an element of the purpose underlying the *poenae vindictivae*, such as physical chastisement and imprisonment.

In the history of excommunication the centuries before the Carolingian age are of special

interest as the period of origins and early development. The earliest Christian churches, religious communities inspired by the ideal of realizing the kingdom of God on earth, surrounded by heathendom and without the support of the Roman imperial authority, which was either hostile or tolerant, were obliged to depend upon themselves for the preservation of their own existence and welfare. As one of the most essential of all measures for the attainment of this purpose the primitive Christian associations exercised a disciplinary power over their own members; in its most severe form discipline consisted, even as early as the apostolic period, in expulsion or exclusion from the association of those members who proved to be unworthy of its aims or infringed its rules of governance. In general, criminal and disciplinary power, including the power to exclude, resided in each individual community without reference to any higher ecclesiastical authority.

In the postapostolic period before the time of Constantine the spread of Christianity and the development of a Catholic episcopate resulted in a modification of this primitive form of expulsion or exclusion. The conception that the church was a unification of all Christian communities under the episcopate and that communion with Christ was conditioned by communication with the church meant that exclusion from a particular community was not only an exclusion from the entire church but also an abolition of communion with God. The bishop, moreover, had acquired the leadership of the community; and in the exercise of criminal and disciplinary powers, including the power to exclude both clergy and laity alike from the community and the church, he was viewed not as the representative of the community, but as the instrument of Christ. The apostolic principle that members should be excluded only for the most serious sins was maintained; but, while in the apostolic age no sinner who repented and did penance was refused readmission to membership, a greater severity manifested itself in the second century, for not only was the one who had committed for the second time a serious sin refused a second readmission, but in the case of certain of the most serious sins, namely, idolatry, unchastity and murder, the first offense meant exclusion without any hope of readmission. In the case of an excluded member readmission to membership was conditioned on his public acknowledgment of the sin and his public penance. Penance was not viewed, however, as

the fulfilment of a duty owed by the sinner and a duty, moreover, which could and should be enforced by the church, for compulsion was foreign to the idea of true repentance for sin. The church, in fact, regarded penance as a benefit or favor accorded to the sinner; and, contrary to views that have sometimes been expressed, it was not therefore an ecclesiastical punishment or censure in the present day sense of that term. In accordance with the earliest ideas readmission to membership was the restitution of *pax*, but in the postapostolic centuries it was regarded from a different standpoint. The bishop decided whether the public penance of the sinner was adequate, and if he held that it was he readmitted the sinner to membership by the laying on of hands. Not only was penance, however, viewed as rendered to God, but the readmission of the repentant sinner was treated as His act. The excommunication had been an exclusion from the church and from communion with God; the readmission, an act performed by the bishop as Christ's representative, was no longer merely the community's forgiveness of the sin, but in accordance with the later conception a remission of sin by God Himself.

The recognition of the Christian church by the Roman Empire in the time of Constantine resulted in giving it a legal and privileged position; and accordingly the criminal and disciplinary system of the church, and, not least of all, that part of it which came to be known in later times as excommunication, entered upon a new stage of development. While adhering firmly to many of the basic principles of that system and preserving the established rules in regard to penance the church was obliged, largely as a result of the widening basis of membership, to modify some of the features of her law respecting crimes and discipline.

In the period from Constantine to the loss of the western provinces of the empire through Germanic conquest the church employed three principal kinds of punishment: exclusion from the ecclesiastical community, exclusion from the Lord's Supper and suspension of the rights of church membership. While these were primarily designed for lay members of the church they were also applicable to the clergy, for whom there were in addition certain special kinds of punishment, the severest of which was deposition. Exclusion from the ecclesiastical community took three different forms: exclusion forever and without the possibility of readmission; exclusion until the hour of death, representing a

certain softening of the older rigor; and exclusion without limitation as to time, under which the excluded sinner could be readmitted to membership as soon as he had performed the required penance, although in some cases he was in fact required to do penance within a fixed time as a condition of readmission. Exclusion from the ecclesiastical community in one or another of these three forms corresponded in general to that kind of excommunication which was known to later times as the major ban, or *excommunicatio major*. The excluded, or expelled, sinner was no longer a member of the church and he lost in consequence all his ecclesiastical rights, such as the right to take part in the Lord's Supper and the right to a church burial. While lay members of the church were merely forbidden to have any religious intercourse with the excluded sinner, the clergy were allowed to have no relations with him whatsoever; and if they broke this prohibition they themselves were subject to punishment by exclusion. The exclusion of a sinner operated not alone in respect of his local ecclesiastical community but removed him from the entire Christian church.

In addition a milder form of ban was sometimes employed in the period after Constantine. Possibly as early as the end of the fourth century, but certainly in the fifth, those members of the church who had committed certain of the lesser sins were sometimes excluded for an indefinite time from participation in the Lord's Supper and in divine services intended only for believers, until by penance they had gained a remission of their sins. This punishment, which did not result in the loss of membership in the church, corresponded to the minor ban, or *excommunicatio minor*, of later centuries. Exclusion from the Lord's Supper as a form of censure was not used by the pope before the end of the sixth century.

To be distinguished from this early form of the minor ban, although sometimes confused with it, was suspension of the rights of church membership. Like exclusion from the Lord's Supper suspension was used only in the case of the lesser ecclesiastical crimes and did not mean a loss of membership. But whereas only through his penance was the sinner who had been excluded from the Lord's Supper once more permitted to participate in it, in the case of the suspension of the rights of membership there was no need of penance on the part of the sinner; at the end of the period of suspension he

could at once exercise his rights. In this connection it may be observed that the Frankish and West Gothic councils mention an *excommunicatio* for short periods, such as for one, two or three years, two months and even three days. Apparently, the term *excommunicatio* when so used meant merely a suspension of the rights of ecclesiastical membership for a limited period, a form of punishment which had been inflicted ever since the early part of the fourth century.

The system of punishments and censures which the church had developed during the time of Roman imperial dominion was preserved in the Germanic kingdoms from the fifth century onward but was modified by many additions and changes. The major ban continued in use as the most important punishment of laymen and clergy alike, and for it the Latin word *excommunicatio* was used more frequently than in the Roman epoch. Excommunication continued to be described as exclusion, or expulsion, from the church with the resulting loss of membership, and it seems that the ecclesiastical authorities of the Germanic era did not fully realize that St. Augustine's theory of baptism made it theoretically difficult to deprive a person of his membership. St. Augustine taught that baptism impressed upon a person who had received it an indelible character; the natural consequence of this doctrine was the impossibility of completely detaching a person from the church once he had been admitted as a member. Moreover, whereas in late Roman times in the West a person who had completely lost his membership in the church preserved nevertheless his full freedom to live in the Roman Empire and suffered no diminution of his civil rights, the changed conditions of religious and political life in Merovingian times left the one who had been totally excluded from ecclesiastical membership with no place either in church or state. Unconsciously influenced by St. Augustine's doctrine and these altered conditions of life, the ecclesiastical authorities in administering the criminal law combined in a certain sense two of the older forms of punishments: exclusion from the ecclesiastical community and suspension of the rights of ecclesiastical membership. Not only did the church councils no longer prescribe the most severe form of exclusion, namely, exclusion for all time without the hope of readmission, but ecclesiastical authorities in inflicting punishments frequently employed the same language in reference both to total and perpetual exclusion and to the suspension of the

rights of membership for periods of time. Excommunication in the sense of the major ban thus came to have a new meaning in the Merovingian era; in general practise it was now limited to the temporary withdrawal, or suspension, of the rights of membership, which might be regained.

The canon law of the post-Gratian era gave added definition to the rules of excommunication; only those persons who had become by baptism members of the church were liable to have inflicted upon them the punishment of *excommunicatio*. Laity and clergy, with the exception of the pope, were alike subject to excommunication; the pope could under no circumstances be punished by excommunication (*papa a nemine judicatur*). A sharp distinction was drawn between two forms of *excommunicatio*: *excommunicatio minor* meant exclusion from the sacraments and in the case of the clergy the loss of eligibility for ecclesiastical office; *excommunicatio major*, although it did not result as formerly in the loss of membership in the church, had nevertheless as its effect the exclusion of the banned person from the community of believers, or, in other words, the dissolution of his ecclesiastical relations. As in the case of the minor ban the person banned under *excommunicatio major* was excluded from the sacraments and lost his eligibility for ecclesiastical office; but in addition he was not permitted to attend divine service (except to hear sermons), he became incapable of acquiring ecclesiastical benefices, he was deprived of his rights of *jurisdictio* and of suffrage, he suffered the loss of *communicatio forensis* (capacity to appear as witness, procurator or plaintiff), he lost the right to a church burial and in general he was excluded from all participation in the life of the church. In order to make the major ban more effective the church forbade all its members to associate with the excommunicated person. Those who infringed this prohibition were themselves liable to the punishment of *excommunicatio minor*, and in the later law the minor ban was employed on principle only in such cases. Papal decretals gradually effected a softening of the rigor of non-intercourse by the introduction of certain exceptions, a process which has been carried still further in recent times. Anathema in canon law is legally equivalent to *excommunicatio major*; since the appearance of the decretals of Gregory IX it has always meant *excommunicatio major* pronounced in an especially solemn and ceremonial form as a curse. Anathema is not a

punishment separate and distinct from *excommunication*.

The right to decree the punishment of excommunication depended and still depends upon the possession of *jurisdictio in foro externo*, but this right cannot be exercised in case the *judex* is himself an excommunicated person or in case his *jurisdictio* has been otherwise suspended (*suspensio ab officio*). Every bishop is competent to inflict excommunication upon the persons who are subject to his jurisdiction and excommunication by one bishop must be respected and enforced by all other bishops, but the pope's jurisdiction embraces all the members of the universal church. The dissolution of the ban after due penance on the part of the excommunicated person is pronounced by the *judex* who has inflicted the punishment, but the pope's power to annul the ban is universal and embraces all the members of the church.

The power to excommunicate could only be exercised in a lawful manner and for lawful reasons; it was not an arbitrary power. In canonical theory an unreasonable or unjust sentence of excommunication possessed no final validity, and indeed such a sentence had no effect whatever before God. Gratian appears to hold that even though an unjust sentence of excommunication has no validity before God it must be respected alike by the excommunicated person and all others until it has been brought before the proper authority; and to this rule, he declares, there is only one exception, namely, where a person has been excommunicated because he will not commit some sin. This same distinction between the validity of excommunication before God and before the church reappears in Stephen of Tournai and in one of the decretals of Innocent III.

Remarking merely that the doctrines of mediaeval jurists in regard to the nature and effect of "just" and "unjust" excommunications, especially those which brought temporal rulers under ecclesiastical ban, fill a large place in the history of political theory, attention should now be drawn to certain other aspects of excommunication as the earliest and most important of all the censures known to the law of the Christian church. From the point of view of theory and history alike the basis of excommunication was the idea of the reclamation of the sinner. Consonant as it was with the fundamental concept of the Christian church as a divine institution, this idea entailed nevertheless most serious consequences not only for the excommunicate per-

sons themselves but also for the whole society of believers. For one thing, the knowledge of the existence of this most serious form of ecclesiastical censure had an important and far reaching psychological effect on society. The fact that excommunication might be pronounced against sinners engendered a widespread fear which in countless cases in western society amounted to terror, permeated as it was by the idea of the importance of the church as God's instrument of salvation and accustomed as it was to the rule of the hierarchy as God's visible representatives. In certain respects salvation was the main interest of mediaeval thought; and this intellectual interest suffused the whole of society, the humble and ignorant as well as the great and the learned. The ever present threat of excommunication, since this extreme form of censure was enshrined in the canon law at an early time, acted as a deterrent; for men feared the consequences of sin when it entailed not only the suspension of the rights of ecclesiastical membership but also, if there was no absolution before death, the torments of hell. It was this fear of hell which the major ban, especially as anathema, brought home to sinners; and from this point of view it is easy to see how and why the church enforced the censure as an effective measure of control over mediaeval society, including temporal rulers as well as their subject populations.

It is now generally agreed that the early history of the interdict as a new form of censure fell within the tenth and eleventh centuries. The interdict may be defined in the most general terms as the prohibition of the religious acts in which believers take part; it assumed two distinct forms: *interdictum locale* and *interdictum personale*. The so-called general local interdict meant the discontinuance of public ecclesiastical functions in an entire country, a province, a district or a single place; whereas, if the cessation of these functions was applied to a single church, the censure was known as a special local interdict. The earliest well authenticated instance of the general *interdictum locale* is the one which was placed on France in 998 by Pope Gregory V, as the result of the contumacy of King Robert the Pious; and other early examples are those laid on England by Innocent III in 1208 and on Rome itself by Adrian IV in 1155. The destructive effect of the general local interdict on social life, excluding as it did whole kingdoms or other territories from the means of grace, caused its frequent use by mediaeval

popes in their struggle with the temporal power; and it was sometimes met by counter measures on the part of states. Its severity was, however, gradually tempered by the introduction of modifications, which permitted during the period of the interdict not only baptism, confirmation and penance but also divine services on the occasion of great festivals, sermons, daily silent masses and certain other religious functions. Because of this course of development and especially since the general *interdictum locale* punished the innocent and the guilty alike, this form of the interdict gradually fell into disuse. Although the special local interdict has survived down to the present day, the last historical example of the general local interdict was the placing of the Republic of Venice under interdict by Pope Paul v in 1606. When the interdict took the form of a personal censure (*interdictum personale*) it was directed against a single person or a complex of persons, such as the inhabitants of a place or the members of a collegiate body; and in certain respects an interdict of this personal character closely resembles *excommunicatio*. A special form of the personal interdict is the *interdictum ingressus in ecclesiam*, or the prohibition of entrance into a church; as directed against a cleric it has the effect of preventing him from conducting divine services and thus suspending a part of his official functions.

In addition to *excommunicatio* and *interdictum* the canon law recognized still a third kind of medicinal punishment, *suspensio*. Suspension, which was a censure applied only to the clergy, could be either *suspensio generalis* or *suspensio specialis, partialis*. In the former case all rights were suspended, while in the latter there was suspension of the rights of ecclesiastical office (*ab officio*) or of the rights flowing from ordination (*ab ordine*) or of the rights to the fruits of a benefice (*a beneficio*). *Suspensio*, like all *poenae medicales*, could be decreed for a period of uncertain duration, or, in other words, until the reclamation of the sinner by due penance and absolution. Although in the normal cases *suspensio* was pronounced as a result of judicial proceedings, after the Council of Trent it might also be decreed *ex informata tantum conscientia*; that is, if the bishop became aware of the fact that a cleric had committed a secret delict, he could without the institution of legal proceedings against the sinner pronounce *suspensio ab officio* and *ab ordine* (not, however, *a beneficio*).

In the later Middle Ages excommunication tended to develop into an instrument serving

ends far removed from its original medicinal purpose. It not only degenerated, especially in periods of corruption within the church, into an instrument of police invoked in almost innumerable trivial causes but, on the other hand, it was elevated into a position of the highest importance as a factor in the world wide politics of the papacy. In the late twelfth century there began the practise of excommunication by "bell, book and candle." In addition to the pronouncement of the decree of excommunication by spoken words there was the act of extinguishing lighted candles by dashing them violently to the ground, and by this method a false meaning of the greater ban was taught to the faithful; for in truth the greater ban, not less than *excommunicatio minor*, was theoretically founded on the notion of reclamation, not destruction. It is also important to observe that, while the language used by the early church in excommunicating sinners had been restrained, in the Middle Ages there was a tendency to use phraseology that was far from temperate, words that indicate in many cases a high degree of recklessness; and this change was no doubt due, in part at least, to the growth of the anathema as a special form of the greater ban. Again, in contrast with the early law and usage of the church there arose in the Middle Ages the practise, sanctioned by the law, of excommunicating not only living persons but also the dead.

The use of excommunication also tended to become closely bound up with civil polity. In many parts of mediaeval Europe, particularly in the Germanic kingdoms and the Carolingian empire, the secular law adopted certain ecclesiastical penalties, including excommunication; and in such cases the civil power obliged the bishops to inflict the punishment. Excommunication, like outlawry, was used to compel the appearance of contumacious parties in both lay and ecclesiastical courts; and if lay courts employed excommunication for this purpose they were obliged to obtain ecclesiastical aid. Moreover, in the courts of the church excommunication became not only a form of censure for sin and a mode of insuring the appearance of the contumacious but also a general instrument for compelling the execution of all ecclesiastical judgments both civil and criminal.

A special use was made of excommunication because of the fact that in many parts of Europe feudalism tended to preserve the ancient custom of private vengeance. Since the secular law was frequently unable to maintain an orderly state

of social life under these disturbed conditions, lay and ecclesiastical authorities united in efforts for the attainment of this end. The most important expedient was the "Truce of God," which, originating in particular localities, was finally extended throughout Christendom. It was called the truce or peace or faith of God because it was made in His name and honor; and, originally applied to certain days in memory of the Passion and Resurrection, it was ultimately made perpetual for certain places, such as churches and public streets, or for certain persons, such as the clergy, women and merchants, or for certain things, such as animals and agricultural implements. Oaths to observe the Truce of God were exacted from all; and heavy civil and ecclesiastical punishments, more especially confiscation of goods, exile and excommunication, fell on those who broke their oaths. In this way religious sentiment, sanctioned by the ecclesiastical censure of excommunication, was used as a means of bringing peace to society in a turbulent age.

The rules in regard to the civil effect of excommunication as distinguished from the ecclesiastical effect of such a sentence fill a large place in European legal history. Since the position of states respecting the church has varied from age to age it is almost impossible to make general statements in regard to the loss or impairment of the civil rights suffered by persons who have been excommunicated. In many respects the course of history has been based on the principle, or fiction, that outlawry meant civil death or excommunication meant ecclesiastical death for the persons who suffered either of these two forms of punishment; and both in the case of the outlawed person and in the case of the one who was excommunicate the death presumed by the fiction was on principle likened to natural death. The civil effect accorded by the state to excommunication has depended in large measure on the extent to which the state, because of its relations to the church, has been willing to place excommunication on an equality with outlawry and thus treat the person who was ecclesiastically dead as also civilly dead. In certain periods of history, when the relations between church and state were especially close and cooperative, the idea prevailed that the person ecclesiastically dead through excommunication was to be regarded as also civilly dead; but, on the other hand, in times of religious tolerance, as opposed to ages in which political persecution of heretics and other persons outside

the Christian community were dominant, the secular laws softened the rigor attaching to civil death. In the period of the Roman emperors after Constantine, since the policy of the state was to maintain unity of faith, there was in general the strict application of the principle that dissenters should be punished by an almost complete loss of their rights under the secular law; but the excommunicate person did not lose his civil rights. While this rigor in regard to dissenters was mitigated under the Germanic rulers, as in Italy, nevertheless excommunicate persons were treated harshly by secular laws. If a person lost the peace of the church he lost also the peace of society; and hence an excommunicate person, standing outside the protection of the civil law, not only lost all his existing rights but was rendered incapable of acquiring new rights. It thus resulted that excommunication and outlawry, the latter of which in Germanic times meant a true civil death in the full sense of that term, were placed on an equality by the secular law. While in many states this idea of excommunication as one of the causes of civil death continued to dominate the secular law of the eleventh and later centuries, the Reformation, which resulted in the withdrawal of many states from the ancient faith, gradually introduced greater tolerance. At the present day, even in states where the Roman Catholic church holds a position of great strength, the old rigor attaching to civil death caused by excommunication seems to be nowhere enforced by secular law.

Throughout Europe as a whole excommunication played in the Middle Ages a highly important role in the relations of church and state; and, in fact, the development of the canonical theory of the consequences of excommunication was one of the main factors in the historical process by which the church acquired, on principle at least, a position of supremacy over temporal rulers. Moreover, the principle, fully recognized by canonists, that the church had the power to declare that under certain circumstances an oath was null and void and hence the oath giver absolved was closely related to the theory as to the consequences of excommunication. In general the excommunicate person was so cut off from the ordinary affairs of life that no one could enter into relations with him without incurring at least the punishment of *excommunicatio minor*; and when the excommunicate person was a king or emperor, the consequences of excommunication, serious enough in the case of

an ordinary person, at once assumed a great political significance. In ecclesiastical theory kings and emperors not less than their subjects were liable to excommunication for just cause; and when, as frequently happened, such august temporal rulers were actually punished by excommunication, they not less than ordinary excommunicate persons were cut off from the accustomed affairs of life. In theory at least the excommunication of a king or emperor made any relations between him and his officials and even his people almost impossible; accordingly, the question was raised as to whether under these conditions the oath of allegiance to the excommunicate ruler was truly binding. In general oaths of all kinds were regarded by the church as falling within the province of ecclesiastical jurisdiction, and the rules in regard to promissory and other oaths formed a part of canon law. Oaths such as the feudal oath were invested with a religious character; and hence, it was argued, the oath of allegiance to a temporal ruler, being of a religious nature, fell within the cognizance of spiritual authority. The position of the church was that the pope could absolve a man from the obligation of his oath of allegiance to a ruler who had since been excommunicated, and Gratian appears to have extended the principle when he declared in substance that deposition of a ruler by the pope *ipso facto* absolved that ruler's subjects from their oaths of allegiance.

In the period of the struggle between the church and the Holy Roman Empire for political mastery of the western world, and not less in the contemporary efforts of the church to bring into political subjection the temporal rulers who were outside the empire, excommunication was in fact one of the most powerful weapons at the disposal of the pope and the bishops. The pope, moreover, in the assertion of his claim to be the supreme authority in temporal as well as spiritual affairs not only excommunicated but also deposed emperors and kings: the excommunication and deposition of the emperor Henry IV by Pope Gregory VII is one of the striking illustrations of the employment of this power by the papacy. In his struggle with temporal rulers the pope also made use of the interdict, sometimes in conjunction with excommunication and deposition, as a political instrument. The general local interdict, which, as already explained, was sometimes applied to an entire country, had a disturbing and even a destructive effect on the religious and social life of the entire community;

for this very reason it admirably served the purposes of the papacy in its effort to control the destiny of political society. By means of the interdict the pope influenced the subjects of a ruler and even the threat of an interdict acted as a powerful measure of spiritual and political control. Thus, to take only one illustration, Gregory VII threatened that if Philip, the king of France, would not abandon the heresy of simony, he would issue such a general interdict, embracing the whole of the country, that the people of France would refuse any longer to obey the king. The exercise of the power to excommunicate and depose emperors and kings and to place their subject populations under interdict was met by counter measures on the part of the temporal rulers, many of whom, and especially the emperor, claimed to be the supreme governors of church and state alike. A memorable illustration of the exercise of the pretended power of temporal authority to control the spiritual is found in the history of the long struggle between Gregory VII and Henry IV. Not only at the Council of Worms but also at the Council of Brixen the emperor and council decreed the deposition of Gregory VII from the papal throne while at the latter council they elected Guibert, the archbishop of Ravenna, as pope in succession to Gregory. Gregory's renewal of the excommunication of Henry and his supporters formed the next stage of the quarrel.

In the long era of conflict between the secular and spiritual power this dramatic struggle between the emperor Henry IV and Pope Gregory VII represents not only the culmination of an earlier development but also the beginning of further efforts on the part of the church to control the western world. Excommunication was used more frequently and with an increasing freedom by the pope and the higher ecclesiastical officials, and with the centralization of the power of the church in the papacy there was the tendency to encroach more and more upon the domain of temporal affairs.

The growth of papal power reached its height in the time of Innocent III (1198-1216). Gregory VII had asserted the power to hold to account for moral delinquency not only the emperor but also rulers in extra-imperial lands, and Innocent III made free use of both excommunication and interdict to enforce his pretensions to control the rulers of European kingdoms. The struggle between Innocent III and King John of England well illustrates this aspect of the long

contest between the spiritual and temporal authorities for mastery. In his effort to bring John to terms Innocent first threatened and then proclaimed a general local interdict applicable to John's kingdom; and a general local interdict, which suspended some of the most valued offices of religion, was by this time a much dreaded penalty in all parts of Europe. While not certainly dooming all dying persons to perdition, nevertheless to pious persons it rendered their state doubtful in the extreme and thus it caused fear of the ultimate destiny of their souls. Innocent's interdict of England did not result in total suspension of religious acts, but it was sufficiently enforced to cause much anxiety. Nearly all the bishops went into exile, and indeed only two remained to the end. While marriages were celebrated at the door of churches and baptism and extreme unction were permitted, no masses were publicly said, the ordinary course of the sacraments was intermitted, the dead were buried in unconsecrated ground and, except to those who wished to make offerings, the churches were closed. The interdict was at last followed by the excommunication of the unrepentant king. While the interdict was used to compel the king to yield owing to the fear and indignation arising in the subject population, the excommunication from the point of view of the excommunicate king himself was an even more dreaded penalty; for, as we have seen, *excommunicatio major* not only cut him off from the church and all its benefits and mercies but removed him from the whole community of Christians and brought the same dire fate upon all who continued to support him or to have any relations with him. Realizing at last that the strength of the papacy was a terrible thing even for kings, John surrendered his kingdom to the pope and received it back to be held of the pope as a fief.

In the feudal age the chief factor in the control of temporal rulers by the pope had been the rebellious tendency of the great vassals of these monarchs; but with the decay of the feudal order of society and the rise of national states, such as England, France and Spain, this aspect of the struggle between temporal and spiritual power ceased to be of any real force. While the papacy had proved to be stronger than the empire, it could not permanently maintain in practise its pretensions to a political suzerainty of the rising states of Europe; and once the territorial states had achieved a position of mastery, excommunication and interdict as po-

litical weapons at the disposal of the papacy ceased to exercise their former terrifying influence on rulers and their subjects. In the gradual progress of this tendency the memorable conflict between Pope Boniface VIII and King Philip the Fair of France, a century after the time of Innocent III, was a prominent landmark; for the successful defiance of the pope by the king of France, who was the monarch of a realm which now possessed a high degree of solidarity, was a clear indication to papal power that kingship had at last risen to a place of great authority in the affairs of Europe. In this connection it should be noticed that Peter Dubois, a prominent jurist who was a trusted councilor to Philip the Fair, laid special emphasis in his writings on the demoralizing effects produced by the free use of excommunication by the popes; he held indeed that although excommunication brought damnation to many souls it yet failed to exercise so much positive influence on human action as did the penalties of temporal law. Similarly, Marsiglio of Padua gave firm expression to the view that excommunication and interdict could be employed by ecclesiastical power only with the sanction of the temporal sovereign; for, he held, the application of those penalties by irresponsible persons interfered with the peace and quiet of the faithful, which it was the very province of the secular ruler to secure.

Although the growth of strong national monarchies tended more and more to lessen the temporal effects of excommunication and interdict, both these forms of ecclesiastical censure were used by the papacy as weapons in the religious and political struggles which marked the period of the Reformation and the wars of religion. The bull excommunicating Luther in 1520, which was publicly burnt by the great reformer himself, is one of the well known examples and others are to be found in the excommunication of King Henry VIII in 1535 and 1538 and of Queen Elizabeth in 1570.

The ecclesiastical disintegration caused by the Reformation introduced a new period in the history of excommunication. Within the Roman Catholic church not only both forms of *excommunicatio* but also *interdictum* and *suspensio* have all been preserved as *poenae medicinales*; but although a special form of the *interdictum personale*, namely, the *interdictum ingressus in ecclesiam*, and also the particular or special *interdictum locale*, which is applied to a single church, are still sometimes employed, the general *interdictum locale*, formerly used to overcome the resistance

of temporal princes, is no longer of any practical significance. In non-Catholic churches of modern times there are many survivals of *excommunicatio* and *suspensio*, but the nature and effect of these forms of punishment depend upon the constitution and law of each one of the various ecclesiastical organizations and there seems to be but little uniformity. Calvin, contrary to canonical doctrine, draws a sharp line of distinction between excommunication and anathema: excommunication is purely medicinal and has repentance and salvation in view, whereas anathema precludes all forgiveness and devotes the sinner to eternal perdition. In general, however, Protestant churches do not recognize anathema in Calvin's sense and in fact look upon excommunication as purely medicinal; and hence in most churches repentance is followed by absolution. In general, again, distinctions are drawn in Protestant churches between the greater and the lesser ban; and usually admonition precedes the final pronouncement of decrees of excommunication. In the history of many non-Catholic churches, including those in England and America, the question as to whether the power of excommunication is vested in the clergy or in the church has been of much importance. While the power of excommunication, in some form or other, is recognized in most Protestant churches, in some of them this power is rarely if ever exercised. Suspension of a clergyman of the Church of England for serious delict may be cited as an illustration of Protestant application of this form of ecclesiastical censure; and at least in this instance the canon law of the Roman Catholic church in regard to *suspensio* appears to have exercised considerable influence.

EXECUTIVE. Orthodox political theory attributes to the state a juristic personality which consists essentially in an ability to form and execute a will. Government is defined as the various agencies or organs through which the state's will is formed and executed. The classification of governmental functions into legislative, executive and judicial (forming the will of the state, executing the will of the state and deciding controversies as to what is the will of the state) is one of the corner stones of modern political science, whether the doctrine of the separation of powers is accepted or not. And the various organs of government are characterized according to which function predominates. Garner's definition of the executive may be taken as typical: "In a broad and collective sense the executive organ embraces the aggregate or totality of all the functionaries and agencies which are concerned with the execution of the will of the state as that will has been formulated and expressed in terms of law."

The basic assumption that the state is some sort of entity which has a definite and distinct will of its own is obviously a highly metaphysical conception, which contemporary social psychology refuses to recognize. The state may be more realistically conceived as merely a human association which has developed for the meeting of certain human needs, the satisfaction of certain human wants; it differs from most other associations in including in its membership all individuals inhabiting a given territory and in the fact that membership is compulsory not voluntary. This political association is organized, and the officials in this organization constitute the government. They may be designated as the rulers, and there is thus, as Léon Duguit says, a differentiation of rulers and ruled. The exercise of authority by the rulers is subject to basic law which is not the expression of the will of a hypothetical and metaphysical entity but the product of the relationships of the members of the association. The government, from this point of view, may be viewed as a collection of public services rather than as organs for expressing and carrying into effect the will of the state.

The various parts of the governmental mech-

anism appear in their historical and institutional character as elements in the organization of the political community. They have a history, they do certain things, they are organized in a certain manner; various types can be distinguished. But they cannot with any accuracy be reduced to the simple classification of legislative, executive and judicial. All of them contribute to the determination of what is the law, to the settlement of controversies, to the application of the law. In actual practise the orthodox theoretical functions are confused. What effectively emerge are merely social control and public service. The traditional classification of governmental agencies as executive, legislative or judicial is firmly fixed, but the study of government or any of its branches must follow empirical and historical rather than theoretical and analytical lines.

Among primitive peoples there is very little governmental organization, although there are universally found more or less elaborate systems of social control which have developed spontaneously to meet the needs of the group. Such organization as does exist is rudimentary; authority is not clearly defined or sharply differentiated with respect to the performance of particular functions. Generally although not universally warlike enterprise on any significant scale is the occasion for the emergence of leaders who for the occasion gather to themselves relatively large powers and may, if active hostilities continue for a long period, become permanent chieftains, tribal or national leaders, kings, endowed with more or less extensive powers in peace as well as war. Alongside the primitive king there may perhaps be a body of retainers who serve as his lieutenants, a council of elders who deliberate and decide upon important matters affecting the community. In some instances the entire body of armed warriors may assent to or dissent from proposals of the highest importance. Whatever the particular form which primitive government assumes, it is inchoate, undifferentiated, ill defined. In the oriental despotisms of antiquity vast powers were possessed by the rulers and an elaborate organization of officials existed but nothing in the nature of the modern differentiation of government. In the city-states of Greece government was well developed; various officials, magistracies and assemblies had definite functions and there is some suggestion of differentiation along modern lines; but it would be misleading to characterize the various particular authorities by the

terms legislative, executive, judicial. The same is true of the government of Rome under both the republic and the empire. To describe the consuls, the tribunes or the emperor as executive organs of the Roman government would be quite inaccurate.

It is only in the Middle Ages that the historical roots of the present system of governmental institutions are found. Feudalism in its earlier phase bears little similarity to the institutional organization of the modern state. But by the twelfth century, in England at any rate, a system of courts was developing with which those of modern times have a direct historical continuity. And by the thirteenth century there are the clear beginnings of the modern system of representative assemblies. It is too facile an explanation to say that courts and parliaments were split off from the royal authority and that what remained came to be the modern executive. But it is true that the modern executive sprang from the royal power at the time when government was differentiating and acquiring definition. A group of great administrative offices which are the historical antecedents of the later administrative departments emerged at this time. These are indeed historically connected with the earlier great officers of the king's court—the constable, chamberlain, steward, seneschal, marshal and the like. But there was a marked difference. The earlier officers were personal retainers of the king; they served him; they were officials of his household. *Theirs* was a personal relationship to the king. But by the fourteenth century their character as public officials came to be recognized. Such officers as the chancellor and the treasurer exercised definite governmental functions. Meeting together in the king's council they constituted the mainspring of an incipient administrative system. Parliament was endeavoring to exercise direct control over them, and the question of ministerial responsibility was thus raised. In the sixteenth century the national state clearly appeared and the king gathered to himself all the theoretical power of the state and greatly increased his actual power. But the great administrative officers of government remained; they even enlarged the area of their authority. Their spheres became more sharply defined, their functions more clearly recognized. In the seventeenth century came the great struggle in England between king and Parliament which was to give the latter complete control over the administrative officers of government. Minis-

terial responsibility to Parliament was not firmly established until well into the eighteenth century; it was not fully recognized until the nineteenth. But it was an implicit and necessary consequence of the Revolution of 1688. Upon the continent the course of political evolution varied in detail from that of England and the process was accomplished a century or more later, but it followed essentially the same course and the product was, as in England, constitutional government.

Institutionally the modern higher executive authorities are directly connected with the great officers of the crown in the period of the absolutist national state. Responsible then directly to the monarch, they have become under the terms of constitutional government in the cabinet type responsible to the representative assembly; in the congressional form they are responsible to the electorate either by being themselves elected by popular vote, as in the case of many of the higher officials in the American state governments, or through the chief executive, who appoints them and who is himself popularly elected. In this shifting of the basis of responsibility there has been no essential change in the character of their functions, although there has been a great expansion of activities. The essential change consists in the larger degree to which they are limited and directed by law and in the political control to which they are subject. In cabinet government ministerial responsibility to parliament is a definitely established principle. But even in governments of the congressional type there is more control of the executive by the legislature than the strict doctrine of the separation of powers would permit. The congressional committees of investigation in the United States perform a most significant role in this respect. In recent years several cabinet members have been forced to resign as a result of such inquiries, and throughout the entire constitutional history of the country such investigations have been effectively used from time to time to enforce an accountability upon executive officials and to control the course of administrative action. The standing committees of Congress, particularly in connection with the examination of department and bureau estimates, have the opportunity to survey the work of the various branches of the administration and to exercise a control over their operations. The appropriation measures and legislation in general are far more detailed in prescribing duties and powers in the United

States than in Great Britain or on the continent. Riders are frequently attached to appropriation bills which constitute definite restrictions upon the executive. Many appointments require ratification by the Senate. Through these and other means a really large control is exercised by Congress over the executive. W. F. Willoughby goes so far as to interpret the relation of Congress to the executive as that of a board of directors to a managerial staff.

The executive in modern governments engages in a wide variety of functions. Garner classifies these functions under the following heads: the diplomatic power, the administrative power, the military power, the judicial power, the legislative power. This is not satisfactory, because the administrative power embraces such a large number of widely different and quite unrelated activities. There is no similarity between such functions as the execution of a death sentence, the investigation of the causes and means of prevention of hog cholera and the appointment of a collector of customs at the Port of New York. The extent and variety of the things which government accomplishes through the executive branch defy classification, and the unquestioned trend toward collectivism in the modern state is continually expanding the scope of these activities. More and more services are demanded of the government. These newer services involve relatively little exercise of the authority of the state; they are not expressions of the mandatory aspect of law. Rather they provide, for those who care to use them, valuable means for the enrichment of life. Thus the executive agencies of government are being transformed from grim law enforcement agents into beneficent servants of the people. The postman on his route, the county agent disseminating useful information on problems of agriculture, the visiting nurse, the highway engineer, the employment bureau, the chemist guarding the purity of a city's water supply, the consul collecting information with regard to foreign markets, the teacher in the public school and the professor in a state university are all formally administrative agents of government and members of the executive. But to pigeonhole them in this wise gives little aid in understanding the work which they do or their significance to our modern civilization.

And if these subordinate members in the hierarchy of administrative officials are excluded from the concept of the executive, it must still be remembered that the heads of the great

administrative departments and indeed the chief executive himself are more and more concerned with the supervision and direction of these service functions of government. The executive in performing its many functions is actually engaged in lawmaking as well as law enforcement. The living and effective law is the product to a large extent of the actual doing of things. The policeman on his beat is a lawmaker as well as an administrator. But more definitely, the higher executive authorities possess an extensive power of supplementing statutes by regulations or ordinances. From their content it is difficult to distinguish between these and statutory law; they are indeed law in all but form. With the growth in the scope of government this ordinance power of the executive has assumed large dimensions. In some cases it is directly conferred upon executive officials by statute, in others it is implied from the necessity of the case. In American constitutional law it is an accepted principle that legislative power vested in the legislature by the constitution cannot be delegated, and the courts have attempted to draw the line between legislation and ordinance making but not with very great success.

In international relations the executive performs a peculiarly important role. A deliberative assembly is manifestly unfitted to conduct the delicate negotiations involved in this area. The requirement of the American constitution that treaties must be ratified by a two-thirds majority of the Senate has frequently proved a serious impediment in the effective conduct of foreign relations. It is only because of the relative isolation of the United States from world politics that it is possible to operate under this constitutional provision. But even in the United States the executive is less hampered in this field than in any other. In other countries the executive is given an even freer hand. The abuses of secret diplomacy may at times be real, and certain safeguards may be necessary, but experience in general is decisive that foreign relations are by their very nature essentially an executive function.

Taken broadly, the executive includes not only the chief magistrate of the nation but the ministers and the entire corps of subordinate administrative officials and even the army, navy and air forces. More narrowly, the term is applied only to the chief of state and his ministers or even to the highest single authority. From the very nature of the executive functions

the organization must be hierarchical. The degree to which the lines of responsibility should run directly from the lowest administrative official to the chief magistrate is a matter of varying practise and opposed opinion. In some countries, for example in France, centralization has been carried out to logical completion; in others, as in the United States, a large measure of local autonomy is preserved. Federal government introduces a complicating factor in providing for autonomous governments with executives quite independent of the central executive. Generally the executive agencies are organized as single officials, although boards, commissions and councils are becoming increasingly numerous. The principle that "to deliberate is the function of many, to act of one" has been generally assumed as axiomatic. "Promptness of decision, singleness of purpose, and sometimes secrecy of procedure" are accepted as desirable qualities of executive action. It has been particularly argued that the chief executive power should be vested in a single individual. Where responsibility is divided among a number of individuals it is likely to be shifted.

There are, however, in practise a number of instances where the highest executive power is confided to a group, with results not so disastrous as the theory would indicate. After the revolution France made several attempts at organizing the executive in plural form, the Directory of 1795 being the most notable. The supreme executive authority in the Swiss Republic is vested in a council; the president is merely a chairman possessed of no larger powers than his colleagues, although he performs the ceremonial duties of the executive office. This system has worked entirely satisfactorily. While the king is the nominal chief magistrate in the English government, the real chief executive is the cabinet, in which the prime minister is perhaps little more than *primus inter pares*. This indeed is true of all governments of the cabinet type. In favor of the plural type it has been argued that it offers less danger of encroachment upon the legislature, less opportunity for a coup d'état. It is further contended that the executive power is quite as much concerned with policies as with mere enforcement of the laws; that the laws are indeed in large measure actually made in their enforcement and that discretion, political wisdom and statesmanship of a high order are demanded. These, it is urged, are the product of deliberation and dis-

Encyclopaedia of the Social Sciences

cussion which can be adequately provided only if the authority itself is placed in a group of men. It is doubtless this consideration that explains the growth in the number of administrative commissions.

The need of energy and expedition of action, of centralized and definite responsibility, of clear cut and unambiguous policy does, however, give the weight of the argument to the single executive. Particularly in time of war or other national crisis the concentration of all power in one man's hands generally receives universal approval. Some system of advisory councils which would afford the element of deliberation and the range of knowledge of a plural executive but which would leave authority centered in a single individual would appear to offer the advantages of both a unitary and a plural executive. But it must always be remembered that political conditions vary so widely that any generalization as to the best form of organization is extremely hazardous.

Chief executives have been chosen in four different ways: by the hereditary principle; by direct choice by the electorate; by indirect election through a body of electors; by election by the legislative body. The first method is employed in monarchies and has the advantages of enlisting the loyalty and devotion of the entire community by surrounding the chief magistracy with the sacrosanctity of something approaching divine prescription. It avoids the dangers of hotly contested elections and the consequent active or smoldering opposition of the defeated party. It makes for stability in government. Many able political scientists are of the opinion that a hereditary monarchical form of government offers the best chance for success in any community which has not advanced to a high level of political intelligence and capacity.

The tendency of political evolution is, however, strongly opposed to hereditary monarchy. Direct popular election of the chief executive carries all the acclaim of the dogmas of democracy. For a politically educated and self-restrained community it offers certain definite advantages. It stimulates widespread interest in politics and contributes to the political education of the people. It establishes a relationship of direct responsibility between the chief magistrate and the mass of the people and constitutes him a powerful organ of public opinion. When he speaks he does so with the voice of the nation. Although elected as a candidate of

a party he is elevated above parties and becomes the supreme representative of the nation. He possesses many of the attributes of an elected king. The objections to this mode of selection are that even in politically developed communities the electorate is not a competent judge of the qualifications of a candidate for this high office; it is likely to be the prey of demagogues and propaganda; the intensity, excitement and bitterness of political campaigns are demoralizing. Furthermore, the possession of great powers derived directly from the electorate may tempt the republican executive to transform his office into a permanent and hereditary one by a coup d'état, as did Louis Napoleon in 1851. If such an eventuality appears remote in the United States, it is only because of the deeply ingrained constitutionalism of the American people.

Election of the chief executive by a body of electors is the mode prescribed by the American constitution for choosing the president. This device enjoyed universal approval among the members of the Constitutional Convention. There were numerous utterances in the debates stigmatizing direct popular election as dangerous and unsatisfactory. Nevertheless, while the forms of this indirect method have been adhered to throughout the course of American constitutional history, the system was almost immediately transformed in practise into one of direct popular election. The framers of the constitution had not taken account of the party system, which effectively made of the presidential electors mere automatic agents for giving effect to the will of their constituencies. This national experience illustrates the difficulty of any system of indirect election. Theoretically it avoids the excitement, tumult and convulsions of a great popular campaign. The choice is left to a body presumably competent to judge of the merits and qualifications of available candidates. But in practise the electors are almost certain to be chosen subject to party pledges, and thus the system is transformed into one of direct popular election in all but name. The selection of the chief executive by the legislature is opposed as in violation of the principle of the separation of powers and as designed to reduce the executive to dependence upon the legislature. It was for these reasons that the Convention of 1787 preferred the scheme of an electoral college. It was believed that election by the legislative body would encourage bargains, intrigues and cabals; that designing can-

didates would be led to hold out rewards of office or other sources of patronage. Furthermore, the imposition of so important a duty upon the legislature is likely seriously to disturb the deliberation of its members on legislative measures which they may or ought to be considering. On the other hand, the legislative assembly may be presumed to possess a higher degree of political knowledge and intelligence than the mass of the electorate and thus be capable of making a wiser choice. The question is entangled with the basic form of government whether cabinet or congressional and cannot be discussed without reference to this. In cabinet government there is much to be said for election by the legislature, although the German Republic has perhaps found that the method of popular election contributes to stability and strength. In a system of congressional government election by the legislature would be impossible. An amendment to the Constitution of the United States providing that the president should be elected by Congress would speedily result in the transformation of the government into the cabinet type. The condition of election would inevitably be the recognition by the executive of his dependence upon and responsibility to the legislature.

EXECUTIVE AGREEMENTS. Not all international engagements are embodied in the form of full fledged treaties, which in the United States require the approval of the Senate. The Constitution of the United States contains no express recognition of the president's power to make international agreements without the consent of the Senate, but a practise has developed whereby he effects certain agreements without such consent. There are three kinds of executive agreements, classified according to the immediate source of the president's power to make them. In the first place, his power may be implied from the provisions of the constitution conferring on him diplomatic powers, making him commander-in-chief of the army and navy and requiring that he see that the laws are faithfully executed. Agreements of this kind may be entered into without either prior authorization or subsequent approval by the Senate. The Rush-Bagot agreement of 1817 between the United States and Great Britain, whereby the two powers undertook mutually to limit the extent of their naval armaments on the Great Lakes, was negotiated under the military power of the president; the frequent settlement by executive agreement of American citizens' claims against foreign countries is incidental to his power in regard to foreign affairs. Secondly, Congress by virtue of its commerce, postal and other powers may authorize the president or a cabinet officer acting on his behalf to make international agreements relating to the subject matter of such powers. Reciprocal

tariff agreements and postal conventions have been entered into in this way. Finally, the president may be authorized by general treaties to make special executive agreements for the purpose of carrying out the treaty provisions. Such are the agreements on extradition of particular individuals arrived at on the basis of an extradition treaty.

The Rush-Bagot agreement has proved to be permanent, but most executive agreements are comparatively short lived. Temporary or provisional agreements intended to serve until more regular arrangements can be made are sometimes called protocols or *modi vivendi*. An example was the protocol of 1898 between the United States and Spain embodying specifications of a basis of peace between the two governments. Some of its provisions were subsequently incorporated in the definitive treaty of peace. In nature and importance of subject matter executive agreements cannot always be distinguished from regular treaties. Thus in 1905 President Roosevelt, being unable to secure the Senate's approval of a treaty with Santo Domingo whereby the collection of the latter country's customs duties was to be taken over by the United States, carried out the plan by means of an executive agreement. Two years later the Senate finally approved a treaty embodying substantially the same terms as the agreement.

Some arrangements may be mere "gentlemen's agreements," such as that entered into in 1907 between the United States and Japan regulating Japanese immigration into the United States. Others are effected by an exchange of notes in identical form, as, for example, the Root-Takahira agreement of 1908 and the Lansing-Ishii agreement of 1917, both of which undertook to define the attitude of the United States toward current questions in the Far East. Such agreements are not binding upon the United States government but are simply declarations of a policy valid only as long as the president wants to continue it. If the president desires to abandon the policy involved he may avoid any allegation of bad faith by negotiating a new agreement to rescind the former one. Thus the Lansing-Ishii agreement was terminated in 1923 by the exchange of identical notes between the two governments.

The Constitution of the United States provides that treaties made under its authority are a part of the supreme law of the land. This, however, is not ordinarily true of a simple executive agreement not made under the authority of a

previous treaty or act of Congress. When, however, the president enters into an agreement which is authorized by such prior treaty or congressional act, the agreement has the force of law equally with the prior treaty or act.

In contrast with treaties executive agreements may be entered into secretly. A president seldom wishes to run the gauntlet of the Senate either during or after negotiations, unless necessary; from his point of view the Senate's refusal to ratify certain international arrangements has tended to increase the importance of devices which remove international agreements from its sphere of authority. Although the embodiment of a large part of important international understandings in executive agreements may virtually evade the constitutional requirement that treaties be submitted to the Senate, nevertheless executive agreements are useful and often practically necessary in the conduct of foreign relations.

EXILE implies the permanent or temporary banishment of a person from his own country imposed or sanctioned by the authorities for ordinary crimes (especially those against the person) or for political crimes.

As a penalty for common crimes exile is a very ancient institution. Its original character was that of a voluntary withdrawal of the offender; later it became a means of avoiding punishment; it acquired a penal character in so far as the authority forbade the offender to return to his country. In this sense it is found in the Homeric polity under the name of *φύγη* applied as a punishment for homicide. Thus Tlepolemus, son of Heracles, flees from Corinth for having killed his father's uncle (*Iliad*, II: 664 *et seq.*); Patroclus flees from Opoesis for having killed Amphidamus' son (*Iliad*, XXIII: 85). In ancient law the homicide was subject to private reprisals

on the part of the victim's kindred but was redeemable on payment of a sum of money (*ποινή*); custom and religion therefore favored exile as an institution which prevented immediate action by the injured and facilitated acceptance of an indemnity and reconciliation.

In the Greek legislation of historic times, when the homicide became subject to sentence by tribunals, exile persisted as an alternative choice offered by the law to the accused; he was permitted to leave the country before the vote of the judges and after the first plea. The parricide, however, was excluded from this privilege. For voluntary homicide the exile was perpetual, involving complete outlawry and the confiscation of property by the state. The fugitive assassin was to remain outside of Athens and was not to participate in the religious functions, the public games and similar communal activities. In the case of involuntary homicide, however, the exile was temporary and the offender was not attainted with dishonor and did not lose his property. Exile was also provided by Athenian law for other crimes, such as voluntary assault and injuring the sacred olive trees.

The institution of exile is invested with an analogous character for crimes against the person in Hebrew legislation concerning the right of sanctuary. From the very fact that the fugitives in order to avoid all pursuit took refuge in the sacred places, where neither private vengeance nor public justice could reach them, the law felt the need of regulating the right of asylum and the procedure of internment in places of refuge in such a way that these sometimes came to be places of exile. Thus unpremeditated homicide involving contributory negligence was punished under rabbinical law by exile in a city of refuge; such a penalty was considered too mild for homicide due to grave carelessness. Minute prescriptions determined such matters as the location and the dimensions of the city of refuge and the means of access to it.

The right of asylum had a similar development in England during the Middle Ages. The canon law conceded the protection of the sanctuary to persons guilty of crimes of personal violence, in order that time might be given for the arrangement of compensation (*wergild*). Here too the procedure was prescribed in the greatest detail. A person accused of felony might flee to the sanctuary; within forty days he had to betake himself to the coroner clad in sackcloth, confess the felony and take an oath to abjure the realm and never to return without the king's

permission. On the basis of this confession he was *ipso facto* convicted of felony, suffered attainder of blood and forfeiture of all his goods but was granted time to fulfil his oath. With the Reformation the right of sanctuary underwent radical restrictions and gradually fell into desuetude.

Far more important is exile as a political device intended to remove from the state dangerous individuals or groups of individuals. In such exile there is usually lacking any criminality in the offense and therefore any penal character; the justification of the institution is based upon reasons of mere expediency which prompt the exclusion of certain individuals in order to restore harmony and unity within the political group. For this very reason recourse to exile presupposes a weakness in the concept of the sovereignty of the state which permits it to evade its inherent responsibility and duty toward its citizens. The expulsion of members is conceivable when the association is of a more or less private nature; and it is not without significance that Rousseau in his *Contrat social* (1762) contemplates the possibility of exile inasmuch as he conceives the state as arising from a contractual act, having the most private nature from a juridical point of view. Exile further presupposes a limited extent of territory, not only because this makes banishment more practicable but also because in a society so restricted the need for homogeneity is greater. This explains why exile was in great favor in the city-state of antiquity and of the age of communes. A political organization which has not yet progressed much in the means of bringing the opinions of dissidents and dissenters into conformity with constitutional forms experiments with cruder and more immediate means of silencing them, exile and death. Special conditions, such as the disturbances produced by civil wars, increase the tendency to resort to exile, raising it to the rank of a genuine political method.

The historical evolution of the institution shows that it attained its zenith in the period when the city-state flourished and that it then declined and was transformed with the territorial enlargement of the state in the Roman period. In Greece the typical political exile was ostracism, an institution probably created in 508 B.C. by Cleisthenes as a constitutional safeguard for the Athenian democracy. Anyone who menaced the harmony and tranquility of the body politic might be ostracized or banished for a period of ten years. In addition to ostracism

there existed in Athens a genuine exile (*φύγη*), formally pronounced by the law not only for ordinary crimes but for political crimes such as impiety (for which Anaxagoras was exiled), maintaining a culpable neutrality in civil war, sycophancy or attempting to modify any decree of the people. Finally, in a general way exile became a weapon in the hands of the parties to be used to get rid of opponents. Every revolution brought banishments en masse in its wake, as after the overthrow of the Pisistratidae, in the period of the Tyranny of the Four Hundred and of that of the Thirty. This was true in other Greek cities also, especially after the Peloponnesian War. Sparta, Corinth, Thebes expelled their adversaries from conquered or subject cities. Often one of the conditions of peace was that a city should expel the leaders of the vanquished party or recall its own exiles and treat them well. The treaty that Philip of Macedon concluded with the Greek cities forbade them to pronounce political exile. In 324 B.C. Alexander caused the recall of all the exiles of Greek cities to be proclaimed from Olympia. There were more than 20,000 of them at the Olympic games.

Political exile implied as a consequence the loss of citizenship and goods. On his return to the city following an amnesty or a change in the government the exile recovered a part or all of his goods. Such restitutions involved serious juridical difficulties when the confiscated goods had been sold. At Athens the alienation of the property might not be revoked, but the repatriots might obtain a suitable indemnity instead. Exile, which was itself the result of the convulsions of civil wars, served in turn to foment and spread them. It was inevitable that political exiles should take refuge in the cities in which their own party or allied parties were dominant; hence such cities became the centers of conspiracies and new preparations for war. Not infrequently exiles in the ranks of hostile armies warred against their fellow citizens who perhaps had themselves once waged war against their own country.

At Rome in the most ancient times the Roman citizen might evade judgment by a voluntary withdrawal. Upon him was then pronounced the *aquae et ignis interdictio*, which placed him under the ban of the law, so that, should he ever return to his country, anyone might lawfully kill him. The penal sanctions of the interdict were thus the consequences of the voluntary act of exile. Even when in practise *exsilium* and *interdictio* came to be confused with each other,

this distinction persisted in the psychological attitude toward exile to such an extent that Cicero was able to say that there was no Roman law by which an offense was punishable with exile and to affirm that exile is not a penalty (*supplicium*) but a refuge and a haven, practically a sanctuary ("confugiunt quasi ad aram . . .," Cicero, *Pro Caecina*: sect. c). Sallust quotes Caesar (*Catilina*, LI: 22) as saying that the laws command that exile be permitted to condemned citizens. Places of exile (the word *exsilium* signified as much the place of residence as the fact of expatriation) were originally the cities of Latium, such as Tibur, Praeneste, Lavinium and Ardea, which were in league with Rome. Reception in the chosen city assured a new citizenship to the exile and implied his renunciation of the Roman. When as a result of the civil war Roman citizenship was extended to all the Italian cities, he had to go outside of Italy, especially into Gaul, Greece and Asia. Still later when with the extension of the Roman Empire and the absence of independent states in the civilized world it became impossible by acquiring a new citizenship to renounce the Roman, there were substituted for the voluntary exile of the republican period two institutions, deportation (*deportatio*) and seclusion (*relegatio*), differing from each other in the gravity of the juridical consequences and differing from the original exile in their coercive and penal nature. When the imperial legislation continued to use the term exile in these new cases, there was posited a *coguntur* or *aguntur in exsilium*, differing clearly from the *permissio* of the republican parlance. In any case seclusion and deportation already bore the character of a "compulsory domicile" or an intraterritorial "sequestration" in the modern sense.

An exile similar to that in force in classic Greece and Rome arose in the period of the communes with the reestablishment of conditions analogous to those of the ancient city-state. It was largely applied by the Italian cities during the civil convulsions to eliminate vanquished parties and insure the homogeneity of the body politic. The history of Florence among others offers conspicuous examples of the expulsion en masse of vast groups of citizens and the confiscation of their property. Thus after the battle of Montaperti in 1260 all the Guelphic leaders were driven out by the victorious Ghibellines, and the latter were forced to leave Florence in their turn when they were vanquished six years later at the battle of Benevento. Davidsohn

puts the number of the expelled Ghibellines at about 1200. As for the rest the less dangerous were allowed to remain in the city; others whom the victors had reason to distrust were confined to certain localities outside the city. In this period too the inevitable political consequences of exile recurred. The expatriated, whether Guelphs or Ghibellines, took refuge in the cities where their party was dominant and from there sowed their intrigues and fomented conspiracies and wars to dethrone their adversaries and wrest from them the control of the city.

With the formation of the great territorial states of modern times and with the affirmation of the principle of state sovereignty, according to which the ties that bind sovereign and subjects are indissoluble, exile is again falling into disuse. But vestiges remain. During the struggle for national unity in the nineteenth century and during the dictatorships following the World War there occurred large movements of citizens from their own countries—emigrations involving the element of voluntary withdrawal to forestall a penalty. What is lacking for exile is action by the authorities to draw juridical consequences from the fact of expatriation and to prohibit return by an *aquae et ignis interdictio*. Something analogous to the Roman institution of the interdict is present, however, in the recent Fascist legislation in Italy, which threatens expatriates who commit acts injurious to the interests of the government of their country with the loss of citizenship and the confiscation of their property.

But, generally, in contrast with the idea of banishment from one's own country the modern state has developed considerably the Roman institutions of seclusion and deportation. Compulsory sojourn in inaccessible regions—from internment in Siberia to "sequestration" in Italian islands—wears the character of an intraterritorial deportation. In this form and with the political intent of maintaining a united front against every possibility of opposition and disintegration, intraterritorial exile comes to be applied today by dictatorial governments. The exclusion of opponents from the body politic is not so easy a thing today as it was in the past, in view of the size and dense population of the modern states and the scarcity of practically inaccessible lands. It is only Russia that has, in the districts bordering on the White Sea and the vast expanse of its Asiatic possessions, territories capable of receiving deportations en masse. And the Soviet government, following and de-

veloping here as elsewhere practises of the czarist regime, makes abundant use of such an opportunity of getting rid of its opponents. Trustworthy statistics on the actual extent of political exile in Russia at the present time are not available. In the period of czarism the average yearly number of exiles rose from about 2000 at the beginning of last century to about 20,000 toward the end of the century. It is probable that these figures have not greatly increased today. The living conditions in the sparse villages of that immense continent were and still are very miserable. Charges of forced labor exacted by the Soviet government from these exiles have resulted in a violent campaign for the boycotting of Siberian products. Russia has also afforded an example of the revival of typical exterritorial exile by the expulsion of Trotsky.

In its psychological and social aspects political exile has never from the remotest antiquity been considered as degrading or as in any way detracting from the repute of the exile. Indeed, the contrary has always been the case, whether for the reason that there is in it a voluntary element, as an act of pride in withdrawing although at the cost of grave personal sacrifice from a degrading judicial submission, or because its determining cause is thought to be not a crime but an ideal dissent regarding the mode of governing the state. Since exile is often the consequence of civil war, during which the decision as to where the legitimate right and authority reside is unsettled, and since the exiles of today may be the rulers of tomorrow, it behooves us to apply to exile the criteria appropriate to a state of war rather than those of ordinary penal law. According to Grote, among the Greeks "ostracism was a compliment." While this judgment may seem rather overdrawn, it is certain that both among the Greeks and among the Romans exile, even if only in a negative way, was an appellation of dignity and prestige. This element of prestige is reflected also in the sentiment of respect with which the exile is usually regarded in the country that shelters him. But still other elements enter into the psychology of the exile to produce a complex of pride, hope, depression, savage love and profound yearning which has made the exile a favorite subject for writers. Life in a new environment, alien to all the partisan passions of the country of origin, carries with it the necessity of readjustments which leave lasting impressions. The exile acquires new habits, new manners of thought, which are sometimes super-

imposed upon the old so that there is created in him a feeling for the country of adoption that is insensibly superimposed upon that for his native land. Sometimes, on the other hand, the lack of understanding and the indifference of the world around him bring on a profound nostalgia, so that, contrasting it with the world in which he lives, his native land becomes a sort of idyllic Eden. And the distance that separates in his mind those countries, the idealized and the real, often causes him to fail to recognize the one in the other. In Mazzini the ideal Italy was so strong that he knew not how adequately to appreciate the real Italy that had come up out of the process of unification, and preferred to continue to live in exile. Aside from these extreme cases exiles are generally characterized by a certain lack of comprehension of their own country, which in their absence inevitably undergoes changes and transformations without their knowledge; so that returning they continue to be in some manner strangers in their own land. Even the love of country undergoes profound modifications in exile. No longer is it

the peaceful and legitimate love of the citizen; but a love censorious and contentious and therefore capable of suggesting even the extreme measure of violence. To take up arms against one's country for the sake of one's country is the extreme and desperate recourse to which this sentiment can lead and to which it often has led.

EXPATRIATION. As used in this article the term means the loss by an individual of citizenship, or nationality, of a state. While expatriation usually connotes permanent departure from the country of which an individual has been a national, and naturalization in another country, these elements may not always be present.

The *Oratio pro Balbo* indicates that the right of a person to change his nationality without obtaining the express permission of the state was recognized, at least in theory, in Rome in the time of Cicero. The right does not seem to have been recognized generally in the Middle Ages. Under the feudal system it was possible, however, for the subject of a prince to cast off his allegiance upon performing certain ceremonies and departing from the kingdom or principality.

The common law of England concerning nationality denied the right of a person to expatriate himself without obtaining the express permission of the sovereign. In the early history of the United States this strict rule of the common law was applied by the courts in a number of cases, notwithstanding the fact that a large part of the citizenship of the United States was made up of persons who had been naturalized and had been required to forswear their prior allegiance in applying for naturalization. The executive branch of the government took a more liberal position with regard to the matter, especially under the guidance of James Buchanan as secretary of state and later as president, and endeavored to protect naturalized citizens abroad, even when they were in the territories of the foreign states from which they came. In this matter difficulties were experienced, particularly in Germany and Great Britain, whence a large part of the immigration had come. Largely as a result of the protests in the United States over the arrest of Warren and Costello in England, Congress on July 27, 1868, passed an act (Revised Statutes, sects. 1999-2001) which declared that "the right of expatriation" was a "natural and inherent right of all people, indispensable to the enjoyment of the rights of life, liberty and the pursuit of happiness" and that "all naturalized citizens of the United States while in foreign countries,

are entitled to and shall receive from this Government the same protection of persons and property which is accorded to native born citizens." The attitude of the United States doubtless influenced Parliament in the passage of the act of May 12, 1870, which provided that British nationality should be lost through voluntary naturalization in a foreign state.

On February 22, 1868, while the Warren and Costello controversy was still unsettled, George Bancroft, then minister to Germany, signed a naturalization treaty between the United States and the North German Confederation according to which naturalization, coupled with a residence of at least five years in the naturalizing state, was held to determine the prior allegiance. It was further provided that the naturalized citizen should remain liable to punishment in the country of origin for offenses committed before his emigration and that if he should take up a permanent residence in his country of origin he should be held to have renounced his naturalization. A residence of two years in the country of origin raised a presumption of permanence. This excellent treaty was the model for treaties subsequently concluded by the United States with many other countries.

Notwithstanding the position which the United States had taken with regard to the right of expatriation Congress neglected to provide expressly by legislation how American nationality should be lost, until the passage of the Citizenship Act of March 2, 1907 (34 Stat. 1228), section 2 of which provides:

"That any American citizen shall be deemed to have expatriated himself, when he has been naturalized in any foreign state in conformity with its laws, or when he has taken an oath of allegiance to any foreign state.

"When any naturalized citizen shall have resided for two years in the foreign state from which he came, or for five years in any other foreign state it shall be presumed that he has ceased to be an American citizen. . . . *Provided, however,* That such presumption may be overcome on the presentation of satisfactory evidence to a diplomatic or consular officer of the United States,

Encyclopaedia of the Social Sciences

under such rules and regulations as the Department of State may prescribe: *And provided also*, That no American citizen shall be allowed to expatriate himself when this country is at war."

The consensus of opinion as to the meaning of the second paragraph of section 2 seems to be that the presumption of expatriation arising under it is terminated upon the return of a naturalized citizen to the United States for permanent residence. According to an opinion of Attorney General Wickersham [28 Op. Atty. Gen. 504 (1910)] the principal object of this provision is to furnish a rule to enable the secretary of state to determine when protection should be denied to naturalized citizens residing abroad. For discussions of this provision by the courts see *United States v. Gay*, 264 U. S. 353 (1924); *Miller v. Sinjen*, 289 Fed. 388 (1923); and *Camardo v. Tillinghast*, 29 Fed. (2d) 527 (1928).

The laws of the members of the British Commonwealth of Nations and of the Latin American countries, with the exception of Argentina and the Dominican Republic, provide that their nationality is lost unconditionally through naturalization abroad. Similar provisions are found in the laws of Japan and of a number of European countries, including Austria, Germany, Denmark, Sweden, Rumania. By the treaties of Versailles, St. Germaine-en-Laye and Trianon, Germany, Austria and Hungary agreed to recognize naturalization of their former subjects by the Allied and Associated Powers as terminating their former nationality. The United States obtained the benefit of these provisions through the treaties with the states mentioned dated August 25, 1921, August 24, 1921, and August 29, 1921, respectively. The laws of a number of European states provide that their nationality is lost through naturalization abroad only in case certain requirements of their military service laws have been complied with. The Italian law on the subject is unique in that an Italian loses his Italian nationality by naturalization abroad but nevertheless remains liable for the performance in Italy of unfulfilled military obligations (art. 8, law of June 13, 1912).

The laws of various states contain provisions under which nationality is lost by acts other than voluntary naturalization in foreign countries. Among these may be mentioned permanent departure from the country, residence abroad for a specified period, failure to return in time of war, evasion of military service, acceptance of decorations conferred by foreign countries and marriage of a woman national to an alien. In recent

years there has been an extensive movement toward the repeal of laws under which women became expatriated through marriage to aliens; the movement has been successful in the United States and in some other countries.

The movement toward general acceptance of the doctrine of the right of expatriation has not made great progress in recent years. The provision for "expatriation permits" in article 7 of the Convention on Certain Questions Relating to the Conflict of Nationality Laws adopted at the Conference for the Codification of International Law, which met at The Hague in March-April, 1930, was not acceptable to the United States, which holds to the position that permits should not be required for expatriation. General assent to the doctrine of the right of expatriation will depend upon radical changes in international organization or a general agreement to abandon or greatly reduce armaments. The principal if not the sole cause of the reluctance of states to grant freedom of expatriation is the desire to maintain large standing armies.

Under the laws of a number of states their nationality may be lost without acquisition of the nationality of another state, so that the persons concerned may become stateless (*heimatlos*). Furthermore, many persons who lost their former nationality as a result of changes in political boundaries following the World War did not acquire a new nationality. Serious national and international problems have resulted from this great increase in the number of stateless persons. These persons are not always welcome in the foreign countries in which they reside and lack of passports or visas makes it difficult for them to go elsewhere. The League of Nations has been instrumental in convening several international conferences in their interest. Thus a number of European states have agreed to issue to certain political refugees within their borders uniform documents of identity, known as Nansen passports. The conference which met at Geneva in August-September, 1927, recommended the issuance of documents of identity to stateless persons in general as well as to persons whose nationality is doubtful or unknown. These documents may be used for identification outside of the country where they are issued if visaed by the proper diplomatic or consular officers, but they do not connote diplomatic protection by the issuing state. Stateless persons must rely for their protection entirely upon the authorities of the countries in which they find themselves.

Expatriation — Expenditures, Public

The 1930 Conference for the Codification of International Law adopted two special agreements concerning statelessness. One provides that a person born in a state of a mother possessing the nationality of that state and a father without nationality or of unknown nationality shall have the nationality of the state of birth. The other provides for deportation, under certain conditions, of expatriates to the countries of which they were formerly nationals. These protocols, while helpful, seem unnecessarily limited.

The number of stateless persons might be reduced greatly by international agreements which would obligate each state to confer its nationality at birth upon all persons who are born within its territory and who do not acquire at birth the nationality of another state *jure sanguinis*; and to adopt measures for facilitating the naturalization of stateless persons within their territories, particularly by shortening the period of residence required as a condition to naturalization

EXPENDITURES, PUBLIC. The expenditures of all public bodies may functionally be considered public expenditures; but in public finance the term is used to designate the expenditures of governments, national, provincial and local. They are distinguished from the expenditures of private individuals and associations by the fact that they need not pay for themselves or yield a pecuniary profit, although governments may make reproductive expenditures in establishing profit making enterprises or building highways paid for in whole or in part by taxes on gasoline or automobiles.

The development of public expenditures can be traced only through the modern period, because earlier writers in the field of public finance failed to deal with the cost side of governmental budgets. Adam Smith's discussion of "the expenses of the sovereign or commonwealth" in his *Wealth of Nations* (1776) is one of the first systematic analyses of the trend of public expenditures, but his example was not generally followed by writers on public finance until nearly a century had passed. Ricardo and Mill neglected the subject of public expenditures; even as late as 1877 Leroy-Beaulieu stated in his *Traité de la science des finances* (2 vols., Paris) that an inquiry into state expenditure did not belong to the science of finance, which he believed should concern itself with revenue only. Few later writers held so extreme a position; the great increase in taxation during the nineteenth century, particularly the increase caused by the assumption of new functions by government, forced theoretical and practical consideration of the character, purposes and limits of public expenditures. The conspicuous increase in taxation after the World War produced renewed discussion of public expenditures and proposals for economy and retrenchment.

The scope of public expenditures is determined primarily by the prevailing economic organization of society, the functions assigned the state and the political pressures of class, group and sectional interests. A primitive economy has neither the complex social organization requiring public expenditures nor the wealth to indulge them. Functions originally of a private character or non-existent may become government functions and increase government costs. Early capitalism insisted on restricting the expenditures of the absolutist state; the contemporary democratic state has increased them beyond the dreams of its predecessors; while the communist state would enormously enlarge the

Encyclopaedia of the Social Sciences

scope of public expenditures. Class, group and sectional interests clash continuously over the amount and legitimacy of public expenditures, particularly in a democratic society.

In early forms of social organization public life and family life were closely linked, and there was little public expenditure in the sense in which the term is now used. Public expenditures developed with increasing social differentiation and political organization. Ordinarily religious activities were the most expensive social function and that which was most likely to be met from the public purse. Defense, the second costly function of early times, was ordinarily contributed by the citizens in their own persons and with their own arms as a matter of course; when military expenditures assumed large proportions they were paid for by levies on conquered and subject peoples. Monuments and other works of art constituted another important form of public expenditure. Some of the great states of early times developed expenditures which resemble those of the states of today. Athens stood out among the nations of Greece as a society which emphasized public works, maintained a service for the aid of dependent children and adults, and escaped heavy military expenditure on account of the voluntary services rendered by its citizens. Rome developed buildings and roads as actively as a thriving new state or province of the twentieth century and distributed public relief much in the manner of a modern city during periods of unemployment. The expansion of public expenditures in Rome was paralleled by a gradual differentiation of public from private revenue.

Feudalism brought back a simpler organization and a tradition which in many ways resembled that of the ancient patriarchal family, and public expenditures as such tended to disappear. The public purse was merged with the private or feudal purse. The church as it assumed state functions developed its own system of public expenditures. Defense became the duty of the feudal organization itself. The cost of protection, like other costs, was incurred for the benefit of the prince or lord; and it was assumed that whatever activity promoted his welfare served by the same stroke the welfare of his people. With the coming of constitutional government the pendulum swung back. Defense became again a public function, and at the same time the expenses of the crown and government became a public responsibility. This principle has persisted through the modern period, for

the essence of constitutionalism is parliamentary control of public revenue and expenditure.

The expenditures of modern governments differ almost as much from the expenditures of the corresponding units two centuries ago as they do from the great states of ancient times. With the exception of defense the expensive state functions of today owe either their origin or the greater part of their development to the demands of modern industrial society. Certain functions, like that of general education, were formerly unexercised or were carried on by the church or feudal organization. Other duties, such as maintaining public health and sanitation, were performed only irregularly and imperfectly.

When Adam Smith wrote the *Wealth of Nations* the outlines of modern public expenditures were beginning to emerge. In harmony with the laissez faire philosophy of rising capitalism Smith limited the role of the state, but at the same time he maintained that its duties included not only defense and internal protection but also the erection and maintenance of "those public institutions and those public works, which, though they may be in the highest degree advantageous to a great society, are, however, of such a nature, that the profit could never repay the expense to any individual or small number of individuals" (bk. v, ch. i). The public works which were advocated included chiefly those for facilitating commerce, such as roads, canals and bridges, and institutions for the education of youth and for the instruction of people of all ages. The interests of capitalism simultaneously required limiting the power of the monarchical-feudal state to permit the free play of new economic forces and increasing the functions and expenditures of the state to encourage industry and commerce.

The period which has passed since Adam Smith's day represents the coming of the industrial age, with its more complex social organization, and the decided growth of state activities. Public expenditures during this time have shown two tendencies which reflect the requirements of the age: the first is to increase considerably faster than population and slightly faster than national income, and the second is to reflect the cost of new government services as well as the traditional costs of defense, protection and administration. Adolf Wagner saw in these trends a "law of the increase of state activities" (*Grundlegung der politischen Ökonomie*, 2 vols., 1892-94) according to which "the central and

Expenditures, Public

local governments constantly undertake new functions, while they perform both old and new functions more efficiently and completely."

Many series of figures have been offered by students of public finance to show increases in public expenditures by the principal nations since the industrial revolution. Unfortunately, few series take price changes into account and consequently they cannot be used with precision. It may be said that the public expenditures of western nations increased during the nineteenth century from two to twenty times, and the tendency has since continued.

A reliable estimate of the extent to which the passage of a century has expanded public expenditures and altered their distribution was prepared for the British Committee on National Debt and Taxation (the "Colwyn Committee," 1924-27) by W. T. Layton, editor of the London *Economist*. According to his figures, which are summarized in Table 1, expenditures of the central government absorbed 5 percent more of the British national income in 1923 than in 1818. The ratio of debt services to the national income was almost unchanged, but war pensions and old age pensions absorbed 2.15 percent more in 1923 than they did a century before and other services had also conspicuously increased.

TABLE I
PERCENTAGE OF NATIONAL INCOME EMPLOYED IN
GOVERNMENT EXPENDITURES,
GREAT BRITAIN, 1818 AND 1923

OBJECT OF EXPENDITURE	1818	1923
Internal debt service	8.12	7.89
External debt service	—	1.24
Pensions (war and old age)	.30	2.45
Defense	3.62	2.78
Other services	1.68	4.80
Cost of collection	.97	.29
Total expenditure	14.69	19.45

In the United States, where the central government by the terms of the federal constitution is permitted few functions other than those of defense and the maintenance of the governmental organization and where the social functions, including education, the only fully developed social service, are therefore relegated for the most part to the states and municipalities, a slightly different situation appears. In this case the assumption of new functions by the central government accounts for only a small although gradually rising sector of public expenditure. The remainder of the increase apparent in the

fourfold multiplication of per capita federal expenditures within two decades is ascribable to the influence of wars, which have invariably left distinct and permanent increases in the national budget in the form of debt and pension charges. When such expenditures have once risen it has proved impossible to force them to return to the levels of the preceding periods. In the American states, the political units which correspond to European central governments as far as the responsibility for education and the general social services is concerned, per capita costs show nearly as great increases as with the federal government. This growth has occurred in spite of the fact that the social insurance principle has not been generally adopted in American states. It is apparent that expenditure for public functions in the United States as a whole shows a tendency to increase like that which is found in European budgets in spite of the difference in the form of administration and in the allocation of public duties. According to the calculations of the National Industrial Conference Board combined federal, state and municipal expenditures in the United States were \$855,000,000 in 1890, \$2,919,000,000 in 1913 and \$12,179,000,000 in 1927. Allowing for changes in the value of money, there was an increase of 175 percent in 1913 over 1890, 205 percent in 1927 over 1913, and 740 percent in 1927 over 1890; on a per capita basis the increases respectively were 80 percent, 148 percent and 346 percent.

The services which absorb most of the increase in public expenditures have appeared chiefly since the industrial revolution. As industrialism takes over the manufacture of goods formerly produced in households, so the modern state performs functions formerly of an individual or group character. The scope of these functions is enlarged by social development, which makes education, public health and the construction of highways cumulatively more important. As cities increase in size their overhead costs increase and require larger government services: municipal per capita expenditures are in direct proportion to the size of cities. Industry, commerce and labor insist upon services which increase public expenditures. Many new social problems arise and since late in the nineteenth century there has been a considerable increase in public expenditures on social welfare, such as old age pensions, health and unemployment insurance, workmen's compensation and aid to widows and orphans. In a number of

countries older systems of poor relief persist and extend beyond the boundaries of the specific social services. But while government outlays on social welfare are increasing rapidly they constitute only a small part of public expenditures. The costs of social services, exclusive of education, ranged in 1927 from approximately 9 percent of combined expenditures in the United States to over 20 percent in Germany; many countries spent less than the United States and none (with the possible exception of Soviet Russia) more than Germany.

A study of the objects of public expenditure since the World War shows that debt and war costs are well in the forefront. National debt, defense, pensions and other war charges in 1927 absorbed approximately one quarter of combined public expenditures in the United States and Germany and one half in England and France. The national debts alone are a serious burden; services on these debts in 1930-31 constituted 37 percent of the expenditures of the central government in Great Britain and 30 percent in the United States.

Expenditures in modern states are well above the possible or theoretical minimum which represents the amount required for debt service plus those provisions for defense and administration which satisfy traditions of long standing. Over and above that minimum is an area where conflicting class, group and sectional interests clash most sharply and affect the amount and distribution of public expenditures according to the balance of political power. Within this area a persistent struggle goes on over increasing or reducing public expenditures. The agitation for reduction affects particularly the social services which the state has taken over recently but is by no means limited to that field. Debt reduction and economies in defense and administration are advocated with almost the persistence which marks the constant criticism of the social services.

Criticism of debt payments as a part of public expenditure is reflected in the position of the British public on the debt incurred in the World War. The British dead weight debt increased from £650,000,000 in 1914 to £7,800,000,000 in 1920. About six sevenths of this amount represented the debt which was owed internally and was therefore susceptible of adjustment without jeopardizing the British government's foreign relations. In order to reduce the heavy annual charge for principal and interest on this debt, a charge which was assumed to be paid by the working class through taxes for the bene-

fit of the investing class, a capital levy upon the rich, the proceeds of which were to be used for liquidation of the internal debt, was advocated by the British Labour party throughout the first post-war decade. It was argued that with a few bold strokes the heavy annual burden imposed by these expenditures could be removed or materially reduced. The movement failed of success through the lack of parliamentary support from members of other parties, and the heavy debt charges remained. The debt policy of the United States was similarly attacked about the same time, although much more moderately. It was the policy of the federal government rapidly to decrease the \$26,000,000,000 debt inherited from the World War at the rate of about \$1,000,000,000 a year. The government maintained this policy of reduction in spite of the criticism that it demanded a higher rate of federal taxation than would otherwise have been necessary; but with the arrival of the economic depression of 1929 to 1931 the debt reduction program was temporarily abandoned.

Defense expenditures are also subjected to attack from time to time. In this case, however, sharp differences of opinion arise between those sections of the population which advocate preparedness for war and those which support programs of armament reduction or disarmament from motives of economy or humanitarianism. Military expenditures increase, however, in spite of all efforts to the contrary.

The sharpest criticism of all is directed toward public expenditure for the social services, although they constitute a smaller item than national debt and war charges. These services are modern in character and involve antagonistic class and group interests; for these and other reasons pressure is constantly brought to bear upon legislators for retrenchment. Such protests are frequently based in part upon the fact that public expenditures on the social services effect a considerable redistribution of income. Money is taken from those most able to pay and is distributed to the less fortunate in the form of public services. In Great Britain, for example, according to evidence given before the Unemployment Insurance Commission in 1931, a sum equal to one seventh of the nation's weekly wage bill was being paid out in cash weekly in the six chief social service accounts. Only 18 percent of that amount was estimated to be contributed by the workers; the remainder came for the most part from taxation, the chief element in which was taxation of personal incomes. It might

Expenditures, Public

therefore be said that in Great Britain income was being redistributed through levies upon the income taxpayer and subsidies of a total of \$20,000,000 weekly to the dependent classes. This argument is used in all countries in opposition to public expenditures on social services.

It is also maintained that the effect of heavy taxation for the support of social services is a burden upon industry and economically unjustifiable. This contention opens up the question of productive and unproductive public expenditures. The older conception of what is unproductive is untenable; nevertheless, many public expenditures are clearly unproductive, such as expenditures on war or on graft, waste and bureaucratic inefficiency. Economic services by governments are productive; the construction of highways, for example, is of value to producers of materials and of automobiles. But the social services may be equally productive. Modern business is inconceivable without universal education. Sanitation, training of defectives and social insurance increase productive efficiency by promoting individual well-being. Frequently the same groups which demand retrenchment in some item of public expenditure urge an increase in other items; and while each group may oppose demands of the others, the net result is a further increase in public expenditures.

It has been regarded as an axiom of public finance that public expenditures determine public revenue; while the spending of an individual, in contrast, is cut or measured according to his income. Although the traditional description of public expenditures appears to hold good with respect to the social services it is not necessarily valid for public expenditure in general, as C. C. Plehn has pointed out in his *Introduction to Public Finance*. Exceptions may occur on account of a legislature's consideration of the taxpayers' existing burden in the instances where unexpectedly fruitful taxation provides surplus revenue or when, as in case of war, expenditures rise so rapidly that it would be unsettling to increase current revenues in proportion.

An understanding of the character and costs of government activities depends upon the adequate classification of public expenditures. Students of public finance differ considerably in their classifications, which are influenced by theories of public spending and by interpretations of state functions. Classifications are fixed while expenditures change. German economists of the seventeenth century classified public expenditures according to the needs of the abso-

lutist state; Adam Smith broadened the classification to include the needs of rising capitalism. But Adam Smith in no wise settled the question, as state functions and expenditures assumed new forms and purposes. Gustav Cohn's four-fold grouping has been provocative for students in later years; he classified expenditures functionally according to benefit—functions performed solely for the benefit of the individual and for which he would naturally be expected to pay; functions which benefit chiefly certain individuals but which society accepts in a larger sense; functions which aid the handicapped; and functions which confer a common benefit upon all members of society. But suggestive as this classification is, it has its limitations and throws no light upon other important problems such as are involved in revenue, administration and the like. Recent discussion has mainly concerned the practicable way of obtaining a functional classification of public expenditures from the departmental accounts which governments publish. The League of Nations uses the following classification: defense, foreign affairs, colonial affairs, supreme organs and general administration, public health, social welfare, education, science and arts, economic administration, financial administration, pensions and debt service. But since classification depends upon purpose, other classifications are necessary for a complete understanding of public expenditures. For ordinary purposes a functional classification is most useful, particularly if the expending organs are organized on a functional basis.

Public expenditures are increasing in all countries. There are considerable variations in amount and distribution determined by the degree of economic development, the prevalence of war and the extent of social services. The best available basis for comparison is the relation of public expenditure to national income, which should be supplemented by figures for public expenditures per capita.

Differences in the forms of political organization considerably affect the distribution of expenditures between central and local governments. In France expenditures of the central governments constituted approximately four fifths of the total, three quarters in Italy, three fifths in Great Britain, one half in Japan and Canada and one third in the United States and Germany. It is apparent that comparisons of national expenditures alone are misleading. Excluding the United States and Canada, there are no considerable variations in public expendi-

tures as percentages of national income, although the percentages must be taken with caution owing to the tentative character of the data on national incomes.

TABLE II

PUBLIC EXPENDITURES IN SELECTED COUNTRIES, 1927*

COUNTRY	BY CENTRAL GOVERN- MENT (IN \$1,000,000)	BY CENTRAL AND LOCAL GOVERN- MENT (IN \$1,000,000)	TOTAL PUBLIC EXPENDITURES	
			PERCENT OF NATIONAL INCOME	PER CAPITA
United States	4,069	12,179	16	\$102
Great Britain	3,815	6,084	29	135
Germany	1,561	4,093	30	65
France	1,661	2,102	25	51
Italy	1,072	1,403	30	35
Japan	644	1,424	24	23
Canada	325	701	13	76

* Operating expenditures of post offices and other state economic enterprises are excluded.

Source: Compiled from the official statistical yearbooks and abstracts for 1930 of Great Britain, Germany, France, Italy and Canada; League of Nations, *Memorandum on Public Finance, 1926-1928* (Geneva 1929); National Industrial Conference Board, *Cost of Government in the United States, 1927-1928* (New York 1930); Fisk, H. E., "Some New Estimates of National Incomes" in *American Economic Review*, vol. xx (1930) 20-27.

Public expenditures are ordinarily higher than taxation. The ratio of taxation to public expenditures varies in different years and in different countries; in 1927 the ratio was approximately three fifths in Canada, Japan and Italy, seven tenths in Great Britain and Germany, three fourths in the United States and four fifths in France. The difference was made up by loans, administrative revenues and profits from government economic enterprises such as post offices, railways and monopolies.

Public expenditures and consequently taxation absorb a growing proportion of the national income. In spite of the demands for retrenchment the tendency is for public expenditures to continue to grow as governments absorb more economic and social functions in harmony with the growing complexity of society and the pressure of group and class interests.

EXPERT. The use of the expert in government and social affairs has assumed prominence concurrently with the adoption of a new notion of the function of government itself. This has come to be thought of not as the keeping of the peace and the enforcement of contracts but as the facilitation of the good life and the removal of friction by a technique of social engineering. The novel complexity of modern social conditions has rendered the development of such a technique imperative for efficiency.

The recognition of the need for superior or esoteric knowledge in government is not new. The medicine man or shaman laid claim to such knowledge and it has been the basis of the power of the priest in government as distinct from that of the warrior. The pontiffs of very early Rome, if folk etymology is correct, may have assisted with their knowledge of spells and omens the skill of the engineer. Certainly such priestly assistance was given to military leaders. The first philosophical exponent of the notion of government by the expert was Plato. Plato, however, does not visualize the expert in government as a priest possessed of occult knowledge but rather as a technician, comparable to the physician or the weaver yet possessing not merely practical skill but precise and systematic knowledge of his subject, which was the architectonic one of social or political control. A fusion of these two notions of special grace and of superior technical knowledge underlies the Catholic doctrine of a priesthood entrusted with the spiritual direction of Christian society.

The insistence of Protestantism upon the om-

incompetence of the private conscience aided by a common sense interpretation of the open Bible, symbolized by the burning by Luther of the book of the canon law, was entirely inimical to the recognition of the expert in religious society. When the modern democratic movement sprang out of the Puritan rebellion there was a like insistence upon the sufficiency of the plain man and of the amateur, which reached its culmination in the political philosophy of Andrew Jackson. Whereas these democratic movements were largely led by lawyers, members of what can claim to be the first secular expert profession, the twentieth century saw an interesting revolt against the tendency of this profession to monopolize legislative posts. As a sign of the turn of the tide it may be noticed that this agitation was conducted, especially under the emergency demands of war, in the name of "business government."

The demand for greater perfection in administrative methods, the enlargement in scope of what are understood to be the functions of government, and the increasing complexity of civilization and its needs, involving division of labor and specialization, have all militated in favor of the use of the expert. In the civil service of Germany, Great Britain and other nations the political appointee has been progressively replaced by those admitted as the result of competitive examination, who are expected to look upon their work as a life profession. The expert knowledge of civil servants, their organization and their power have grown in many countries to such a point that attention is being directed to the question how far the civil service is trespassing upon the proper field of the judiciary and the legislature. The same tendency to increase the power of the governmental expert is apparent in the field of local government, especially in connection with the appointment of city managers to exercise the powers once vested in elected mayors. An interesting corrective to the growth of bureaucracy may be found in the rise, especially in the United States, of expert institutions and research bureaus able to supply technical information and advice, but whose members are not recipients of official salaries and enjoy none of that administrative power which renders bureaucratic esprit de corps dangerous.

The assumption of new and more delicate functions by the legislature and the courts in the modern state has led, first, to serious discussion of reform with a view to placing representation upon a functional basis so that legislation might

be discussed by persons of appropriate training; and, second, to the appointment of persons of expert knowledge, such as consulting psychiatrists, as advisers to the court. This latter tendency has the merit of securing impartiality and eliminating the presence of experts brought in to give evidence favorable to the rival parties in suits. In connection with the work of the executive a distinction is now being made between advice based upon a technical knowledge of departmental administration, such as the civil service possesses, and advice based upon fundamental research unlimited by any administrative presuppositions. The appointment in 1930 of the British Economic Advisory Council, in succession to the Committee of Civil Research, is a sign of the development and organization of this branch of the public service in the economic field. Such technical study has of course long been recognized as important in military and admiralty matters. Economic planning has been utilized most extensively in Soviet Russia and in Fascist Italy. When governments begin to lay down regulations in the field of hygiene, medical officers are required and an intimate relationship becomes necessary between the government and purely scientific bodies such as the Medical Research Council in Great Britain. The extent to which the economic development of tropical countries depends upon advice from medical, biological and agricultural experts has been recently recognized, as has the importance of ethnologists and anthropologists in dealing with primitive tribes and in other problems of colonial government. The psychologist's competence to advise in the field of education is also recognized.

A higher administrative standard and an expansion of the field of government activities have been sought as the greater complexity of the problems of control in the modern world and the incompetence of lay common sense to deal with them have been recognized. It was inevitable that the increasing use made of the expert adviser in the field of business should have its repercussion upon political and organized social life. Matters hitherto regarded as appropriate for the activities of the politician are now felt to be more wisely handed over to economic or financial experts for investigation, which has frequently compelled the acceptance of conclusions entirely unpalatable to popular taste and unlikely to be reached by unaided lay judgment. Successful work was performed by such experts under the auspices of the League of Nations in connection with the financial reconstruction of Hungary

and Austria and the advice given to several countries in currency problems. The most striking instance of the transfer to experts of a question once regarded as preeminently political (in the sense of affecting national security) has been the use of the Dawes and Young commissions on German war reparations. The value of such commissions, as General Smuts has pointed out, is that they enable the politician to protect himself from the pressure of ill informed popular clamor. That the suspicion which has generally fastened upon bureaucracy shall not fasten upon all *expertise* is one of the matters of prime concern in connection with the future of good government. As General Smuts has said, the chief political problem of the present is "to find for the expert an organic place in the workings of democracy."

Criticism has been directed against the development of *expertise* upon the grounds that experts are frequently inspired by a caste spirit, are averse to change, are moved by an arrogance which prevents them from judging the importance of their own conclusions in proper perspective, and that they sacrifice the insight of common sense to the intensity of their own experience in a limited field and fail to recognize that demonstrations of fact do not settle issues concerning values.

Admittedly there is a tendency upon the part of civil servants to treat human beings "as state-documents walking." This trait, however, is probably distinctive of the administrator and man in office, trained or otherwise, rather than of the expert as such. A more serious risk is that experts working under political authorities with whom they are out of sympathy may so use their technical skill as to render the plans of their political chiefs abortive. This risk serves as the justification for the policy, generally identified with the name of President Jackson but having an abundance of precedents in earlier British policy, of making extensive changes in the civil service with each political change in the administration. Especially is this danger of sabotage likely to be real where the experts are drawn from the middle classes and forced to work under a proletarian government, as in Soviet Russia. The situation in Soviet Russia, however, is in many respects peculiar. The revolution has been so extreme that it has alienated the bulk of that trained intelligentsia which in other countries has been highly sympathetic toward reform; it is so recent that time has not yet elapsed for the training of new and politically sound experts

such as the French Revolution was able to utilize, in the military field, in its later phases; and owing to the agricultural character of Russia the body of skilled artisans which might provide suitable material for training has been small. In Great Britain on the whole no difficulty has been found in securing the loyal cooperation of a highly trained upper middle class body of expert administrators with a socialist government.

The expert is surrounded by none of those trappings of power which have hitherto distinguished the rulers of mankind; he is concerned rather with the administration of things than with the rule of men. Nor is it just to attach odium to the expert in the art of ruling, whose chief task is to understand human psychology, because departmental experts in banking or in naval construction often do not understand it at all. Questions which political experts are called upon to decide, although ethical when regarded as ends, may be technical when regarded as means. Professor Charles Beard has pointed out that government constantly faces large questions of choice which cannot be solved by scientific method alone—questions involving intuitive insight, ethical judgment and valuation. The difference between the expert, or Platonic, conception of government and that democratic conception which may be described as Jacksonian is that in the former case the task of the statesman is considered to be that of studying the social problem and after making his diagnosis of applying a remedy at once experimental and scientific, consistent both with the ascertained facts and with the normative ideals or aims of the society in question; while in the latter case the task of the political amateur is to give expression to the will of the sovereign and omniscient people on matters in which its conscience may have been stirred and by this fiat and thaumaturgical process to change the social situation in accordance with popular wish and caprice without regard to any natural laws of human psychology, economics or sociology. The disasters attendant upon the latter course are written large upon the pages of history and provide the chief justification for any plausibility which arguments against democracy and on behalf of various forms of benevolent despotism may possess.

EXPERT TESTIMONY. The necessity of establishing in litigation points of science, art and technical practise has probably been long recognized. Roman praetors on appropriate occasions appointed physicians, midwives, persons skilled in handwriting, surveyors and presumably mathematicians to aid in the performance of judicial functions. At present scarcely any countries lack regulations respecting expert testimony. In the United States widespread reference of factual questions to the average intelligence of juries makes the expert particularly necessary. Popular education can scarcely keep pace with the rapid extension of applied science.

Scientific explanations in the court room face difficulties, some of which are inherent and unavoidable. Litigation may hinge upon matters as to which learned men are honestly at loggerheads. Nor are events giving rise to lawsuits always or even often sufficiently foreseen to be fully observed, let alone controlled. Other difficulties arise from the nature of judicial procedure. These can be best realized by considering the three principal ways for bringing expert knowledge to bear on litigation.

An expert or body of experts may be used as part of the determining tribunal itself. This plan appears early in the history of English law. Bracton mentions the jury of matrons *de ventre inspiciendo*. During the fourteenth century, probably earlier and certainly for hundreds of years thereafter juries of English tradesmen or merchants tried issues to which their special experience had useful application. Throughout Europe and South and Central America many codes provide elaborately for appointment in civil litigation of experts whose function is to investigate

and report upon specified issues, as, for example, the codes of France, the Argentine Republic, Paraguay and Uruguay and also the federal law of Switzerland. Thus there develops something like a trial within a trial, the necessity of impartial judgment by the experts being strongly emphasized. The weight accorded such experts' reports varies from country to country, in some systems depending upon the subject matter of investigation as well as upon the unanimity or diversity of the reported conclusions. Rather less frequently nations of the civil law group have provisions for somewhat similar handling of technical issues in criminal cases. In English and American courts the use of experts in a judicial capacity is now rarely if ever seen, but such administrative tribunals as railway or commerce commissions and industrial accident boards give litigants the advantage of skilled determination.

A second method of enlisting the services of experts is to employ them as advisers to the court. Alongside the old practise of summoning special juries English courts early developed a usage of consulting surgeons, grammarians and merchants upon technical points. Broad power on these lines still exists in England, although apparently it is sparingly exercised beyond maritime and patent litigation. In the United States most judges would probably hesitate thus to seek advice except so far as permitted under the doctrine of judicial notice or authorized by express statute. Where the civil law prevails, such consultation is much more acceptable, not merely because of code provisions or implications but for lack of the strait laced rules of evidence binding Anglo-American courts.

A third method of dealing with expert testimony, according to which it is presented directly to the jury or other persons trying the facts, has been worked out in Anglo-American law. Case law on the topic began its growth in the seventeenth century, but it was retarded by the concept that it is for the jury and only the jury to draw inferences and form conclusions, witnesses being confined to statements of what they had seen and heard. A definitive English civil case sustaining the admissibility of scientific expert opinion (*Folkes v. Chadd*, 3 Dougl. 158), that of a well known engineer, came up only as late as 1782. At present the contentious presentation of expert knowledge considerably overshadows other methods of attaining the same end in English courts, and very nearly eclipses them in courts of the United States. It is not to be inferred, however, that the alter-

native procedures employed under the civil law similarly eclipse the contentious method before tribunals of other foreign countries. On the contrary, in France, Germany and elsewhere experts produced by the parties are heard on occasion with such approximation to common law practise as different trial usage admits.

Every method for the securing of expert testimony is open to some form of criticism. The use of trained minds attached permanently or temporarily to the tribunal for determination of technical questions seems in theory quite ideal. American constitutional provisions, however, guaranteeing "due process of law" or trial by jury may require that the determination be of *prima facie* or evidential value only, unless the litigants stipulate for finality. Apart from constitutional objections, there is to be considered the added judicial expense of permanent boards of experts. Moreover, it may be doubted that any country could furnish a sufficient number and variety of experts both capable and willing. Furthermore, experts so employed might come to constant deadlocks, and the courts might not be able to handle the complex problem of administration. The limit of practical advance along this line lies perhaps in the establishment of certain technically specialized tribunals or divisions of tribunals, such as the English Commercial Court and some American administrative bodies, as well as in the increasing judicial and legislative recognition of commercial arbitration.

The employment of disinterested experts as advisers to the court seems unworkable where juries are finally responsible for solution of factual issues, nor is this way of acquiring information beyond reproach even where the judge handles fact as well as law. British commentators object to judicial receipt of advice from persons whose exact views and possible errors are not disclosed by open examination. A judge may be far from infallible in his estimates of professional competency unrelated to law. Critical comment has also emanated from continental sources, not disclosing the same ingrained faith in cross examination but emphasizing the risk of unfair surprise to litigants. Yet the principle of this consultative method has been employed in thoroughly commendable fashion. A well known Massachusetts statute—with which may be compared a law of Hungary dating back to 1896 or earlier and a California act of 1929—provides for advisory mental examination of certain criminal defendants before trial. The reports made

are accessible to court, probation officer, prosecutor and defense counsel. Despite imperfect administration the statute has improved Massachusetts practise relating to the common defense of insanity.

At best, however, American courts must long continue to receive most expert evidence through contentious party presentation. The fundamental difficulty here seems largely insurmountable. *Ex hypothesi* experts testify to matters beyond the training and experience of those who must render the decision of fact. In a clash between experts the triers lack qualification to choose the sounder view. Forensic aptitude and clever manipulation may well oust real learning and solid judgment. Certainly this risk is not lessened by the shallow competency of some "experts" whom the courts tolerate or by the ignorance, haggling and artificial restrictions with which lawyers and judges alike sometimes confuse presentation of specialized information. The so-called hypothetical question is only too often a necessity and a very cumbersome one; it can rob an examination of intelligibility if framed without the firm mental grasp essential to terse description of decisive factors. Moreover, it is frequently charged that partisanship and self-interest fatally depreciate our expert evidence, a criticism directed particularly at the physicians and alienists who are so frequently called in personal injury actions and criminal prosecutions. Doubtless the evils of expert testimony in this respect are exaggerated but the popular view is distinctly cynical, nor are causes for cynicism hard to find. Now and then a notorious case stirs the suspicion that any man with a long enough purse can obtain expert testimony on either side of a question or even on both sides successively. In personal injury actions attending physicians naturally testify for plaintiffs and it is frequently obvious that, as the litigating patients are without means, the physicians' only chance of pay for either testimony or treatment is contingent upon legal victory. Yet many poor men cannot otherwise obtain medical assistance except through charity.

In Germany and many other countries experts are officially listed or approved. It has been urged that American legislatures or courts, without trusting blindly to mere mechanical classifications, might attempt some weeding out of incompetents by this device. As a corollary trial judges would be expected to require much more than perfunctory showings of capacity for the particular business in hand and to prevent the

blocking of scientific elucidation by futile procedural technicalities. Sharper and more frequent limitation of the number of experts to be heard would tend to raise the quality of evidence and to cheapen and expedite proceedings. A rule that each party must disclose his list of experts some time before trial is at least worthy of consideration. To end the subsidizing of experts it is sometimes proposed that they be restricted to the nominal fees payable to lay witnesses. Such an extreme practise would impose too many burdens upon prominent technicians and professional men and would lower the quality of evidence by discouraging adequate preparation before taking the stand. A more workable rule would remove the matter of fees from the realm of private agreement and leave their amounts to judicial determination. Much legislation to this effect already exists outside common law countries. Indeed, in some foreign court systems regular schedules of expert fees prevail. A number of American states have statutes empowering judges to grant special witness fees to experts. At least one state, Michigan, has since 1905 coupled with this a strict provision forbidding additional compensation, and reported decisions indicate that it has not become a dead letter.

Another warmly advocated check on partisanship is judicial appointment of expert witnesses. This is a common expedient the world over and is employed in several American states. But twenty-one years ago the Supreme Court of Michigan held that the due process clause rendered unconstitutional a statute providing for judicially appointed experts in criminal homicide cases (*People v. Dickerson*, 164 Mich. 148). Although the parties were permitted to call their own experts as well, the opinion argued that the testimony of official experts would receive undue credit and that it was no proper part of the judge's function to select witnesses. Not long thereafter, however, a North Carolina trial judge was sustained by the state Supreme Court when he called an expert witness in a murder case on his own initiative [*State v. Horne*, 171 N. C. 787 (1916)]. In 1930 the Supreme Court of Wisconsin sustained a statute resembling the earlier Michigan act against claims that it compelled self-incrimination, violated the guaranty of jury trial and entrusted the judge with a non-judicial function (*Jessner v. State*, 231 N. W. 634).

The Wisconsin decision is likely to shape the future trend of decision and to stimulate legislation. Indeed, even before it was handed down,

California by acts of 1925 and 1929 had joined the states empowering judges to appoint experts. Practical consequences are debatable. Prediction will surely be unreliable if based only on experience with officially appointed experts in foreign countries where the whole tradition of forensic specialists has long been of impartiality as opposed to partisanship. Striking nearer home, judges in one or two of the New England states under statute or by inherent authority have appointed surveyors to run lines and make plans in land litigation. After doing this work the appointed surveyors may be called as witnesses. It is said that in Maine the practise succeeds, the parties rarely attempting to controvert the court expert by evidence from opposing experts. But here the tribunal deals with what lawyers would think of as scientific fact rather than mere opinion. As fast as science removes matters from the field of speculation and controversy to that of accepted certainty, trouble in proving them tends to vanish. Expert evidence, if needed at all, becomes expositive instead of combative. The incentive to call rival witnesses is minimized. In Massachusetts the Industrial Accident Board, passing upon controversial medical questions, has found the reports of officially chosen physicians serving for moderate fees satisfactory to all concerned, but it is to be remembered that the board is really a specialized tribunal capable of detecting medical error and not likely to be unduly moved by any clash of experts. Plaintiffs pressing or defendants meeting similar claims before ordinary courts might deem it advisable to call their own skilled witnesses despite the use of court appointees.

Without denying the wisdom of some legislation to stay obvious abuses, Americans interested in the betterment of expert testimony may find the practise of English courts a basis for significant inference. These tribunals, utilizing little peculiar legislation about experts but maintaining notably high trial standards, have succeeded under the common law in keeping clear of the more notorious American difficulties. Very likely America's most substantial hope lies in a steady lifting of professional attainment and moral tone on the bench, at the bar and in the ranks of experts themselves.

EXPLOITATION. The word exploitation is a borrowing from the French and originally meant the working of mines or farms or similar enterprises. Its present use in a larger social sense may be traced to the idea found in all periods of the history of western social thought that some individuals, groups or classes benefit unjustly and unfairly from the labor of or at the expense of others. With the formulations of economic thought by the physiocrats, Adam Smith and Ricardo this idea assumed a modern form in the distinction between productive and unproductive labor and in the analysis of value and of the shares in distribution, although neither Smith nor Ricardo was much concerned with such implications of their value concept, unless in relation to the returns of the landlord class.

English anticapitalist and socialist writers of the third decade of the nineteenth century (Ravenstone, John Gray, Thomas Hodgskin, William Thompson, Robert Owen) formulated on the basis of the Ricardian concept the first theories of exploitation in a definite sense of the term. They regarded all wealth appropriated by the owners of capital and employers as an unjust deduction from the product of the laborer and condemned the procedure in strong terms. Quite independently of Ricardo the concept of exploitation was elaborated about the same time by the Saint-Simonians and later by Proudhon on the basis of an analysis of property as the right to enjoy the fruits of labor without performing any of the tasks of labor. All these writers differed among themselves as to the justness or unjustness of the various rewards of property such as rent, interest and profit. But, unlike social reformers such as Sismondi, who regarded exploitation as a regrettable accident due to individual ignorance or weakness, they agreed that it was an inherent defect of the modern economic system.

From these beginnings the idea of exploitation took a long step toward a large and general theory in the work of Marx, who linked it up

with the idea of surplus value. One may say that the entire economic system of Marx is a theory of the exploitative process under capitalism: the first volume of *Das Kapital* analyzes the origin of surplus value in the process of production or the methods of labor exploitation; the second volume explains how the exploitative process affects the circulation of capital; the third volume traces the laws determining the division of the total product of exploitation among its beneficiaries as profits, rent and interest.

Marx' theory of surplus value or exploitation is based upon the three distinct concepts of value, labor and labor power. Labor is the only source of value. Value is the embodiment of a certain amount of average, simple, socially necessary labor. The worker sells his labor power, whose value is also measured by the amount of labor necessary to reproduce it. The worker, however, can and does use his labor power longer than is necessary for the reproduction of its value and thus creates an increment of value—surplus value—which is appropriated by the employer or by the owner of the means of production. The process of creating surplus value is merely the continuation of the process of producing value beyond a definite point. The various methods by which capital exacts this surplus—prolonging hours of work, improving methods of production, increasing intensity of labor—and the relation of variable to constant capital determine the extent, degree and forms of exploitation. As all value is created by labor, surplus value is the only appropriable surplus available and is the general form of the sum of all the surpluses which are appropriated without any equivalent return by the owners of the means of production in the form of profits, interest and rent. Being not only a social thinker but a revolutionist, Marx did not confine himself to a mere statement of the theory of exploitation. *Das Kapital* is strongly tinged with moral indignation and satirical denunciations of the exploiting classes and with profound sympathy for exploited labor. Marx' theory of exploitation and his condemnation of it became a marked feature of all socialist arguments and even influenced labor movements which expressly repudiated Marxian philosophy, e.g. the American Federation of Labor during its earlier history.

A large part of the economic and social thinking of the last thirty years may be said to have revolved around the attempt either to strengthen

or to weaken the theory of exploitation. Marginalist economists and productivity theorists have tried hard to deduce the righteousness of the price process. Liberal economists such as John A. Hobson have attempted to pare down the theory of exploitation by drawing a distinction between necessary costs of maintenance and surpluses and between productive and unproductive surpluses. Socialists of the revisionist school dropped the theory of surplus value as inadequate for the explanation of economic facts and as of little use for socialist propaganda. The upshot of all such thinking has been, on the one hand, to offer arguments in justification of the role of direction, management and organization in industry and to emphasize the need for some provisions for saving. On the other hand, the exploitative process under capitalism has been analyzed and distinctions have been drawn between the absolute exploitation of labor at the point of a subsistence minimum and relative exploitation at the point of distributing large social surpluses.

An interesting light has also been thrown upon the concept of exploitation by developments in the Soviet Union. Under Soviet economy wages are in a way fixed and a large part of the national product goes to develop industry, to pay political and other officials, to maintain an army and to support the proletarian dictatorship. The question whether there is surplus value in Russia and who appropriates it has given rise to considerable discussion. Some Soviet economists hold that there are in the Soviet Union a socialist surplus value and socialist exploitation. Others contend that surplus value is a concept historically possible only under capitalism and would designate the surpluses in Russia as surplus product. They deny the existence of exploitation on the ground that the surplus labor of the Soviet worker is used to improve education and social conditions and to maintain the workers' state.

Already in Marx one finds the extension of the idea of exploitation to the relationships between races and especially between the industrially developed and industrially backward countries. The socialist followers of Marx were perhaps the first to clarify that idea by their analysis of imperialism and their attacks upon imperialistic policies. From the Marxian point of view, especially developed by Lenin, imperialistic exploitation is but another form of extracting surplus value related to the process of making surplus value under capitalism and is

inevitable under that system. The non-Marxian theorists of imperialism also imply a process of exploitation of the colonial and semicolonial countries by the advanced industrial countries, by means of an open or disguised appropriation of unpaid labor, but to non-Marxians and liberals imperialist exploitation appears capable of limitation, if not abolition, even under capitalist conditions.

The other uses of the term exploitation to characterize the status of women, the economic dependence of investors on the uncontrolled practices of corporations, or the losses inflicted on farmers through the processes of finance or trade, may be justified either as analogies or as special forms of the general concept.

EXPORT ASSOCIATIONS are combinations in trade organized for the purpose of conducting export trade from the United States and specifically exempt from the operation of the anti-trust laws by the Webb-Pomerene Act of 1918 (40 Stat. 516). The wave of interest in foreign trade which swept the United States following the outbreak of the World War focused the attention of the country on the necessity of strengthening the competitive position of the American exporter, particularly of the smaller producer, and of placing him on a level of competitive equality with foreign combinations. In 1916 the Federal Trade Commission recommended legislation establishing clearly the "legality of cooperation in export trade." Two years later the recommendations were embodied in the Webb-Pomerene Export Trade Act.

The act grants exemption from the antitrust laws to an association ("any corporation or combination, by contract or otherwise, of two

or more persons, partnerships, or corporations") organized for the sole purpose of, and solely engaged in, export trade from the United States to foreign countries, provided such an association shall not restrain the export trade of a domestic competitor, enhance or depress prices or substantially lessen competition within the United States or otherwise restrain trade therein.

Export trade is interpreted strictly; it does not include manufacturing, even in the case of products intended solely for export. Originally it did not apply to sales to export houses for export, but later rulings by the Federal Trade Commission extended the meaning of the term to sales within the United States if the products sold are intended for and actually enter export trade and to arrangements in which an association confines itself to allotting export orders among members and to fixing prices at which members shall sell in export trade. Similarly, the legality of agreements between export associations and foreign combines has been definitely established by a ruling of the commission allowing such cooperation, provided the combination does not extend its operations to the American domestic market and its activities do not reflect unlawfully upon domestic conditions.

Export associations must file with the Federal Trade Commission within thirty days of organization, and annually on January 1, a copy of their charter, by-laws and agreement and the names and addresses of officers and stockholders or members. The commission may require additional information as to their organization or operation. If an association is charged with violating the law, the commission may investigate and recommend readjustments; if these are not complied with, it may refer its findings to the attorney general of the United States for further action.

The legal form of organization of export associations varies; some are incorporated, others operate as ordinary associations by agreement. The looser and more elastic form has been given preference where an agreement on prices, terms of credit, allotment of orders and division of territory constitutes the main function of the association. The corporation form is generally chosen where a centralized sales system and a complicated technical and financial organization are required.

One incorporated association exports the manufactures of six stockholding companies, has a central selling agency, makes shipments and collections and remits the proceeds to the

producing members. Another incorporated association distributes orders on a percentage of quota assigned to each stockholder, taking into consideration manufacturing capacity, location, loading facilities and quality of products; operating expenses are covered by a sales commission. A certain unincorporated association, numbering eleven mills, allocates orders according to predetermined percentages and uses one of its members as the sole export agent. Another unincorporated association sells through an "export committee"; overhead expenses are prorated among the members on the basis of actual sales.

The total number of export associations in the period from 1918 to 1930 varied from 43 in 1920 to 57 in 1929 and 1930. There is no clearly marked trend toward an increase in their number, which is due in part to constant reorganization and consolidation. A number of associations have disbanded because of internal dissension, poor management, lack of business, unwillingness to cooperate, preference for dealing through export commission houses or absence of advantages expected under the new form of organization. Some associations, formed to meet temporary needs, dissolved in due time.

In 1931 export associations had a total membership of about 800 concerns, including mining companies, packing houses, mills, refineries, lumber companies and various manufacturing concerns, located throughout the country and with main offices generally at a seaport. The exports, mostly raw materials or semimanufactured products, included lumber, copper, zinc, iron and steel, machinery, railway equipment, sulphur, petroleum, rubber, paper, textiles, chemicals and foodstuffs. The total value of goods exported by the associations reached \$200,000,000 by 1926. Since then the value has been steadily increasing; it amounted in 1929 to \$724,000,000. While the exports handled by the associations do not constitute a very large part of total exports, in certain lines such as copper, zinc, lumber, sulphur, steel, oil and naval stores almost 100 percent of the export trade is under control of associations.

The experience of the past decade has revealed the typical handicaps under which the export associations often operate: unwillingness to abide by price agreements in times of business depression; competition of outsiders unwilling to join the association; disagreements over prices and allotments in an association whose members are of unequal size. Manufac-

turers who produce a variety of styles of goods do not readily lend themselves to collective marketing, and the joint marketing of branded goods frequently proves impracticable.

Despite these difficulties export associations proved helpful in steadily expanding old markets and opening new ones for American producers. Advantages claimed by the various associations include stabilization of prices by preventing underselling; reduction of overhead; standardization of grades, contract terms and sales practises; centralized inspection and consolidation of shipments; joint surveys and development of new markets; collective handling of claims; elimination of too liberal credit terms; provision of facilities for handling large orders, varieties of grades, styles and dimensions; united action against foreign competitors; higher business standards and resulting good will on the part of foreign customers.

Harmful consequences feared by the opponents of the Webb-Pomerene Act, such as dumping, unfair competition, blacklisting, enhancement of domestic prices and similar monopolistic practises, have, with minor exceptions, not developed. It is true that the growing tendencies to bring an entire industry into a single association, to combine large corporations and to act in concert with foreign combines may lead to arrangements injuriously affecting domestic markets and prices. The Federal Trade Commission is vested, however, with sufficient power to invalidate such arrangements and to prevent their recurrence.

EXPORT CREDITS. Prior to the World War the financing of foreign trade was left exclusively to private enterprise. The methods employed varied, depending on whether the transaction took place between countries of a homogeneous or heterogeneous economic structure. In the first case sales were financed exactly as in domestic trade, usually by short term notes or trade acceptances without any special financing through

banks. In the latter case, especially in overseas trade, a form of financing was developed by England, followed by Germany, which presented combinations of acceptance and documentary credit. A bank located in the country of shipment undertook through its foreign branch or its correspondents to collect the amount from the importer and on delivery of the documents advanced to the exporter an amount determined by the financial standing of the parties involved; or the bank gave its acceptance to a bill of exchange drawn by the exporter, which made the paper discountable. This form of financing attracted capital seeking short term investment, and London's importance still lies chiefly in the acceptance trade developed by its joint stock banks and private banking houses.

Governments rarely if ever participated directly in financing foreign trade. The cooperation of the government was largely confined to the enactment of legal provisions facilitating transactions of this kind by authorizing the bank of issue to rediscount the paper of the acceptance banks. Of course governments had many indirect ways of stimulating the flow of exports; for instance, by subjecting foreign loans to the approval of some governmental authority and making the assent to the loan contingent upon the placing of substantial orders with the domestic industries, or by so shaping the credit policy of the central banks of issue as to promote certain employments of capital and hinder others, or by the exercise of diplomatic pressure to secure orders from foreign governments. But these measures of government intervention were seldom motivated by purely economic considerations and are bound up with the larger problems of investment policy and imperialist expansion.

The conclusion of the war ushered in a period of increased export activity. It was stimulated by the necessity to dispose of large accumulations of raw materials and manufactured products of military importance, and by the desire to cement new political alliances by economic bonds. The notion then prevalent that speed was essential in securing a large share of the foreign trade of central European countries, whose competition in foreign markets was supposed to have been eliminated, was also a factor of some importance. The resumption of foreign trade, however, presented a credit problem unparalleled before the war. The countries in Europe most in need of large imports were stripped of capital and credit sources. On the other hand, the individual exporters were un-

able or reluctant to advance credit in view of the rapidly depreciating currencies of the importing countries. And finally the revolutionary developments in Russia and the general political instability of the post-war era resulted in a degree of uncertainty which so magnified the risk involved in foreign trade that private enterprise could no longer carry it. The stimulation of exports by official measures was also prepared for in both its administrative and ideological aspects by the war regulations of economic life and the discussions during the war of new post-war economic alignments, of which the Paris economic conference of 1916 offers perhaps the most characteristic example.

The first country to consider a plan of government export credits was Sweden, in 1917. Four years later Belgium provided a credit of 250,000,000 francs for a period of five years with the purpose of facilitating the export of Belgian goods, although only a fraction of the credit seems ever to have been used. Of wider scope and significance were the measures adopted in Great Britain. By the Trade Facilities Act of November, 1921, repeatedly amended later, the Treasury was empowered to guarantee the payment of interest and repayment of loans used to finance larger investments of capital at home or abroad which would provide business to British industry. The amount, set first at £25,000,000, was finally raised to £75,000,000; and March 31, 1927, was fixed as the ultimate limit for the granting of such credits. Although the greater part of these guaranties were applied to domestic trade, still about £18,000,000 was employed in the financing of exports. Also the schemes of the Unemployment Grants Committee of 1920 reacted favorably upon the export industries. Very important was the Overseas Trade (Credits and Insurance) Act of 1920 which was specially directed to the insurance of export credits. All these measures facilitated the restoration of disturbed trade conditions and above all enabled the banks to grant necessary advances to merchants on better terms.

In Germany the depreciation of currency acted as a powerful stimulus to exportation, and governmental assistance in export finance was resorted to only after the stabilization of Germany's currency. In 1924 the Deutsche Golddiskontbank was established with the special task of placing credits at the disposal of exporters at rates lower than the ordinary market rates. Its capital amounted to £10,000,000 sterling; of its authority to issue notes in English

currency, which was extraordinary for a German bank, it made no use. But it concluded credit agreements with foreign banks; above all, a rediscount credit of at first \$5,000,000 and then \$25,000,000 with the International Acceptance Bank of New York, which was repeatedly increased and in 1928 changed to a revolving credit of \$50,000,000 for a two-year term. Originally under the same management as the Reichsbank, the Golddiskontbank was given an independent existence in 1930. It specializes in intermediate credit. The financing of long term investments abroad is left to bank syndicates in cooperation with the Reichskredit-Gesellschaft, likewise a government undertaking.

The reopening of trade relations with Russia gave rise to increased governmental activity in financing exports. Trade with Russia involves special elements of risk growing out of the fundamentally different legal and political principles which serve as the basis of the Soviet state. In 1926 and similarly in 1931 the German government undertook to guarantee against loss to the amount of 60 percent of the purchase price distributed between the federal government and the member state concerned. Similar measures were taken by Austria and Italy in 1927, the latter hoping to increase her share in Russian orders as a result of the Anglo-Russian trade conflict, and later by France, Japan and other countries.

In the United States with the exception of the operations of the War Finance Corporation, which directly participated in financing foreign sales especially of agricultural commodities up to 1924, the services of the government consist only in having provided the legal framework for the development of new forms of finance under the auspices of the Federal Reserve Board. The Federal Reserve Act of 1913 as amended in 1916 and 1917 authorized member banks to accept drafts and bills of exchange growing out of transactions involving exportation and importation of goods and made provisions for rediscount with the Federal Reserve Banks. A further provision was made by the Edge Act of 1919, an amendment to the Federal Reserve Act, authorizing the formation of commercial banks performing functions relating to foreign trade, such as dealing in drafts, letters of credit, bills of exchange and bullion, and of investment banking houses dealing in foreign securities and issuing their own debentures secured by bonds and stocks of foreign corporations and governments. The Edge Act produced fewer establish-

ments than were at first expected. Also the Webb-Pomerene Act of 1918, which exempts the export trade from the operation of antitrust laws, acts indirectly as a stimulus to export trade by permitting the formation of export associations which in their collective capacity are in a stronger position to secure credit than the small individual entrepreneurs.

The system of export credits is one of the many manifestations of state interventionism in economic matters which followed logically the experiences of war economy. The credits granted by the governments, although amounting to only a fraction of total export credits, undoubtedly stimulate the exporting industries. They are in effect bounties in disguise, and the final report of the World Economic Conference of May, 1927, justly asserted that the indirect character of these subsidies "does not make it any the less necessary to lay stress on the hidden dangers inherent in this means of encouraging production and exportation."

EXPORT DUTIES are taxes imposed by the state on goods leaving its territory. They existed in ancient Greece and Rome and have been levied in England by prerogative of the crown from very early times. The first English statute to impose export duties was passed in 1275 and applied to wool and hides. From that time they came into rapidly increasing use throughout Europe both as a source of revenue and as a means of preserving the supply of grain and raw materials for internal consumption. By 1660 they had been imposed in England on 212 arti-

cles. In the seventeenth and eighteenth centuries export duties were largely confined to raw materials under the influence of mercantilist policies designed to encourage the export of manufactures. With the rise of free trade and with the increasing pressure of the producers of raw materials in the nineteenth century, export duties virtually disappeared in Europe. In England a century of earlier decline culminated in their complete elimination in 1842. By 1857 they had largely disappeared in France and eight years later in Prussia and Austria. In the United States they had long since been prohibited by the constitution, primarily at the insistence of the south, which feared lest its exportation of agricultural products be hampered.

In industrial countries the few export duties that have survived the nineteenth century and persist to the present time are limited to raw materials; they are intended to preserve the supply of raw material for the domestic producer and thus to give him a competitive advantage over foreign manufacturers. Examples of this type of protective duty are the export duties on cork in Spain and Portugal, on timber in Scandinavian countries and in Rumania and on rags and waste in various continental countries. A similar purpose is served by the tax on timber and pulpwood cut from crown granted lands in British Columbia, which is remitted if the materials are manufactured or used within the province, and by the tax on the export of power in Ontario. Sometimes export duties and export restrictions on raw materials are designed to conserve the natural resources of a country. The Canadian embargoes on pulpwood and the Swedish and Norwegian export duties on timber are said to be partly for this purpose, although the former is undoubtedly intended also to stimulate the development of the Canadian pulp and paper industry.

Some of the duties imposed on exported raw materials in colonies are also intended partly or wholly for the benefit of manufacturers or other business interests in the mother country. The usual procedure in such cases is to remit a part or all of the duty when the raw material is exported to the mother country. If the main purpose is to favor manufacturing the duty is remitted only in the event that the product is further processed in the mother country. Some countries, notably Portugal, impose such discriminatory duties primarily in order to aid national shipping, in which case the protective effect for home manufacturing is apt to be only

incidental. Preferential duties on colonial exports are characteristic of Portugal; they are used to some extent in certain colonies of France, Spain and Italy. British practises of the same character are exemplified in preferential export duties on tin ore in the Malay States and in Nigeria, on hides and skins in India and on palm kernels in British West Africa; the Indian and West African duties were in effect for several years after the World War but were subsequently abandoned. The remission of the Philippine export duties on shipments to the United States, which were abolished with the removal of the duties in 1913, served a similar purpose.

Of much wider application are the export duties levied by non-industrial countries and imposed primarily for revenue purposes. In such countries, particularly when levied on commodities produced largely for export, they are likely to be virtually a substitute for production or land taxes. They are easily collectible, and when imposed on commodities in the production of which there is extensive international competition they must be borne by the producers in much the same manner as any other tax on production. In some countries and colonies they are imposed on virtually all exports. Such is the case in Haiti, Salvador, Argentina, Uruguay, most of the Brazilian states, Peru, Arabia, Egypt, Irak, Syria, Albania, Portugal, Belgian Congo and in certain colonies of France, Portugal and Spain and a few minor British colonies. In general such duties are low, ranging from 1 to 5 percent; but in some instances they run above 10 percent.

More commonly, however, revenue export duties are imposed on certain products selected with a view to their revenue raising possibilities and taxed accordingly. If the commodity is one extensively produced in other countries the duty is apt to be kept low, since the burden cannot be shifted to foreign consumers and becomes a direct handicap to domestic producers in competing for export markets. If, on the other hand, the commodity is one of which the country imposing the duty has a monopoly or a quasi-monopoly, the burden of the duty tends to fall more largely upon foreign consumers. In such cases a high duty on a single commodity may be made to yield a large part of the total revenue of the country imposing it. An outstanding example of export duties of the latter type is the Chilean export tax on sodium nitrate, which for many years furnished something like half the total Chilean revenue.

When a high export duty is imposed on a raw

material produced largely in a single country, it may serve not merely to benefit the national exchequer but also to regulate exports with the object of stabilizing the price in the world market on a higher level to the advantage of the producers. The Chilean nitrate is a case in point. In Brazil the proceeds of the coffee export tax were used to finance the coffee valorization schemes. The export duties on British Malay rubber had only an incidental revenue purpose; they operated primarily as a restriction on rubber exports under the Stevenson plan.

The extent to which the burden of high export duties can be shifted to foreign consumers is generally subject to important limitations even for commodities in which the exporting country enjoys a partial monopoly. Competition from outside sources, either from the product itself or from some form of substitute, is apt sooner or later to administer a distinct check. Nor is the demand for any product likely to be so inelastic that possible reduction in consumption can be wholly ignored. In the case of nitrate the recent rapid growth of international competition from synthetic and by-product nitrogen has greatly curbed the power of the Chilean monopoly; in coffee the increase of production in outside areas has checked the Brazilian control; and in rubber the abandonment of the Stevenson plan in British Malaya in 1928 was due mainly to increased competition from the Dutch.

The termination of the World War was followed by a revival of both protective and fiscal export duties. The causes of this development must be looked for in the resurgence of economic nationalism and the resulting desire to reserve the indispensable raw materials to home industries as well as in the increased needs for revenue to meet the burdens left by the war. For a brief period export taxes were employed in countries with depreciating currencies like Germany, Austria and Poland to prevent these countries from being denuded of supplies, a condition made possible by the fact that the depreciation of their currencies in terms of foreign exchange was more rapid than the decline in their internal purchasing power.

The revival and extension of export duties and other export restrictions have been subjects of widespread international concern. In part this concern has been due to the barriers which along with import restrictions they have placed in the way of restoration of world trade. But in the main it has resulted from their use in connection with national monopolies or quasi-monopolies

of raw materials. As a vehicle for furthering the monopolistic exploitation of consumers in other countries they have been severely condemned both by individual governments and by international bodies. At the World Economic Conference in 1927 a draft Convention for the Abolition of Import and Export Prohibitions and Restrictions, prepared by the Economic Committee of the League of Nations, was endorsed by the conference. This convention subsequently obtained the official sanction of a large number of countries. But it did not cover export duties, was seriously weakened by a multitude of exceptions and was not ratified by a number of European countries where such restrictions were most prevalent. The Economic Conference also passed resolutions recommending that exportation of raw materials should not be "unduly burdened" by export duties or other taxes; that export duties on raw materials should never be imposed for the special purpose of placing foreign countries using such raw materials in a position of "unfair inferiority" as regards production of the finished article; and that whether used for revenue or to meet exceptional circumstances such duties should never discriminate between different foreign destinations. Except, however, for two multilateral conventions removing or reducing export duties on hides, skins and bones in about a dozen countries, no official international action has since been taken in respect to such duties.

EXPOSITIONS, INDUSTRIAL. *See* EXPOSITIONS, INTERNATIONAL; FAIRS.

EXPOSITIONS, INTERNATIONAL. The first international exposition was held in London in 1851, but it had its prototypes in countless similar events of more local significance. Between the middle of the eighteenth century and

the middle of the nineteenth century almost every country in Europe held exhibitions of national products. The factors which led to the increasing importance of regional expositions and which made possible their enlargement to international scope were the increase of materials and manufactured products to display and the development of transportation facilities. The possible advantages of international expositions were not at first apparent, however, and there was no lack of opposition when it was suggested that an exposition be held in London in 1851. It was the prince consort who urged the Society of Arts to sponsor an international exhibition, from which he thought English manufacturers and artisans would learn much. The opposition, vigorous and unrestrained in both houses of Parliament and among the public, held that England would be overrun with foreign rogues and revolutionaries and that the morals of the English and their loyalty to the crown would be endangered and coincidentally their trade secrets stolen. On the continent the reactionary governments back in the saddle after the turmoil of 1848 were reluctant to participate because their subjects might be infected first hand by English radicalism. But the prince and Queen Victoria were determined and even English insularity and obstinacy had to yield. The exposition—a one-building affair—opened on time in the great Crystal Palace built for it in Hyde Park and it was a great success. It did for England and her interests as much as Albert had hoped for, if not more. It closed with a surplus of £213,305, which was used to endow a museum at South Kensington, later called Victoria and Albert Museum. Not only did England learn about the arts and crafts of other peoples but continental visitors saw the superiority of English machine made goods. Lothar Bucher, the German publicist and Bismarck's secretary, has left testimony of what a revelation it was to him to see machines making furniture and other woodwork associated on the continent with slow hand labor. The opposition, which may be reckoned the last major outbreak of English parochialism, was silenced by the results. The necessity and advantage of education for workers, especially in the crafts and in technical fields, became a matter of national importance. The figures for British merchandise exported from the United Kingdom in the years just before and after the Crystal Palace exhibition seem to demonstrate its economic benefits, although other explanations are not wanting. In

millions of pounds these figures are: 1850, 71; 1851, 74; 1852, 78; 1853, 99.

The resounding success of the first world's fair encouraged imitation in many cities and lands. In the next seventy-five years were held over one hundred expositions which claimed to be international in character. Between 1862 and 1926 the United States government alone expended approximately \$30,000,000 as its part in over forty foreign and national expositions.

While the industrial displays remain of primary importance, other interests are also ministered to. The wonders of nature museum; international congresses; educational methods; transportation exhibits; the congress of religions; fine arts, science and agriculture displays—such features as these have been added to the display of present and past mechanical and industrial processes. The occasion for these expositions is usually the commemoration of some date of patriotic significance or perhaps the celebration of some significant achievement. Usually some important national purpose is served, either intentionally or indirectly, as the demonstration of Austria's recovery from the war of 1866 in the Vienna exposition of 1873; or the illustration of the growing economic and political power of the west in the Chicago exposition of 1893; or the post-war attempt to knit the empire together economically in the British Empire Exposition at Wembley in 1924-25; or the illustration of colonization activities at the French colonial exposition at Paris in 1931; or the attempt to exemplify ideals of national unity and achievement in the Chicago exposition in preparation in 1931. The Paris expositions of 1855 and 1867 were largely the result of Napoleon III's desire to strengthen his hold on the French capitalist group, to display the beauties of the Paris that Haussmann had remade and in general to keep Paris what the peace congress at the close of the Crimean War had indicated, the capital of Europe. The next Paris exposition in 1878 was a real proof, and so accepted at the time, that the Third Republic was definitely established and could stage an international exposition as good as the emperor's.

The reasons for such a flood of expositions during the three quarters of a century after 1851 may be found in certain dominant factors in this period. It was an age in which nationalism, national rivalries and national prestige were both realities and shibboleths. Behind them and giving them much of their reality were industrial and commercial development and expansion

and the desire to find more customers and to score new triumphs for local products. From this standpoint a world's fair is but an extension and sublimation of window dressing and display advertising, with its own rules and techniques: the first simple displays of finished products are followed by the better showmanship of machines in action, products being turned out on the spot by model miniature factory units. In addition there was the very considerable factor of metropolitan as well as national rivalries and ambitions. Paris and London, Vienna, Brussels, Amsterdam and Antwerp, Sydney and Melbourne—these cities and many others vied with each other for splendor and attendance. In America the list, and more amply the hearings before congressional committees, would indicate that no self-respecting city with an active chamber of commerce felt that it had arrived without having made a bid for a pretentious exposition of some sort.

In the United States when any given city aspires to exposition status numerous groups appear before congressional committees: the local chambers of commerce and real estate boards; the representatives of the railroads; the governor and the senators and congressmen, as representatives of the state. After the exposition when the reports are made and the returns calculated—since the first exposition in London there has usually been a real if not apparent deficit—the commission in charge considers many indirect gains, such as money spent by the visitors on hotels, food and other incidental expenses, new business that will come to that area and new values that have been added to real estate and factories. These are important factors, for the cities assume millions in obligations to be paid off later by taxes and their citizens contribute individually by buying stock that never pays out. One factor always present in the case of European cities is generally absent in America. The visitor to a European exposition is counted upon to return to see Paris or Vienna or Milan again with its permanent glories and then to see more of France or Austria or Italy. The perennial international tourist invasion has been increased by European expositions. In America only the Pacific coast cities could include such a factor in their gains.

These great expositions have had a strong influence on architecture, especially in America. In Europe too they have their place in architectural history through their introduction or more extended use of new materials and their

adaptation of old forms to new uses and to special settings. The London Crystal Palace of 1851 was planned by Sir Joseph Paxton, a landscape architect who had designed a notable greenhouse on the estate of the duke of Devonshire. The London building was essentially a great greenhouse, but it was a revelation of what could be done with steel and glass. The expositions in Paris, always in the center of a city which had its abiding and historic evidences of great architecture, were necessarily subdued to their surroundings and the limited area available in the center of Paris. Such structures as the Trocadéro built in 1878 and the Eiffel Tower in 1889 were much criticized departures. In the other and later continental expositions the modernists have had a freer hand but the results are seen most often in their influence on great factories and retail magazines, the chief fields in which new and elaborate structures have been required. In America it is hardly too much to say that the Chicago exposition in 1893 began a new epoch in American architecture. Its creation under the leadership of Daniel H. Burnham, with the cooperation of the ten leading architects of America, did much to end the Richardson regime of the Romanesque, already senile and degenerate in the hands of his unlettered imitators. The neoclassic style of the Chicago exposition set models whose influence can be traced in many public buildings and on university campuses. It opened the way for experimentation and the eclecticism that prevailed in American architecture for the next quarter of a century. The Transportation Building of Louis Sullivan on these same grounds was itself in striking contrast to the prevailing style and seemed to foreigners the harbinger of an American architecture of which the keynote was to be form adapted to function, a maxim that has given us the present architecture of the skyscraper. The whole creation in 1893 was a triumph of architects who were professionally trained in the United States and abroad, and their success gave a decided impetus to the establishment of university schools of architecture.

More widespread, more abiding and more significant is the vision of beauty brought to millions of eyes that had scarcely been lifted before from plow and prairie and wheels and whirring belts. America learned the value of beauty at Chicago, where the White City stood in contrast with the Black City (the Chicago of 1893), and again at San Francisco and St.

Louis and Buffalo and San Diego. It is not too much to say that the attempt to translate and preserve some part of these visions is partly responsible not only for the later civic plans of the cities where the expositions were held but also for the parks, boulevards, civic centers, public buildings and homes of the vast hinterlands that contributed the visiting millions.

The rapid development and frequency of international expositions—or of expositions that achieved international standing simply by inducing the national government of the day to extend invitations to other governments and their peoples—produced a problem. They became something of a nuisance. Governments were embarrassed and involved in expenses not in their plans when they conveyed an invitation. Manufacturers and producers were more and more reluctant to upset the orderly procedure of their factories by detaching producing units and granting a standing leave of absence to employees to move at considerable expense to successive exhibitions. The great industrialists who had made their names at earlier expositions and were secure in their leadership became less and less interested. Only the new firms with a name yet to make could be counted on to exhibit and they could not keep it up year after year. A badly managed exposition, a dubious system of making awards, an annoying experience with tariffs, a record of few sales or orders—all these diminished the zest for something that was good if there was not too much of it.

French exhibitors as early as 1884 formed a self-protective association, the *Société Amicale des Anciens Membres du Jury de Nice*, which was the forerunner of the *Comité Français des Expositions à l'Étranger*, founded in 1890. The latter was given legal status in 1901 by a law regulating all expositions in France and setting up conditions for French participation in foreign expositions. Similar protective committees were formed in Belgium (1903), Italy (1905), Germany (1906), the Netherlands (1906), Switzerland (1908), Austria (1910) and Japan (1911). In 1907 at the invitation of the French committee, an international federation of exhibitors, the *Fédération Internationale des Comités Permanents d'Expositions*, was formed in Paris to deal with regulations for making awards, securing safe return of exhibitions, protecting patents and similar matters. A German law adopted in 1904 and modified in 1925 regulates exposition practises so far as Germany's people and expositions are concerned. At the initiative of the

international federation sixteen European states and Japan signed a convention on October 26, 1912, in Berlin regulating the organization of international expositions. This convention was never ratified because of the outbreak of the war, and the international federation was dissolved. After the war, the institution of a series of new international exhibitions to reopen trade channels led to frequent conflict of dates and duplication within short periods of time of types of exhibitions. In 1925 the French committee tried to revive the work of the international federation but failed because almost all the national committees had become extinct. Thereupon the French government summoned an international diplomatic conference to deal with the problems discussed at Berlin in 1912. In 1927 the International Chamber of Commerce established a special Committee on Fairs and Exhibitions to draw up a draft convention. Thirty-eight nations were represented at the conference which met in Paris in November, 1928, to discuss this draft and the proposals of the French government. Of these, twenty-three signed a convention which came into force for a period of five years beginning January 17, 1931, having been ratified by Albania, France, Germany, Great Britain, Italy, Rumania, Sweden and Switzerland. This convention classifies the various types of exhibitions, provides for the avoidance of competition and duplication, establishes the duties of inviting and participating countries, rules for awards and other details of the conduct of exhibitions. An International Exhibitions Office has been established with its seat in Paris to follow up the problems discussed at the conference and to see that the provisions of the convention are carried out. The International Chamber of Commerce acts in an advisory capacity to this office.

Although doubt as to the value of international expositions has been expressed more and more frequently in the last twenty-five years, their significance during the latter half of the nineteenth century is less uncertain. In that period of the rapid development of a civilization in which applied science and technology were dominant factors each exposition could easily mark in some striking way a new stage in the progress of this type of civilization and its wide extension as nation after nation displayed its offerings abroad or arranged an international exposition on its own soil. At London in 1851 machinery took half the highest awards and England the majority of these. The "Virginia

reaper" of McCormick made its first successful bid for world fame at that exposition. In textiles and fine arts the British producer saw the foreigner take three fifths of the prizes. The German representatives of the Zollverein took home material for a three-volume report on the industries of the world, a significant guide for Germany as she began her career as an industrial nation. England found that she had something to learn and improved her technical education; the government spent \$250,000 at Paris in 1855 to help the British exhibitors and to publish for wide distribution the reports on the results. At London in 1862 the Bessemer process was publicly exploited and the possibility of rubber products revealed. At Paris in 1867 Germany taught the world something about the best gas motors and first revealed her leadership in aniline dyes. At Vienna in 1873 Japanese art made a strong impression on European art, to be reenforced three years later at Philadelphia. At the Centennial Exhibition in 1876 the telephone was a promising toy and the whole electrical display could have been put in a modest room. But American machinery, symbolized in the Corliss engine, won world attention at that time and Germany, whose exhibit in the words of their commissioner was "billig und schlecht," awoke to a realization of the market it was missing. Although Germany ignored Paris in 1878 and 1889 it made great displays at Chicago in 1893 and at St. Louis in 1904. As an illustration of how an exposition may found an industry or change it, one may cite the Fleischmann yeast display at Philadelphia as the beginning of a fortune; the introduction of the American public to Vienna bread was the work of a concessionaire. At Paris in 1878 the possibilities of electric lighting, refrigeration and motor vehicles were foreshadowed. By 1900 the automobile had become a display feature. Expositions have visibly operated toward change in social attitudes; e.g. after a nation wide controversy the Chicago exposition in 1893 was opened Sundays although only on condition that machinery should not be operated. In 1926 the need for more money led to the renting of the Philadelphia Sesquicentennial stadium for a great prize fight, with little public disapprobation.

The success of the attempts to make expositions an opportunity for the international exchange of ideas through congresses or conferences is difficult to appraise. Much has been claimed for them as epitomizing world thought

and forecasting social and intellectual trends. These congresses seldom measure up to the claims or the expectations of their promoters. The French expositions give special prominence to them, against backgrounds of exhibits to show progress in the fields of labor, social economy and education, and have in general been more successful than others in this respect. Labor and its conditions have been perhaps the most emphasized. The visit of French laborers to London in 1862 is the alleged basis for the First International of Marx and Engels formed in 1864 and dissolved in 1876 at the time of the Centennial Exhibition in Philadelphia. The chronology of expositions and wars minimizes any claim made for expositions as major contributors to peace.

The day of the international exposition may have passed. Many think that there will be no more in the grand manner and that henceforth they will be specialized along certain lines, such as electricity, automobiles and the graphic arts. This is quite possible, for a true universal exposition which seventy-five years ago could be put under one glass roof in Hyde Park is today an impossibility within the area and resources available in or near any truly metropolitan center. But in post-war Europe there are many new nations and in Africa and Asia new frontiers of civilization that will wish to exhibit to the world their industrial and cultural achievements; new industries and improved products are still seeking markets; despite their experiences of loss older nations may find themselves impelled toward a public stock taking. Perhaps after all it is too early to write finis to international expositions either universal or special.

EXPRESS COMPANIES are an economic development peculiar to America. In practically all European countries the railroads or the postal systems, often in conjunction with collection and delivery agencies, cover the field served by express companies in the United States and Canada. That field may be described roughly as transportation of merchandise by railroad or steamboat at passenger traffic speed, together with pick up from the consignor and delivery to the consignee. In contrast to the parcel post, express companies impose no limits on the size or the weight of the merchandise they transport or on the insurance applicable to it. It follows that most articles sent by express are those which go long distances or are highly valuable or have great weight or bulk or cannot readily be conveyed to a post office or by their nature require delicate handling. Express rates are on the whole lower than parcel post rates for the heavier articles and for the longer distances, and occasionally compare favorably with railroad freight rates on very bulky but light weight articles, so that these often go by express rather than by freight.

Express companies also render special forms of service not directly connected with express service as such. They issue their own travelers' checks and money orders, sell goods on commission, transfer money by telegraph or cable, maintain travel offices and perform other banking, tourist and commission functions. In 1929 the gross revenues from these non-transportation operations amounted to \$3,672,626, or slightly more than one percent of the total gross revenues of express companies.

Stagecoach drivers and passengers had for many years carried and delivered packages and executed commissions in an informal way, and almost as soon as railroads were developed in the

United States railroad employees and passengers were importuned to transport small or valuable articles from one city to another. Certain individuals soon began to demand fees for this service, hired assistants, arranged with the railroads for special space on trains and opened offices. Beginning with the late thirties express was developed rapidly over railway routes. Where railroads had not yet penetrated, steamboats often served to carry express; and in the west stagecoaches were used, especially for bullion. During the fifties many consolidations took place, so that most of the express business was decimated by a few companies, and for several decades prior to the entrance of the United States into the World War the bulk of the express service of the country was handled by five companies: the Adams Express and its subsidiary, the Southern Express, operating in the east and middle west and over several western routes; the American Express in the east, middle west and trans-Mississippi region; the United States Express in the east outside of New England and in the middle west and over several western routes; and the Wells, Fargo & Company's Express in the far west and the southwest and over several eastern routes.

According to the first federal census of express companies which was taken in 1890 a total of eighteen companies operated over about 175,000 miles, of which 160,000 were by railroad. 93 percent of this mileage was controlled by the five major systems mentioned above and by the Pacific Express Company, which was organized in 1879 by the Gould group of railroads and was absorbed in 1911 by Wells-Fargo express. The total number of express shipments in 1890 was 115,000,000 and the companies' expenditures were \$46,000,000. It is significant of the period's attitude toward public utilities that the companies' receipts were not reported in the 1890 census.

The standard contract between express companies and railroad companies provided that the former were to pay the latter a fixed proportion, usually in the neighborhood of 50 percent, of the gross charges for transporting the express merchandise. There was considerable interlocking of directorates and securities ownership between the express companies and the railroads.

In 1906 the Hepburn Act gave the Interstate Commerce Commission enlarged powers over the railroads, and the express companies were included in the scope of the act. Subject to review by the federal courts the commission was

empowered to fix express rates after complaints were made and was given full access to the express companies' books and power to order a uniform accounting system. The Mann-Elkins Act of 1910 shifted the burden of proof as to the fairness of rates to the companies and allowed the commission to act of its own volition in express rate rulings. Soon afterward these rulings were made subject to review only by the Supreme Court after consideration by a special court of three federal judges. Classification of express traffic likewise was entrusted to the commission.

In 1913, in spite of the vigorous opposition of the express companies and other groups, a parcel post was finally made a part of the postal system. Prior to this four pounds had been the upper limit of parcels sent through the mails. The express companies feared the potential competition of the new service, and rather than compete the United States Express Company decided to cease operations and went out of existence in 1914.

An investigation by the Interstate Commerce Commission in 1922 indicated that the parcel post had attracted most of the smaller packages. It was found in that year that the average weight of an express shipment was eighty-two pounds, whereas in the years before 1913 it had been thirty-four pounds. There is frequently, however, more than one package in an express shipment. In 1929 the average weight of an express shipment was probably about the same as in 1922, while the average weight per parcel post package was only slightly more than five pounds. In 1931 the Railway Express Agency reported that in 1929 it had handled 177,505,448 shipments of all classes and weights. This figure may be compared, remembering that express shipments frequently are composed of more than one parcel, with 837,308,320 pieces of parcel post mailed in the fiscal year 1929-30.

It must be added that the cost accounting figures of the Post Office Department show that the parcel post in the fiscal year 1929-30 was conducted at a net loss of \$15,570,731. This was about 10 percent of the gross parcel post revenues for the year. The deficit was ascribed to parcels mailed in the first three zones, covering distances up to three hundred miles. Parcels mailed in the other zones showed slight profits. Accordingly, the postmaster general late in 1930 filed application with the Interstate Commerce Commission for approval of an increase in rates for parcel post packages for the shorter distances and of a decrease for the longer distances. He

requested also approval of an extension of the upper weight and girth limits upon parcel post packages. Execution of the proposed changes would naturally intensify the competition between parcel post and express service.

Slightly more than a year after the United States entered the World War the Wilson administration decided that the express service of the nation could be rendered most effectively by unification. On May 28, 1918, the United States Railroad Administration made public an agreement with the four leading express companies for their amalgamation into the American Railway Express Company. The new company was capitalized for only \$34,640,000, the value of its actual property and cash, and capital stock was issued for that amount. The activities of the company were to be administered by the Railroad Administration, which was to receive 50½ percent of all gross express operating revenues. The 49½ percent remaining to the express company was to cover operating expenses, taxes and a 5 percent dividend on the capital stock. Of any profits remaining, the first 2 percent was to be divided equally between the company and the Railroad Administration; the next 3 percent, one third to the company and two thirds to the Railroad Administration; of all further profits, one fourth to the company and three fourths to the Railroad Administration. On November 18, 1918, President Wilson issued a proclamation establishing federal possession and operation of the American Railway Express Company. It was announced that the action was taken to make the government's control over the company indisputable.

The express service was returned to private hands on March 1, 1920. It continued to be unified in the American Railway Express Company, which became a private agency and was exempted by act of Congress from the scope of the federal antitrust laws. The government guaranteed the company against a deficit for the following six months. At the end of that period an increase in rates was granted by the Interstate Commerce Commission. The company made new contracts with the railroads which changed the basis of payments; operating expenses were made the first charge against operating revenues, and 2½ percent of the resulting net income was to go to the express company. The principal reason for this small percentage is that express collections are considerably greater than the capital invested in the express service. This situation obtains because the most expensive

part of the service is rendered by the railroads. The capital equipment which must be maintained by the express companies consists only of express cars, delivery trucks, depots, land and the like. In recent years the value of this equipment, less depreciation, has been fixed at between \$30,000,000 and \$35,000,000, only slightly more than 10 percent of the average annual express revenues. The 1920 contracts specified further that if the percentage which went to the express company became more than 6 percent of the capital of the company, one half of such excess was to revert to the railroads; and if the percentage became greater than 10 percent of the capital, the railroads were to receive three fourths of that excess.

In 1921 the Southeastern Express Company was organized. It is owned by the Southern Railway system and operates almost exclusively over that system's lines. In 1929 it accounted for about 4 percent of the express mileage of the country and for not quite 3 percent of all express collections.

The business of the American Railway Express Company failed to expand after the period of federal control. Its collections amounted to approximately \$291,000,000 in 1922, \$285,000,000 in 1927 and \$283,000,000 in 1929. In opposing the proposal for a change in parcel post rates the Railway Express Agency in 1931 estimated its total collections for 1930 at less than \$245,000,000. This lack of expansion is but an index of the decline in importance of the express service which had been going on for some time. As railway systems grew in size, car interchange was developed and service was generally improved, the need for express companies as coordinating agencies for expeditiously carrying certain classes of traffic over a number of small, non-unified railroads declined. The lack of expansion has undoubtedly been due also to the increase in transportation by motor truck. The Interstate Commerce Commission has at present no control over the extensive and rapidly growing motor truck service, and reliable statistics upon it are lacking. Proposals for federal control of interstate busses and trucks were brought forward in the Seventy-first Congress in the Parker-Couzens bill, but federal control was visualized primarily as a court of sanction and as a last resort for cooperative control by the several states. By 1931 the state statutes on motor trucks were still concerned primarily with taxation and with safety, and motor truck rates, especially interstate rates, re-

mained for practical purposes unregulated by legislation.

This transportation of commodities by trucks was meeting, at least partially, one of the weak points in the service rendered by the private express system. That system could tap only territory adjacent to the railroads or to waterways and was not available to the large proportion of the population distant from rail systems and navigable waterways. This fact had been stressed in 1912 by those who urged, unsuccessfully, that the parcel post when established should offer pick up service at a fee and should have no limits, or extremely generous limits, as regards weight, girth and insurance.

The post-war motor truck, however, like the parcel post, has become available to most people who live on or near passable roads. In some instances it provides interstate service on regular schedules; in others, on occasion or by order. It generally also makes available the local haulage of commodities. By 1931 it was known that an increasing amount of milk and farm produce had been diverted from the express service to the motor truck, and the same diversion was apparent in manufactured merchandise.

Express companies were also keenly feeling the competition of fast freight service by rail, which for a number of years was being improved and expanded. Fast freight between certain points was being dispatched on regular schedules; special fast freight trains, although required to yield the right of way to passenger and express trains, were given the right of way over ordinary freight. One effect of this development was to enable shippers to maintain smaller inventories, secure in the knowledge that they could obtain raw materials with less delay and deliver their products more speedily. Merchants likewise could rely upon this new service if they allowed their stocks to become low. Yet it had been for this very purpose of maintaining smaller inventories that many manufacturers and merchants had patronized the express service. After 1920 railroad companies tended to favor shipment by fast freight of such bulky commodities as oysters, milk and fresh fruit, which had formerly been carried as express, and to restrict express traffic to parcels.

The railroads developed fast freight in part to protect their freight tonnage against motor truck competition, and in addition were seriously considering delivery and even pick up of freight. The first diversion of freight to motor truck was mostly of short haul traffic, which the railroads

are apt to consider the least profitable freight; but more recent diversion has been of longer haul traffic and has affected rail profits more sharply. Fast freight on regular schedules with delivery and pick up service would compete sharply with express and indeed might be considered a slower express service.

Container freight service also was being rapidly developed. In this service freight cars were fitted to hold uniform steel containers not unlike lockers. The shipper could pack these containers in his own establishment and deliver them locked to a freight depot, where cranes loaded them upon the freight cars waiting for them. This service lent itself readily to the shipment of fragile or valuable articles, which had formerly been considered peculiarly the province of the express service.

Finally, the railroads were complaining that under their contracts of 1920 and 1923 with the American Railway Express Company they were obtaining an insufficient proportion of the express revenues. If the express service remained in private hands, the Interstate Commerce Commission might be successfully appealed to in a move to prevent the development of fast freight to the point of destroying all express profits. If the express service were made part of the railroad systems, the railroads could well afford to develop fast freight at the expense of express, inasmuch as most of the rail revenues came from freight and only a relatively small proportion from express payments.

Under these circumstances the railroads intimated that they would not renew the 1920-23 arrangement when the contracts expired on February 28, 1929. On that date, with the approval of the Interstate Commerce Commission, the American Railway Express Company was taken over by the Railway Express Agency, which was empowered to issue stock to the amount of \$32,000,000, the estimated value of its capital equipment. The stock was bought by the several railroads of the country in proportion to the amount of express traffic which had been hauled by each road during the preceding years. The machinery of express administration remained the same.

In Canada also there has been a marked tendency for express service to be concentrated in a few companies and for its control to pass to the railroad companies. In 1927 Canadian express companies had a gross operating revenue of \$25,736,275 and had 5068 employees. The greatest part of the service was performed by the

Express Companies — Extension Work, Agricultural 31

Canadian Pacific Express Company (formerly the Dominion Express Company), a subsidiary of the Canadian Pacific Railway, and by the express department of the Canadian National Railway.

In 1929 the interstate express companies of the United States—the American Railway Express for the first two months, the Railway Express Agency for the last ten months and the Southeastern Express Company for the full year—showed a total mileage of 270,890, including 232,093 over railroads, 23,612 by steamboat and 10,314 by airplane. The number of employees on December 31, 1929, was 59,468, with an average daily compensation of \$5.66. Some financial statistics for the same companies in 1929 follow:

Transportation revenues . . .	\$291,326,777
Contract payments for express privileges	150,044,944
Interest on funded debt . . .	1,334,000
Net income	474,248
Dividends declared	589,630

EXTENSION WORK, AGRICULTURAL. Agricultural extension work is a term which may be applied to a variety of forms of extension education in agriculture and home economics. In the United States formal cooperation between the United States Department of Agriculture and the Land Grant colleges in the provision of such extension education on a national scale was inaugurated by the act of Congress of May 8, 1914, commonly known as the Smith-Lever Act. Equally recent has been the expansion on a large scale of organized agricultural extension work by European governments. But the real beginning of informal extension teaching in agriculture may be traced to a much earlier date. The many agricultural societies which were organized in both Europe and the United States after the middle of the eighteenth century as a result of the growing interest in new agricultural techniques were as much concerned with the dissemination of information as with investigation and experimentation. American statesmen such as Washington and Jefferson devoted much time and money to the importation of seed and improved livestock and to the popularization of their use. The agricultural fair, the foundation of which was laid by Elkanah Watson in 1807, was throughout the nineteenth century an important organ for the spread of knowledge in regard to agricultural techniques. During the same period an increasing number of agricultural schools and lyceums were conducting lectures and farm tests.

But although fairly numerous instances of public demonstration lectures conducted by agricultural societies and after 1850 by state boards of agriculture can be found, all such extension work remained sporadic and limited until the third quarter of the nineteenth century. The crude methods of agriculture inherited from previous centuries were adequate to an expanding pioneer system. Moreover, scientific agricultural experimentation did not develop on a large scale until after the middle of the century. The period following the Civil War was one of agricultural depression, in which the attention and efforts of farmers were directed to political agitation and protest. The early militant Grange, the Greenback movement and the free silver question all represented the reactions of the agricultural groups to the pressure of widening markets, the impinging of commercialization and the growing disparity between rural and urban standards of living. With the failure or subsidence of such political movements there

EXTENSION WORK. See **EXTENSION WORK, AGRICULTURAL; UNIVERSITY EXTENSION.**

set in a period of renewed and increasingly active interest in agricultural education. The creation of the United States Department of Agriculture in 1862 provided the basis for future work; the organization of state agricultural colleges under the Morrill Land Grant Act of 1862 and the development of experiment and research work in these colleges under the Hatch Act of 1887 assured the rapid growth of a new body of scientific facts relating to agriculture and provided at the same time means for dissemination of such information.

One of the most important methods of extension education fostered by the agricultural colleges and state departments of agriculture was the farmers' institute. The Kansas Agricultural College is generally credited with having held the first such institute in 1868. The movement spread rapidly and soon agricultural colleges and societies throughout the country were organizing such local meetings of farmers, lasting from one to three days, at which professors from the colleges and specialists from the departments and successful farmers lectured on subjects relating to the technique, and sometimes to the business, of agriculture. Occasionally women lecturers carried special messages to the farm women. After 1880 an increasing number of states supported the farmers' institutes with definite appropriations. In 1896 a national body, the American Association of Farmers' Institute Workers, was organized to coordinate the work. After 1901 the Federal Office of Experiment Stations received special appropriations to support the work. In 1914 there were held in the whole country 8861 institutes with an attendance of 3,050,150 persons. Farmers' institutes were undoubtedly of great value in the spreading of knowledge in regard to new and improved methods of agriculture and of home making. Their greatest defect was that they occurred so infrequently, often only once a year, that it was difficult for the farmer to follow up the ideas he received. With the passage of the Smith-Lever Act and the setting up of a national extension system based on the work of the county extension agent the farmers' institute lost much of its importance, and the agricultural colleges and state departments of agriculture gradually transferred their support to the county extension agents. In 1920 there was a marked revival of one-day institutes, but since then the whole movement has gradually declined in importance.

Influenced by the Chautauqua movement and by the British university extension systems, the

agricultural colleges shortly after 1890 began to develop a variety of other forms of extension work. Organization of reading and correspondence courses in agriculture and home economics, the publication of bulletins in technical subjects, the holding of field demonstrations and the support of itinerant lecturers and movable schools all became recognized features of extension education.

The development of a body of trained teachers and lecturers increased the enthusiasm among those in touch with the situation for a further and more systematic development of extension work. Moreover, the growth of extension work was placing such a burden on the agricultural colleges that their resident teaching and research tended to suffer; there was therefore a demand for special federal appropriations for extension work. By this time the experiment stations were accumulating new techniques at a rapid pace; the perfection of agricultural machinery presented new problems in the education of the farmer; and the growing dependence of agriculture upon the market was making more evident the inability of the individual farmer or even the individual farm community to handle many of the most pressing problems alone. Increasing attention was given to education in farm management as well as in farm methods, and after 1900 agitation for nationally supported and organized extension work grew rapidly. It was augmented by such factors as the report of President Roosevelt's Country Life Commission calling attention to the need for a more satisfactory rural life.

It was such agitation which resulted in 1914 in the passage of the Smith-Lever Act. But the basic method of extension organization embodied in that act resulted not from the theoretical discussion of needs but from a plan developed to combat a threatened national calamity. About 1898 the cotton boll weevil began its devastation of the cotton fields of Texas. It quickly became apparent that the pest could not be eradicated, and the principal agricultural crop of the southern states was threatened with destruction. Methods of successfully cultivating cotton in spite of the presence of the boll weevil had been developed; the problem was to persuade a large number of farmers to adopt them. In 1904 Dr. Seaman A. Knapp, who had been cooperating with the United States Department of Agriculture in experimenting with the demonstration farm plan in Louisiana, was called into conference with Secretary of Agriculture Wilson

and other department officials who visited the devastated cotton fields of Texas. To this group Dr. Knapp explained his conception of adult education, which involved not simply teaching by object lesson but having the farmer himself make the demonstration rather than merely witness it. He was immediately put in charge of such demonstration work for the department; in February, 1904, the first extension agents were appointed, but their work was not at first confined to a single county. The first county extension agent was appointed in 1906. With this organization Dr. Knapp began by directing his efforts to combating the devastation of the cotton boll weevil, to the growing of substitute crops and to the use of fertilizers and improved tillage.

In 1906 this work attracted the attention of the General Education Board established by John D. Rockefeller in 1902, which was at the time operating in the southern states. Arrangements were effected whereby the work of the Board was coordinated with that developed by Dr. Knapp under the Bureau of Plant Industry. At first the work was directed exclusively toward education of the adult farmer, but soon boys' clubs, particularly corn clubs, were organized and demonstrations carried on through them. Somewhat later similar work was started with girls; the first woman county home demonstration agent was appointed in 1910. The success of these activities in the south attracted national attention and within a few years the method spread into the northern states, notably into Illinois, Missouri, New York, New Jersey, North Dakota, Ohio and Utah. The first county extension agent outside of the southern states was appointed for Uintah County, Utah, March 1, 1911. In the same month work was started in New York in a district comprising parts of several counties adjacent to Binghamton. By 1914 county extension agents to the number of 1138 were at work in the southern states and about 209 had been appointed in the states outside of the cotton belt.

The essential feature of the county extension agent system is the permanent location in a definite territory of a trained agriculturist concerned with organizing programs and devising methods for improving conditions in that district. Appointed at first by state boards of agriculture and agricultural colleges, the county agent maintained close relations with both agencies, using all their facilities of special lectures and courses to supplement his personal work.

From the beginning the county extension agents sought the cooperation of local committees and local farmers' organizations. Especially in the northeast and north central states the county agent method as it developed relied upon county farmers' associations for support and used them to give a community aspect to the work. These associations were organized on a variety of bases and with various names, such as soil and crop improvement associations or farmers' clubs, but gradually the general name for all of them came to be Farm Bureau. Many of the states, by act of the state legislature, made the organization of such a farm bureau a condition precedent to the establishment of extension work in a county. It was these county farm bureaus which after the World War formed the basis of a new national farmers' organization, the American Farm Bureau Federation.

The agricultural extension act (Smith-Lever Act) of May 8, 1914, made this system of county agents and their supporting organizations the basis of a national system of extension education in agricultural and home economics. The act provides a legal basis for cooperation between the United States Department of Agriculture and the Land Grant colleges in the establishment and support of the system; to this end it appropriated \$10,000 to each state and provided for the granting of additional sums contingent upon appropriations from within the state. The amount of funds available has been increased by supplemental legislation of succeeding congresses; the Capper-Ketchum Act of 1928 allotted \$20,000 to each state and also provided for additional funds to be offset by state appropriations. In 1930 the total funds available for agricultural extension work in the United States amounted to \$24,257,800, of which \$9,251,760 was provided by the federal government, \$6,948,450 by state legislatures and \$8,057,591 by county and other sources. Before 1914 private sources, foundations or local organizations provided considerable sums for extension work; in a few middle western states this is still the case, but the tendency is toward complete public support. The Smith-Lever and other extension acts were made applicable to the territory of Hawaii July 1, 1928; and the Smith-Lever Act, to the amount of \$10,000 only, to Alaska on July 1, 1930. The extension acts are effective for Porto Rico beginning July 1, 1932.

In order to insure coordination of extension work on a national scale the Smith-Lever Act provided that the agricultural colleges receiving

funds should submit to the secretary of agriculture plans for their work and a proposed budget. The effective operation of the act required a more definite formulation of relations between the United States Department of Agriculture and the agricultural colleges. Within the United States Department of Agriculture itself the administration of extension work was centralized under the States Relations Service, to which were transferred the office of Experiment Stations (except irrigation and drainage investigations) and the farmers' cooperative demonstration work previously in the Bureau of Plant Industry. An agreement was reached with the states that one state agricultural college in each would receive all the benefits from the act and that this college should establish a separate division of extension work, the director of which, selected by the college and acceptable to the Department of Agriculture, should plan the extension activities for the entire state. County and home demonstration agents became federal civil service employees.

With the entrance of the United States into the World War a new importance attached to the work of the extension service. It was called upon by the Food Administration to direct the work of increasing and mobilizing food supplies; home demonstration agents carried the burden of fostering food conservation. With the use of special emergency appropriations additional extension workers were appointed in great numbers. At the end of the war there was a period of difficulty as local cooperating organizations were disbanded and it was uncertain how large a force of extension workers could be maintained. But the extension service was too firmly established and too urgently needed in the disturbed post-war years to suffer any real loss of importance. Certain administrative reorganizations within the Department of Agriculture further unified the work and extended its scope. On June 30, 1930, a total of 6113 men and women were employed in agricultural extension work. Of these, 191 were in the department in Washington and 488 in administrative or supervisory positions in the states; there were 2580 regular county agricultural agents and assistant agents, 1225 county home demonstration agents and assistants and 246 county boys' and girls' club agents. In addition there were 172 Negro county agricultural agents and 127 Negro county home demonstration agents. County workers thus comprise about two thirds of all cooperative extension workers. One connecting link

between the research institutions and the county extension agents is the state extension specialist. In 1930 there were 1100 such state specialists in dairying, poultry, soils, horticulture, agronomy, nutrition, clothing, home management, farm management, forestry and other similar subjects.

This growing organization has continued to make use of all the devices developed in earlier years—demonstration work, circulars and bulletins, lectures and more recently moving pictures and the radio. The Department of Agriculture decided that Smith-Lever funds could not be used to support farmers' institutes, short courses at colleges or correspondence courses; in some of the states, however, state funds have been used to continue such work through the agricultural colleges.

A phase of extension work deserving particular mention is the work with boys and girls, usually called 4-H Club work. Young people between the ages of 10 and 20 are admitted to such clubs and the majority of the members, who totaled approximately 800,000 in 1930, are under 14 years of age. Organized by the county agents and directed by adult leaders, these clubs engage in poultry raising, gardening, dairying, food preparation and projects for home improvement. Through contests with awards of prizes and trips and through special camps an effort is made not only to give the children scientific information in regard to agriculture and home economics but also to develop an appreciation of country living under proper conditions. The work of the home demonstration agents with farm women has also been of growing importance in this direction.

In the work of the county agricultural agents the emphasis has been upon improvement of crop and livestock production, primarily because the great mass of research work carried on by the experiment stations, the agricultural colleges and the United States Department of Agriculture has been in that field. Educational work in relation to the farmer's business life was contemplated by the Smith-Lever Act and was approved by Secretary of Agriculture Houston in the first year of its operation. There was little research in this field, however, and consequently little in the way of accepted principles to guide extension procedure. An office of Farm Management was organized in the Bureau of Plant Industry in 1906, but its activities developed slowly. From the beginning, however, many county extension agents gave advice in

regard to business conditions. Since the war there has been an increasing demand from farmers for such service. In addition to teaching methods of farm management the extension service has attempted to develop a basis of farm accounting and secure its widespread adoption. The agricultural outlook reports of the Department of Agriculture furnish a possible basis on which farmers can readjust farm production. The passage of the Agricultural Marketing Act of 1929 creating the Federal Farm Boards stimulated work in the field of cooperative marketing. Increasing emphasis has been laid by extension workers on the encouragement of cooperative marketing associations. There is evident in the service an attempt to coordinate extension work in production, distribution, farm management and ways of living.

Agricultural extension work in other countries has developed along slightly different lines. Except in England it is ordinarily undertaken directly by government departments or by farmers' organizations subsidized by the government rather than by the agricultural schools and colleges. Although agricultural colleges and secondary schools have existed in most European countries since the eighteenth century and experiment stations have been established in large numbers, it is only since the World War that extension work has developed on a large scale. The pressure of food supply problems during the war and the subsequent dislocations of international trade led to a marked expansion of all forms of agricultural education and particularly of extension work throughout Europe. While the basis of organization of such work differs in each country, there is considerable similarity in the methods employed. In general there is more emphasis on movable schools, short courses, lectures and demonstration farms and less on demonstrations by farmers themselves than in the United States. The motion picture and the radio have been brought into use to spread agricultural information, and the specialist in every branch of agriculture plays an important part in the extension work of most governments. In the majority of the countries the government works through farmers' organizations and definitely encourages the formation of cooperative and other associations.

Special features of extension work in certain countries may be noted. In England there is a system of county agricultural organizers, who give lectures and organize conferences. In many cases they are supported by farmers' discussion

societies. The work of the women's institutes is closely allied to extension work, and young people's clubs are multiplying in number. Much use is made of scholarships. These activities are coordinated by the National Council of Social Service, a central board for all rural councils, which includes representatives of the Ministry of Agriculture. In Sweden and Norway too extension work is organized through county agricultural societies and definitely tied up with other work for small holders. In Italy itinerant schools are organized by the central government and provincial authorities. In Germany experiment clubs have been organized and extension work fostered by the chambers of agriculture. In France an important feature of extension work is its definite use to check the emigration of the rural population to the cities. In Denmark the Royal Agricultural Society centralizes extension as well as all other agricultural education; the work has long been developed to a high degree of specialization throughout the country. Extension work is well developed in the British dominions, especially in Canada, South Africa and Australia. Most of the South American countries have governmental systems of itinerant agricultural advisers. There is a small amount of extension work in China but in Japan it is highly developed. In 1922 it was estimated that 1,190,000 individuals in Japan received extension instruction. Soviet Russia is carrying on agricultural extension work on an unprecedented scale. All the ordinary methods of instruction in improved agricultural methods—lectures, demonstrations, motion pictures, radio—are supplemented by the most ambitious demonstration of the nature of modern socialized agriculture.

The world wide growth of extension teaching, supplementing scientific experimentation, has revolutionized the technical basis of agriculture. Over wide areas primitive methods are being supplanted by improved methods of tillage. The standards of living of rural communities have also felt the effect of this new educational method. But the larger task of giving to agriculture its place in a balanced economic system still remains a challenge to the extension workers of all countries.

EXTERRITORIALITY

GENERAL. Extraterritoriality (extraterritoriality) is a legal fiction or metaphor serving to explain the special immunities attaching to the persons and to the habitations of diplomatic agents, who are not subject to the jurisdiction of the country of official residence and thus in a sense are to be regarded as outside the territory: *extra territorium*. This fiction was originally suggested by Grotius in *De jure belli ac pacis* (bk. ii, ch. xviii, sects. 4-5) and the term *extraterritorialitas*, or *extraterritorialité*, was first employed by Wolff and von Martens in the eighteenth century. It is also applied to troops in peaceful transit over foreign territory and to public vessels in foreign ports.

The term extraterritoriality has become identified specifically with the status of foreigners enjoying special immunities from local jurisdiction. Phoenicians possessed extraterritorial privileges in Memphis as early as the thirteenth century B.C. Foreign merchants in Spain were allowed to have their own magistrates in the fifth century A.D. Special privileges were accorded to Arabs in Canton, China, in the ninth century, to Russians and to Venetians in Con-

stantinople (where they are known as Capitulations) in the tenth century, to Genoese in the same city in the thirteenth century, to French in Egypt in the thirteenth century, to Italians in London as late as the fifteenth century and to the Dutch and British trading "factories" in Japan in the seventeenth century. In some places, such as the Venetian and Genoese suburbs of Constantinople, foreigners were permitted to have separate autonomous communities. Treaties signed with leading western powers by Turkey, China, Japan, Siam and Persia during the nineteenth century set up systems of extraterritoriality in each of these countries.

The origin of these extraordinary privileges, which were as a rule granted freely, is to be found in the early concept of law as being personal rather than territorial in nature. It was held to follow a man wherever he went. Inasmuch as this personal law was rooted in diverse legal, religious, social and moral usages, no universal principles of jurisprudence could be applied readily to all alike. It was therefore more logical, practical and conducive to harmonious intercourse to permit foreigners domiciled in the midst of alien peoples to be judged according to their own laws. Originally extraterritoriality was a subject of municipal law and the system was not regarded as a limitation on territorial sovereignty.

This fiction or metaphor of extraterritoriality is inaccurate and misleading. Foreigners enjoying these privileges, even if residing in separate communities, cannot actually claim the same rights as if they were residing *extra territorium* within their own national territory. It is obvious that the title to land, the interchange of goods and other property, inheritance, marriage, divorce and many other matters are subject to the *lex loci*. The United States Supreme Court has weakened the fiction by holding that American consular courts are created by special legislation and administer justice according to executive regulations. The Constitution of the United States does not extend *extra territorium* and there is no right of trial by jury before such tribunals [in re Ross, 140 U. S. 453 (1891)]. Foreigners enjoying so-called extraterritorial rights are subject to restrictions which vary according to the treaties or special grants giving these rights. It would therefore be more accurate to define their status as being the enjoyment of certain immunities of jurisdiction. The term extraterritoriality, however, has become consecrated by long usage.

The term extraterritorial is also used in the sense either of the extraterritorial effect of legislation over nationals abroad or of the right of jurisdiction over acts committed outside the territory by nationals or foreigners. The right of a state to legislate concerning its nationals abroad, notably in such matters as taxation, military service and jurisdiction over privately owned merchant vessels flying its flag on the high seas, has been generally recognized. The right of a state to jurisdiction over acts committed outside its territory either by its own nationals or by aliens has by no means been recognized, except in such cases as conspiracy against the safety and sovereignty of the state or serious crimes where the constructive presence of the accused on its territory at the time of the criminal act is assumed, e.g. shooting across the boundary. The decision of the Permanent Court of International Justice in the *Lotus* case, however, which concerned the loss of the lives of Turkish nationals on the high seas by reason of a collision with the French vessel *Lotus*, would seem to have gone very far in conceding a right of jurisdiction over crimes and offenses committed extraterritorially.

The system of extraterritoriality worked well until comparatively recent times, when there grew up a number of abuses. Political espionage became rife and culminated in national interventions of a political character. Such activities as the maintenance of saloons, gambling houses and brothels in Constantinople by foreigners constituted a defiance of Turkish authority which virtually left these places subject to no law. Foreign commercial enterprises operated to the disadvantage of natives, and immunities were abused to further foreign economic interests. The extension of privileges and immunities to natives known as protégés, who thus escaped the full control of their national government, was an abuse particularly resented. The demands of nationalism, along with gradual adoption of judicial standards acceptable to the western powers, led to the abolition of extraterritorial rights in one country after another. Where the system had been embodied in international treaties, thus ceasing to be a purely municipal subject, its abolition was complicated, although it today remains a real problem only in China.

Legal reform, the adoption of a constitution and the codification of laws between 1889 and 1891 were a prelude to the abolition of extraterritoriality in Japan. The rights of Portugal were ended in 1892, of Great Britain in 1894 and of

other powers within the next few years. At the Versailles Peace Conference the powers refused to forego their rights in Persia, but Russia in 1921 abandoned its rights by treaty. Siam's demand for the abolition of extraterritoriality at the Versailles Peace Conference was denied, but in 1919-20 Germany, Austria and Hungary abandoned their rights there and the United States led the other powers in signing treaties abolishing the international courts in Siam, reserving only the right of evocation for a limited period. Turkey abolished extraterritoriality by unilateral action in 1914 and all signatories to the Treaty of Lausanne of 1923 accepted this action. The United States, because of the failure of the Senate to ratify the treaty, was left in the situation of being unable to give its formal consent to the abrogation of extraterritorial rights by the unilateral act of Turkey in 1914. The United States did not insist, however, on the exercise of these rights.

The United States lays claims to rights of extraterritoriality in Abyssinia, China, Egypt, Irak, Morocco, Muscat, Siam and Turkey. With reference to territories formerly attached to Turkey, the United States might claim certain theoretical rights of extraterritoriality in Bulgaria by reason of article 175 of the Treaty of Neuilly signed November 27, 1919, and in Egypt American nationals still enjoy extensive privileges under the old Turkish Capitulations. Mixed courts on which American judges sit also exist in Egypt for the trial of cases involving foreigners and natives with respect to civil and commercial litigations as well as to minor offenses against police regulations.

PHILIP MARSHALL BROWN

CHINA. Special privileges and immunities for foreigners on Chinese soil have long formed one of the principal subjects of contention between China and foreign powers. The Russo-Chinese treaty of 1689 permitted merchants of each nationality to carry the laws of their country with them on visits to the other country. This impairment of the authority of the law of the two countries was bilateral and justified by mutual convenience. The first of the "unequal" treaties, to which the Chinese have recently objected so strongly, was signed in 1842 when the British, following their victory in the "opium" war, secured the benefits of extraterritoriality in China without granting the same privileges to Chinese subjects on British soil. In 1844 the United States and France negotiated similar treaties and

eventually unequal treaties were concluded between China and nineteen foreign states.

Originally the Chinese seem not to have been offended by the impairment of their authority over foreigners within their gates and were apparently even happy to be relieved of the task of controlling foreign seamen and traders. But in the course of time they grew resentful at the one-sided character of the system and made the following leading objections to it. First, the multiplicity of jurisdictions in the treaty ports, especially where there were foreign concessions or settlements, confused the administration of justice. Second, the negligence of some powers resulted in the lack of any law governing foreigners in certain classes of cases. Third, foreign judicial officials seemed unduly favorable to their own nationals at the expense of the Chinese. Fourth, foreigners who refused to submit to Chinese law sometimes seemed unwilling to observe their own. Fifth, Chinese could evade their own law by collusion with foreigners operating under the protection of extraterritoriality. Sixth, fugitives from Chinese justice, especially political offenders, could too easily take refuge in places under foreign jurisdiction and abuse their privilege to the grave injury of China. Seventh, the Chinese possessed no effective power to deport offensive foreigners protected by extraterritoriality. Finally, the system threatened to lead to dangerous political penetration of Chinese territory. An illustration of this danger was afforded by the heavy immigration of Koreans into Manchuria, where they or the Japanese government for them could claim the protection of Japanese law.

In defense of their special privileges and immunities foreigners brought forward several arguments. They denounced the "oddness" of Chinese law, e.g. Chinese indifference to the distinction between accidental and wilful homicide, which resulted in holding physicians and surgeons responsible for the disability or death of patients. They objected to the methods employed to secure confessions from criminals, political and especially military interference with the course of justice and what seemed to them the excessive corruption of Chinese judges.

The efforts of the Chinese to bring the system of extraterritoriality to an end have been hampered by the disorders accompanying the revolution and the delay in reconstructing the national government. In 1902 the British government agreed to abandon the system when the condition of the country should seem to warrant it and in 1903

the American and Japanese governments followed suit, but conditions in China have not yet been such as to induce these governments to carry out the agreements. When China entered the World War she denounced the treaties which granted special privileges and immunities to the Central Powers. The Soviet government has abandoned Russian privileges. The Chinese attempted to end the system at the Paris Peace Conference and the Washington Conference and by invoking their rights under article 19 of the Covenant of the League of Nations, but without success. In December, 1929, the Chinese government announced that the system would terminate on January 1, 1930, but presently added that, while the gradual abolition of extraterritoriality would be deemed to begin as of that date, no further steps would be taken actually to end remaining special privileges and immunities without the consent of the powers. Seventeen powers still claim extraterritorial rights in China. All but the United States, France, Great Britain, Japan, the Netherlands and Brazil have agreed to relinquish them when such action shall have become unanimous.

EXTORTION. When Blackstone wrote his *Commentaries*, the English common law limited extortion to the act of an officer in "unlawfully taking, by color of his office, from any man any money or thing of value that is not due to him, or more than is due, or before it is due" (vol. iv, p. 141). As the law of England now stands, the narrower definition is still observed; extortion is limited to the acts of officials. The same narrow definition is used, by constitutional necessity, in the federal criminal law of the United States. In the American states, partly by judicial decisions but largely through statutory development, this original definition of the crime of extortion was enlarged to include others than public officers and threats more extensive than those involving the "color of official right." In this sense it was in many jurisdictions so broadened as to include "the obtaining of property from another, with his consent, induced by a wrongful use of force or fear, under circumstances not amounting to robbery" (8 *Ruling Case Law* 315). Thus enlarged, extortion includes blackmail. The penal law of New York state provides a good example of the broader statutory use of the term. It is there defined as "the obtaining of property from another, or obtaining the property of a corporation from an officer, agent or employee thereof, with his consent, induced by a wrongful use of force or fear, or under color of official right" (sect. 850). American states have moreover provided a number of other crimes, variously defined, to meet the general question implied in the act of extortion. They have also supplemented the general definition with definitions of extortion by specifically defined officers.

Blackmail in history and meaning is closely related to extortion. In mediaeval England it meant rent paid in labor, grain or money of a baser sort (other than sterling) as distinguished from rent paid in silver, or "white," money. In Scotland and in the northern counties of England it signified a tribute in money, corn, cattle or other property exacted from farmers by freebooters in return for certain kinds of immunity.

The derivation of the word from these sources seems possible, but it may also have come from the old French *maille*, which meant a "small coin," a "certain rent," paid to men of influence on the border for protection against brigands with whom they were allied; or from the Gaelic *mal*, a rent; or the German *Mahl*, a tribute (8 *Corpus juris* 1114, note 2). The term blackmail is not expressly used in English law. The nearest definition apparently is the crime of "demanding with menaces" (6-7 Geo. v, c. 50, sect. 29, sub. sect. 1), which apparently covers both extortion and blackmail as used in the statutes of American states. Blackmail does not exist as a separate offense in all of the states but sometimes comes under the general head of extortion or some other offense (8 *Ruling Case Law* 373). Where separate definitions exist they differ in language but are as a rule similar in purport.

Although blackmail and extortion are closely related they differ in general in that extortion is not complete unless property is actually obtained, whereas blackmail depends on the intent to extort. Moreover, the threat in blackmail must be in writing, while in extortion it may be written or verbal. Both differ from the crime of robbery under threat of violence, although in early English statutes the attempt to extort money under threat of charging one with crime or threats of violence or such other threats as a man of ordinary firmness could not withstand were called robbery. The distinction now made between robbery and extortion or blackmail is that in the former the taking is without the consent of the person robbed by force of fear, while in the latter the taking is with his consent [McKeown v. State (1926) 246 Pac. 659].

In Athens laws permitting any citizen of good standing to prosecute a criminal were responsible for the growth of a class of "sycophants" who not only extorted money from guilty persons whom they threatened to accuse of a crime but from the innocent as well. The sycophants were, it appears from the frequent references made to them in literature, both numerous and formidable. Wealthy and prominent citizens even went into exile to escape their exactions. In the *Symposium* of Xenophon, Charmides congratulates himself that he has lost all his money and is no longer compelled to live in the fear of these extortioners. The Athenians had special laws against sycophants, but their enforcement was left to voluntary accusers. The victims were not likely, for reasons of expediency, to bring the matter into the courts. Furthermore, while

theoretically the law reached those who actually initiated a vexatious or unwarranted prosecution, it was silent on the subject of blackmail as such unless accompanied by violence.

In Rome delators engaged in the same practices. The laws of Augustus which permitted any person to accuse another of lacking respect for Rome or the emperor and laws regulating marriage and celibacy became instruments in the hands of the unscrupulous, who by threatening to accuse their victims of violation of these laws extorted tribute. On the other hand, the extortions of Roman officials, especially the provincial governors, were notorious. These governors would by threat of imposing some hardship, such as the quartering of troops, upon the provincials extort money, estates and works of art from them. In an attempt to meet both situations a series of laws was enacted. The *lex julia repetundarum*, replacing five earlier enactments, punished every sort of extortion under color of office. Some forms of *crimen vis*, or *falsi*, reached certain cases of private extortion. An *actio quod metus causa* was available to a person forced by threats to complete a legal transaction or, in later law, other damaging act. Other actions, such as the *actio doli*, the *condictiones ob turpem causam* or *ex injusta causa*, under certain circumstances furnished the possibility of punishing extortion. The last great act on the subject is *De concussione*, enacted in the second century of the empire. This act differentiated between *concussiones publicas*, in which the doer through the misuse of the powers of a public office extorts something of profit or advantage, and *concussiones privatas*, in which the doer through threat of a suit at law reaches the same end.

Both French and German law were to a great extent influenced by the Roman law, but the development of the law on this subject differed in the two countries. In early French law only the crime of *concussio publica* existed; it signified extortion by a public official. Extortion by private persons was met only indirectly in provisions relating to other crimes, such as robbery. In the penal code of 1791 the crime of extortion by a private person appeared for the first time (art. 40, sect. 2), but its definition here was narrowly limited to the extortion of the signature or the giving of a writing, a document, a title or the creation of or freeing from a legal obligation by force, violence or constraint. This was embodied in effect in the changed penal code of 1810. It was, of course, found highly unsatisfactory. It did not punish the extortion of

money. It did not cover extortion by means other than physical power. What was popularly known as *chantage*—extortion by means of some sort of moral compulsion, threats of the revelation of a true or a false fact—was not punished. Finally, in the law of May 13, 1863, an article was added which read: "Whoever, by means of a written or verbal threat of defamatory revelations or imputations, extorts or attempts to extort the giving of money or valuables, or the signature of the documents enumerated above, will be punished by imprisonment from 1 to 5 years and a fine of from 50 to 3000 francs" (art. 400). This was the first time that *chantage*, or the extortion of money or something of value by written or verbal threat of a defamatory revelation, appeared in the law on the continent. The law has since been expanded. The same penalty attaches to a false claim of descent as to the crime of extortion.

In Germany, on the other hand, extortion both by public officials and private persons was legally recognized. The definition of the offense when committed by a private person was, however, for long years a subject of dispute by jurists. The French provision of 1810 undoubtedly influenced the German conception, for the crime was narrowly defined by the code of Prussia of 1851, for example, to read: "Whoever, in order to obtain for himself or a third person an unlawful pecuniary advantage, forces or attempts to force another person, by written or verbal threat of a felony or misdemeanor, to commit or forbear an act, is guilty of extortion." This limited definition, however, like that in France, was found unsatisfactory. By article 253 of the imperial code of criminal law the definition was vastly broadened to read: "Anyone who in order to procure for himself or for a third person, an unlawful advantage in property, compels another by violence or threat to commit, suffer or forbear an act, must be punished for extortion by imprisonment with labor for not less than one month. The attempt to commit this offense is punishable." This law has not been changed since, in spite of the fact that on account of its extraordinary breadth it has provoked much criticism. Cases are reported to indicate that it has been invoked in connection with demands on the part of labor which in American practise would be quite innocent of legal wrongdoing.

In the administration of the criminal law extortion particularly and blackmail to some degree constitute the most difficult of crimes to

prosecute successfully. Extortion is very difficult to prove. The threat may be very subtly stated. It may be verbal. Those who are guilty are careful not to commit the act before witnesses. When evidence can be gathered, as in certain "racket" prosecutions in recent years, witnesses are frequently intimidated and juries are fearful of the consequences of a verdict unfavorable to the extortioner. Consequently the statistics of criminal prosecutions show only a meager number of convictions for the crime. Likewise prosecutions for blackmail are exceedingly difficult, even though in blackmail, unlike ordinary cases of extortion, the threat must be written. The source of the threat is usually anonymous. The person threatened cannot afford to make known the existence of the threat, particularly when the threat is to expose a moral dereliction. The prosecuting witness is therefore as anxious as the malefactor to keep the transaction secret.

Extortion reaches far into the fabric of modern civilization and assumes an infinite variety of forms. In economic life business associations have been known to practise extortionate methods against non-members and to join in extortion with labor leaders, who in turn sell protection against strikes and boycotts. In one well known instance a farmers' cooperative engaged in such activities. In political life the "shake-down" practises of unscrupulous legislators are common; some party organizations frequently sell immunities of various sorts for campaign contributions. There are innumerable forms of extortion practised by some administrative officers in the enforcement of certain legal regulations and penal statutes. Whenever these practises are common, bands of professional criminals spring up outside the groups concerned to do the rough direct work of violence.

Forms of blackmail are more easily identifiable but are equally varied. Society provides so extensive a variation between social conventions and commonly practised private conduct that the opportunities for this crime are exceedingly extensive. Any increase in the severity of penal laws increases the danger. Perhaps the most frequent manifestations relate to matters affecting sex relations, and the multiplicity of new laws affecting morals accentuates this form of blackmail. The various local regulations concerning prostitution, often loosely drawn, can be and have been extensively used. Prohibition laws likewise provide the means for blackmail. The many outlets for published materials, particu-

larly newspapers with a spicy turn, increase the means for blackmail. The well known "scandal sheet" type of publication exists for and by blackmail.

Extortion and blackmail are especially frequent whenever social, economic and political organization is weak and corrupt. "Racketeering," for example, flourishes where city government is unable or unwilling to provide protection and where the economic conflict is ruthless and primitive. But in every society the presence of these forms of coercion is symptomatic of a larger problem. Much of normal social life depends upon coercion of one kind or another; a detailed study of the social structure would show how extensively these forms of pressure, at first casual and regarded as wrongful, come ultimately to be brought within the law and accepted as normal and justifiable.

EXTRADITION, or the mutual rendition of fugitives from justice, is of comparatively modern origin. In ancient and mediaeval times the practise appears to have been sporadic; it was invoked generally in the case of political rather than common offenders. The notion was widely held that fugitive offenders should be given asylum. With the rise of the modern state system, however, and the development of means of travel and communication cooperation in the suppression of crime became a matter of international concern. It became evident that states

must either find a way to administer the penal laws of other states, develop a cosmopolitan system of criminal jurisprudence or provide for the surrender of fugitives. The first alternative presented the gravest practical difficulties; the second was obviously utopian; the third was developed extensively through the conclusion of bilateral treaties.

While the obligation to extradite in the absence of treaty was supported by reputable opinion as late as the early nineteenth century it never became established in international law. France concluded an extradition treaty of the modern type with Württemberg in 1759. The first extradition provision in a treaty of the United States was incorporated in article twenty-seven of the Jay Treaty of 1794 with Great Britain. Among states whose systems of penal law and procedure had at least basic similarities bilateral extradition conventions multiplied rapidly in the nineteenth century, until the world came to be covered by a network of such agreements. General extradition statutes were enacted in many states to govern procedure, and in a few states provision was made for surrender in the absence of treaty. In 1902 seventeen American countries, including the United States, signed a multilateral extradition convention; but this agreement was never ratified.

Under the treaty system the request for extradition is usually made through diplomatic channels, although some conventions allow more informal demands; and it is common to provide for provisional detention of the fugitive pending a formal demand. In the United States, except under article nine of the treaty of 1899 with Mexico permitting requisitions through the authorities of frontier territories in certain cases, extradition is regarded as exclusively a national function. The procedure for determining whether a request for extradition shall be granted varies. In many states evidence establishing the identity of the accused, the nature of the offense charged and the accusation at the place where the offense is alleged to have been committed is sufficient. In Great Britain and the United States, on the other hand, extradition is regarded as essentially similar to committal for trial, and it is necessary to produce evidence which would justify bringing the fugitive to trial at the place of asylum if he were charged with a similar crime committed in that country. While "competent evidence to establish reasonable grounds is not necessarily evidence competent

to convict," the Anglo-American practise makes extradition substantially more difficult.

There is also a diversity in treaty provisions and in practise with respect to the extradition of nationals of the asylum state. In Great Britain and the United States the jurisdiction of crime is regarded as essentially territorial, and consequently these countries are prepared to surrender their nationals for trial at the place where the alleged offense was committed. Most countries, on the other hand, refuse to surrender their nationals, chiefly on the ground that their own criminal codes provide adequately for the punishment of crimes committed by nationals abroad. From the Anglo-American point of view the justification is insufficient, since crime should be tried and punished whenever possible at the place where it was committed and since a fugitive convicted abroad before taking refuge in the country of his allegiance must either be extradited, tried twice for the same offense or permitted to escape punishment. The exception has nevertheless been recognized in a number of the treaties concluded by Great Britain and the United States.

The treaty usually enumerates the offenses for which extradition will be granted. Early treaties enumerated only a few major crimes; in the later conventions the list of extraditable crimes has been considerably expanded. Thus the treaty of 1794 between Great Britain and the United States provided for the surrender only of fugitives charged with murder or forgery, while the conventions now in force between these countries enumerate more than a score of extraditable offenses. The list of extraditable crimes depends of course upon the importance of extradition to the countries concerned. Between Canada and the United States, for example, extradition for some of the less serious crimes is of relatively much greater importance than it would be between Norway and New Zealand. Since the process is cumbersome and expensive at best, the list is usually not expanded beyond actual needs. It is generally confined to those crimes which are similarly defined in the laws of the two countries. Between countries having quite different systems of penal law the scope of extradition is necessarily limited. The treaties generally require that the act for which surrender is demanded shall be punishable by the laws of both countries and exclude prosecution for offenses other than those for which extradition is granted. In some of the more recent treaties there is included in lieu of the usual list

of extraditable crimes an agreement to surrender fugitives charged with any act punishable with a certain minimum penalty. It has been suggested that such stipulations may provide the prototype for a general international convention.

Practically all modern extradition treaties exclude the surrender of political offenders and forbid the prosecution or punishment of an extradited person for a political offense. There is no generally accepted definition of a political offense. Obviously it includes more than treason, sedition and the like, since these offenses are not included in the treaty lists of extraditable crimes. On the other hand, it seems clear that a mere political purpose or motive should not make a political offense out of a common crime. A political offense in the treaty sense can perhaps best be described as a crime, otherwise extraditable, which is excluded because incidental to and in furtherance of a political disturbance in the demanding state. In practise the decision is left to the state of asylum.

A unique case was presented when at the end of the World War the German emperor abdicated and took refuge in Holland. The Treaty of Versailles (art. 227) charged the emperor with "a supreme offence against international morality and the sanctity of treaties," provided that he should be tried before a special tribunal of five judges, one to be appointed by each of the principal allied and associated powers, and directed the allied and associated powers to request his surrender by Holland. The tribunal was to be guided in its decision by "the highest motives of international policy, with a view to vindicating the solemn obligations of international undertakings and the validity of international morality." Since there was no law, national or international, covering the case, since the alleged offense was of a political nature and since Holland was not a party to the Treaty of Versailles, the Dutch government very properly refused the request for extradition.

The extradition of fugitives as a matter of comity, in the absence of treaty or outside the provisions of an existing treaty, is practised in many countries. Usually it is conditioned on reciprocity. In Great Britain and the United States, however, the opinion prevails that there is no authority to extradite apart from treaty or statute. In one case, that of Arguelles, surrendered to Cuba in 1864, the United States granted such a request; but the authority of the executive to extradite in such circumstances is at least doubtful. Since the United States does not grant

extradition in the absence of treaty it refrains from requesting extradition either in the absence of treaty or in cases not covered by a treaty in force. It has occasionally in exceptional circumstances sought the surrender of a fugitive as an act of courtesy, while explaining that it is not in a position to reciprocate, and has on numerous occasions accepted the surrender of fugitive criminals which the state of asylum was willing to return. It has also prosecuted and punished fugitives recovered in an irregular way on the principle that the fugitive is in no position to object to such irregularities. The kidnaping of a fugitive may give rise to an international reclamation by the state of asylum and to a private reclamation against the kidnapers; but the state recovering the fugitive may proceed nevertheless to prosecute and punish. In 1911 in the case of Savarkar it was decided by a tribunal of the Permanent Court of Arbitration that irregular rendition by authorities of the state of asylum under mistake of fact was not ground for requiring the fugitive's return.

Within a federal state or a confederation of states provision is always made for the rendition of fugitives from justice, but except among the members of a loose confederation this is not to be regarded as extradition in the international sense. In the United States the federal constitution contains the following provision: "A person charged in any state with treason, felony, or other crime, who shall flee from justice, and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime" (art. 4, sect. 2, clause 2). Legislation enacted in 1793 for giving effect to this provision is now incorporated in the United States Revised Statutes (§§ 5278-79). As compared with international extradition interstate rendition in the United States rests upon a somewhat narrower definition of fugitive than is commonly found in international treaties; requires only that the fugitive shall be properly charged with a crime committed in the demanding state; requires only that the offense charged shall be a crime by the laws of the demanding state; includes "every offence against the laws of the demanding state, without exception as to the nature of the crime"; permits prosecution of the fugitive for other offenses than those for which he was extradited; makes no exception of fugitives who are citizens of the state of asylum; and makes no exception of political offenses.

Existing diversities in international rule and practise under the hundreds of bilateral extradition treaties now in force have encouraged jurists to advocate a single multilateral treaty, but the movement has made little progress. The divergencies of practise with respect to the surrender of nationals are deeply rooted. Differences in procedure are not easily reconciled. It would be difficult to secure agreement on a list of extraditable crimes. Since a general convention at the present time would probably be incomplete or would incorporate a number of optional clauses, it has been doubted whether it would achieve the end desired. The League of Nations Committee of Experts for the Progressive Codification of International Law has recently pronounced against the feasibility of such a convention.

EYTH, MAX (1836-1906), German agricultural organizer. After studying in the technical college at Stuttgart, Eyth was trained as a locksmith, worked in a foundry and traveled abroad. In 1861 he went to Leeds, where he entered the employ of John Fowler, the inventor of the steam plow. He made several valuable inventions and soon became Fowler's technical and scientific adviser. He worked with steam plows

in Egypt from 1862 to 1866 and in 1868 again in Fowler's employ introduced the plow into the southern United States. After further travels in all parts of the world Eyth returned to Germany in 1882 and began his important work for German agriculture. He admired the work of the English Royal Agricultural Society and after a hard struggle to convince the farmers of the necessity of such an institution established in 1883 the *Deutsche Landwirtschafts-Gesellschaft*, which in 1886 held the first great German agricultural exhibition. Since then, except during the World War, such exhibitions have taken place almost annually, traveling throughout Germany, and have been a strong influence in the development of scientific agriculture. Special sections of the society are concerned with tilling, raising seed, fertilizers, breeding of animals and farm management. It has now over 40,000 members, including many in foreign countries. The last ten years of Eyth's life were devoted to writing several volumes, which include his memoirs and a number of essays on the development of the machine system in agriculture.

EZPELETA, PEDRO AINGO DE, Spanish theologian and economist. Aingo de Ezpeleta was born near the end of the sixteenth century. He became professor of philosophy and theology at the University of Valladolid. In his chief work, *Resoluciones prácticas, morales y doctrinales de dudas ocasionadas de la baja de moneda de vellón en los reinos de Castilla y de León, antes y despues de la ley y premática de ella publicada en 15 de Setiembre 1642 . . .* (Madrid 1643, enlarged ed. 1654), following Aristotle he ascribed the origin of money to the inconvenience of barter. He championed the quantity theory of money, which he held to be generally accepted, but occasionally expressed views inconsistent with it. Unlike most of his contemporaries he saw in expediency sufficient cause for monetary alteration by the prince. Colmeiro places him among the *arbitristas*, the group of writers who for some two centuries offered supposedly infallible and painless remedies for the ills of Spanish public finance; yet few books on economics have had a more constructive aim or met a more immediate practical need than the *Resoluciones*. As the title indicates, its purpose was to formulate rules for the settlement, juridically or privately, of dis-

putes occasioned by the continuous debasement of the coinage by Philip IV. These rules show that Aingo de Ezpeleta under the influence of Aristotle and Thomas Aquinas was largely able to free himself from ecclesiastical preconceptions, although he was a priest in the darkest days of Spanish Catholicism.

EARL J. HAMILTON

FABBRONI, GIOVANNI (1752-1822), Italian scientist and economist. A man of comprehensive scientific knowledge and an ingenious technologist, Fabbioni early won the esteem of Grand Duke Peter Leopold and later of Napoleon, who appointed him to many public offices including a post in the Council of State in 1810. He belongs to the group of Tuscan economists whose influence on their government during the eighteenth century and subsequently placed it in the vanguard of liberalism. The complete freedom which Peter Leopold had granted to the grain trade in 1775 would have been extended by Fabbioni to all commerce. This policy he defended in *Della prosperità nazionale, dell' equilibrio del commercio e istituzione delle dogane*, published in two sections in 1789. But Peter Leopold's departure from Tuscany the following year not only rendered further progress impossible but gave rise during the nineties to a series of reactionary movements manifested in temporary experiments with price fixing and customs duties on all commodities. To voice his protest Fabbioni wrote *Gli ozi della villeggiatura* (1800), in which a group of interlocutors representative of various Tuscan estates discovered after protracted discussion that free trade was the sole remedy for famine and the only source of public tranquillity and welfare. This not uncommon device among the Leopoldine reformers for educating public opinion was followed, after the foundation of the kingdom of Etruria, by Fabbioni's most systematic treatise, *Dei provvedimenti annonarj* (Florence 1804, 2nd ed. 1817). In this acute analysis of the grain policies of his time he set forth the doctrine that national welfare consists in the harmonious activity of agriculture, commerce and industry and showed that the prosperity of industry depended upon free competition, which alone could preserve a balance between prices and wages. The work did much to halt the restrictive policy contemplated by the queen of Etruria. Fabbioni was an enlightened monetary theorist. In a report addressed to the Accademia de'Georgofili in 1785 and in various

later pamphlets he showed that coinage was an industry undifferentiated from other industries, that the melting and exportation of coins should arouse no solicitude, that governments should be concerned only with maintaining an adequate supply of fine metal and that in view of the absurdity of a legal ratio between gold and silver a monometallic system must be the solution. Entirely emancipated from mercantilism and retaining from physiocracy only a belief in the primary importance of agriculture, he was distinguished among the Tuscan reformers by his theoretical rather than merely practical endorsement of economic liberalism and among the advocates of laissez faire by his lack of undue optimism.

MARIO MARSILI LIBELLI

Works: Fabbioni's economic works were collected in *Raccolta degli economisti toscani*, 4 vols. (Florence 1847-49) vols. iii-iv.

FABER FAMILY, German newspaper publishers. From the year 1730, when Gabriel G. Faber (1697-1771), the proprietor of a Magdeburg printing house, became the publisher of the *Magdeburgische Zeitung*, the second oldest German newspaper, the Fabers exercised a formative influence upon the German press, especially the provincial political home journal. Under Friedrich A. H. Faber (1778-1847) and Gustav Carl Faber (1811-96) the *Magdeburgische Zeitung* was moderately liberal although it opened its columns to Bismarck, Entenbon and other conservatives. The Fabers won wide acclaim by adding special supplements to the editorial part of the paper as early as 1740, by their constant struggle to break the official gazettes' monopoly of the right to publish advertisements and by their opposition to the Prussian censors' power to bar sales through the mails. They led the way in simplifying the selling of newspapers and in printing stock quotations and weather charts and in 1878 introduced the first newspaper rotary press in Germany. On the establishment of the Verein Deutscher Zeitungsverleger in 1894 F. G. Robert Faber (1869-1924) became its first president. He emphasized the importance of political journals as contrasted with general newspapers and became the chairman of the publishers' representation in the Reichsarbeitsgemeinschaft of the press, which

is a joint organization of newspaper publishers and editors.

HANS TRAUB

Consult: Faber, Alexander, *Die Fabersche Buchdruckerei* (Magdeburg 1897); Salomon, L., *Geschichte des deutschen Zeitungswesens*, 3 vols. (Oldenburg 1900-06).

FABIANISM is the doctrine of the Fabian Society, a small but influential group of British socialists. This society grew out of the Fellowship of the New Life, founded in 1883 under the influence of Professor Thomas Davidson, which looked to ethical reform and utopian community making, rather than to political action, for the regeneration of society. A group which included Frank Podmore and Edward R. Pease broke away from the Fellowship to found the Fabian Society in 1883. George Bernard Shaw joined in 1884, Sidney Webb in 1885. With the advent of these two Fabianism began to assume its distinctive character and the society became definitely socialist in 1887 with the adoption of its "basis," or statement of policy. The society first became famous with the publication of the *Fabian Essays* in 1889 by Shaw, Webb, Annie Besant, Graham Wallas and others. This volume was followed up by a series of over two hundred *Fabian Tracts* designed for popular consumption and the application of Fabian doctrines in a practical way to particular questions of immediate policy. The Fabian Society at first set out largely to present an alternative to the then dominant Marxist Social Democratic Federation. Fabian socialism was and has remained essentially evolutionary and gradualist (hence its name, from the tactics of Fabius Cunctator), expecting socialism to come as the sequel to the full realization of universal suffrage and representative government.

The essence of Fabian doctrine lay in Sidney Webb's theory of the continuity of development from capitalism to socialism. Whereas Marxism looked to the creation of socialism by revolution based on the increasing misery of the working class and the breakdown of capitalism through its inability to solve the problem of distribution, Webb argued that the economic position of the workers had improved in the nineteenth century, was still improving and might be expected to continue to improve. He regarded the social reforms of the nineteenth century (e.g. factory acts, mines acts, housing acts, education acts) as the beginnings of socialism within the framework of capitalist society. He saw legislation about wages, hours and conditions of labor, and

progressive taxation of capitalist incomes as means for the more equitable distribution of wealth; and he envisaged the next steps toward socialism in terms of such social reforms as public ownership and administration of industries and services. There was no room in Webb's ideas either for a theory of increasing misery or for revolution; he saw no reason why, if men would but behave sensibly, the world—or at least Great Britain, for the Fabians at this state had thought little about other countries—should not move gently into socialism by a series of steps no one of which need involve any sharp or dramatic break with the past. Webb supported his view with illustrations drawn from the history of the nineteenth century, showing that side by side with the growth of laissez faire there had been a parallel growth of state intervention in the interests of the worker or at least for the improvement of the quality and conditions of life.

George Bernard Shaw decisively repudiated Marxism in the economic field, and the cornerstone of Fabian economic theory became the Ricardian law of rent. Ricardo had demonstrated that the wealth of landlords arose from their monopoly of the soil and from the differences in the productive value of different pieces of land which enabled the landlord to skim off as rent the difference between the yield of his piece of land and that of the least productive piece in cultivation or use. The Fabians, following up hints in earlier writers, developed this theory of rent to apply not to land only but also to capital and to personal ability. They considered large incomes to be chiefly rents arising from the possession of differential monopolies and maintained that these rents belonged properly not to the monopolists but to the community as a whole. The economic problem was thus presented as a question of the socialization of monopoly incomes through social ownership of the monopolies.

This view fitted in admirably with Webb's doctrine of continuity and gradualism. It made the theory of industrial socialization a natural and logical development of the already familiar thesis that the land ought to belong to the people or at least that the rents arising from its differential qualities ought to be socially appropriated. This doctrine, which as a demand for the "single tax" had received tremendous impetus from Henry George's work, had been preached from the eighteenth century. It had been broadly endorsed by the great authority of John Stuart Mill and had been the subject of constant agitation

by land and labor leagues, land reform associations and similar bodies for decades before the revival of British socialism in the 1880's. Shaw and the Fabians were thus in effect appealing to the radicals, who were already land reformers, to recognize socialism as the logical outcome of their ideas. Hence the stress which the Fabians always laid on their contention that there was no fundamental difference between land and capital or in the incomes derived from them. Both were mainly the results of differential monopoly.

The Fabians were no less emphatic in repudiating the Marxian theory of value, as they understood it, and in preferring to base their economic theory on Jevons and the orthodox English economic tradition. They saw the source and measure of value not, with Marx, in labor but, with Jevons and his follower Alfred Marshall, in utility. This fitted in with their general tone of mind, for the Fabians were above all utilitarians, seeking to adapt the doctrines of Jeremy Bentham and his successors to the changed economic conditions of the later nineteenth century. Bentham had used his principle of "the greatest happiness of the greatest number" chiefly to justify the abolition of bad forms of state intervention. The Fabians now applied it to justify good forms, looking back on the early Benthamite work of destruction as admirable, but desiring to complement it by construction. John Stuart Mill they recognized as standing at the point of transition between the two interpretations of utilitarianism. Although he sympathized with the socialism of his day, he was too deeply rooted in old traditions for a complete conversion. The Fabians regarded themselves as completing the work which he had begun and thus found further cause to emphasize their continuity with older liberal thought.

Fabian socialism differed from the current Marxian socialism not only in doctrine but still more in spirit and in its conception of the influences making for socialism. At bottom what matters in Marx is not his theory of value but his emphasis on the class struggle as the sole effective instrument of progress. Marx believes that socialism will come not only because it is a better system than capitalism but because there is behind it a rising class led by economic conditions to achieve it. Fabian literature, on the other hand, seems often to be unconscious of the relevance of class distinctions and shows no belief at all in a class struggle as the instrument of change. The Fabians are essentially rationalists, seeking to convince men by logical argument that social-

ism is desirable and offering their arguments to all men without regard to the classes to which they belong. They seem to believe that if only they can demonstrate that socialism will make for greater efficiency and a greater sum of human happiness the demonstration is bound to prevail.

With this rationalism there went in early Fabianism a singular blindness to the importance or relevance of working class organization. The early Fabians, as they themselves recognized later on, often seemed never to have heard of trade unions or cooperative societies, or at all events to take no interest in them. But their awakening came with the big movement of labor unrest that culminated in the famous strike of the London dockers in 1889. Trade revival now brought a host of new workers into the trade union movement and caused a big movement of organization among the less skilled workers. New leaders came to the front armed with socialist ideas and demands for protective industrial legislation. Battle was joined between the liberal leaders of the older trade unionism and the socialist leaders of the new. Fabians were influenced like the rest of the public to reckon with the unions, the more so because a few of them, headed by Annie Besant, had taken an active part in the struggle.

Moreover, the Fabian Society now obtained a most important new recruit in Beatrice Potter, later Mrs. Sidney Webb, who had worked with Charles Booth on his great survey of *Life and Labour of the People in London* (17 vols., London 1903). Under the influence of her more realistic attitude toward the social problem Webb collaborated with her in a detailed study of the actual organization of the working class; and the fruits were seen in her book on *The Cooperative Movement* (London 1899) and in their joint works on *The History of Trade Unionism* (London 1894, rev. ed. 1920) and *Industrial Democracy* (2 vols., London 1897; rev. ed., 1 vol., 1920), which fully recognized the vital part which working class organization was bound to play in the making of socialism. Although these writings made a profound impression, it is doubtful if the Fabian Society as a whole fully absorbed their lessons. It began, indeed, to woo the working class movement on behalf of socialism, but its endeavors, like those of the Independent Labour party, were directed rather toward drawing the trade unions into socialist politics than toward working out an industrial socialist policy. Fabianism remained predominantly rationalist and collectivist, merely adding an appeal to trade

Encyclopaedia of the Social Sciences

unions to its appeal to the general public. In no sense or degree did it adopt at any stage a class point of view.

The reform of English local government in 1888 and 1894 called the attention of Fabian leaders to the possibilities of the local authorities as agents both of social reform and of constructive socialization. They began to work for the return of socialists as members of local authorities and for the development of municipal trading as the complement to nationalization, thus winning great prestige and influence in the municipal field and making their policy widely known among local working class leaders. Again the Webbs were the leaders; and their history of *English Local Government* (9 vols., London 1906-29) marked their sense of the importance of a realistic and scientific approach to every practical problem.

When the Fabian Society began its work, the only important socialist body was the Marxian Social Democratic Federation, led by Henry Mayers Hyndman, which held aloof from the new trade union movement. In 1893 the Independent Labour party was created as a predominantly working class socialist body to build up an independent party on a class basis and to detach the older trade unions from Liberalism. The new body had at the outset no very clear policy, and the Fabians set out to provide it with one. Their doctrines fitted in well with the immediate demands of the new movement, and their ably written *Tracts* enabled them to exert great influence.

From the first the Independent Labour party regarded itself as only the forerunner of an inclusive working class party in which trade unions as such should directly participate. The Fabians helped in the effort to create such a party, which came to fruition in the Labour Representation Committee in 1900. They were from the outset a constituent body of the Labour Representation Committee and the Labour party. Thus while Fabianism was not a working class movement it helped to bring an independent working class party into being and gave that party its collective support. But, characteristically, the society continued to include members who sat in Parliament or on other public bodies as Liberals, and saw no inconsistency in encouraging its members to work inside the older parties even after it had helped to bring the new one into being. In London the Fabians, headed by Webb, largely supplied the brains of the Progressive party which for a period controlled the London County

Council. Fabianism was inclined to regard the Labour party rather as the working class wing of the political socialist movement than as coextensive with that movement, an attitude not wholly extinct today.

In international politics the Fabians have always been on the Right wing of the socialist movement. At the time of the South African War they alienated much support by refusing to join the opposition and contending that it was in the interest of civilization that the South African republics should be annexed to the British Empire. Bernard Shaw was the chief exponent of this view, as he has been on principle opposed to nationalist movements and in favor of the unification of the world into larger economic and political units. Similarly in 1914 the majority of the Fabians, unlike the Independent Labour party, followed the Labour party in its support of British participation in the war. Repudiating the class war, the Fabians have usually recognized their loyalty to their own state as coming before any loyalty to the international working class movement. This, however, did not prevent them from working out detailed plans for the prevention of war and the evolution of international economic and political cooperation. L. S. Woolf's *International Government* (Westminster 1916), proposed in the Fabian Research Department, was one of the most important documents leading up to the creation of the League of Nations.

In every field the characteristic Fabian policy has been that of permeation. In accordance with their doctrine of continuity the Fabians set out to develop existing institutions by permeating with this or that element of their doctrine those who had power to influence policy, e.g. the civil service, the political parties, the professions, the administration of business, and local government. It was part of their creed that no sharp line could be drawn between socialists and non-socialists and that many who would not call themselves socialists could be persuaded to help with particular reforms making for socialism. This policy was most successful in the campaign which followed the Reports of the Royal Commission on the Poor Laws of 1909. Mrs. Webb embodied in the minority report a host of semi-socialistic schemes, and a great national campaign of propaganda was organized by the National Committee for the Prevention of Destitution, a special Fabian body.

During the first decade of the twentieth century the Fabian Society grew rapidly. Between

1906 and 1915 it went through four serious crises. A group of members headed by S. G. Hobson, later prominent as a guild socialist, tried to lead the Fabians into a socialist party which would be more militant than the Labour party, which was at that time inclined to work as the Liberals' subordinate ally. Later a considerable body of younger members desired to expel all members who were not supporters of the Labour party and to commit the society to working wholly in and through the Labour party. Both these movements were heavily defeated by the "Old Gang," led by Shaw and the Webbs. A similar fate befell H. G. Wells' program of enlarging the society's membership and setting up a network of branches throughout the country. The failure in 1914-15 of a group which included G. D. H. Cole to induce the society to abandon active politics was followed by the secession of the Fabian Research Department and its reorganization as a Labour Research Department based mainly on trade union support. This department, both before and after the secession, was the leading research organization of the Labour movement. Out of it arose indirectly the research departments subsequently set up by the Labour party and the Trades Union Congress. In 1931 the New Fabian Research Department was constituted.

From 1915 onward the history of the Fabian Society was for the most part tranquil. The old leaders continued at the head, and the old activities were pursued. Relations with the Labour party became much closer after 1918, when the party adopted its new constitution and accepted an essentially Fabian policy drafted by Webb under the title *Labour and the New Social Order* (London 1918). Indeed, the Fabian policy and attitude were adopted almost in their entirety by Labour after the war; and the recent comparative inactivity of the society is largely due to the fact that the Labour party is a larger reincarnation of Fabianism. The society thus no longer stands for a distinct or clearly defined policy of its own and its members no longer use it as the chief agent for the expression of their policy. It now functions as a home for intellectual discussion of socialism, a research and propaganda publication agency and a body through which membership in the Labour party can be secured by socialists, chiefly of the middle classes, who do not wish to connect themselves actively with the Independent Labour party.

FACTION. The term faction is commonly used to designate any constituent group of a larger unit which works for the advancement of particular persons or policies. The faction arises in the struggle for power and represents a division on details of application and not on principles. The position of the faction is that of the qualified dissenter who embraces collective goals subject to reservations upon the tactics appropriate for their realization. Thus a faction presupposes some measure of unity in fundamentals. The term itself drops out of usage when certain lines of cleavage have become rather permanent features of the political life of a group; these divisions are accepted as parties.

The struggle for power within a group exhibits itself in the struggle for office or for unofficial influence. Unless the controlling personnel is selected by lot or by some fixed principle of succession, rival ambitions furnish the foci about which factional alignments arise. Not all individuals participate in asserting their own claims to political power. Political power has no significance for some. Others consider their chances for success to be entirely unfavorable. Some of those who do not press their own claims spontaneously identify themselves with the aspirations of their friends. This primitive alignment rests on no deep calculation of personal interests. Emotional relations of varying degrees of intimacy are already established, and the crisis of personnel selection provides but a special occasion for their expression. Differences among those who make active bids for power often grow out of elementary antagonisms, although such factors are occasionally nullified by an individual who maintains an unquestioned ascendancy over his fellows. Divisions frequently occur for other than personal reasons, perhaps over divergent interpretations of the common goal or the efficacious strategy.

The possibility of factionalism is increased

when large changes occur in the life situations of members of the group. Even when changes are welcomed they may produce strains within the personalities of those affected. A sudden increase of wealth creates difficulties no less than sudden poverty. New calculations of interests arise, new objects may be chosen for sentimentalization, and factional movements are one result.

Divisions within the group are profoundly affected by the external relations of the group. When it has an assured supremacy, divergent interests and sentiments are no longer held in check by the external threat to the whole value scale. The southern Democrats and the Philadelphia Republicans are sorely rent by intra-party difficulties, since they face no effective opposition. There is also a type of factionalism which appears when the group has no chance of power in the immediate future. Such radical minority movements as have sprung up in the United States have been notably fissured by dissension. Intellectual radicals gain part of their notoriety by distinguishing themselves from others, and the field is open for the elaboration of dialectical differences when decisive thrusts for power are out of the question. The intensive study of individual case histories has demonstrated that when aggressiveness toward the outside world is thwarted it is turned back against the self or against external objects more closely associated with the self. When the opportunities open to the group with which the individual has identified himself are limited, the person may direct some of his aggressiveness against other members of the group. This is one of the deeper psychological bases for dissension among the unsuccessful. Whenever effective opposition appears or an opportunity arises for immediate success, factional strife subsides spontaneously, compromises are made and active measures for the suppression of persistent dissenters are put into effect.

In periods of acute crisis, when revolutionary changes are in progress, the integration and disintegration of political factions may occur with baffling rapidity. The first break with the established order may be ushered in under the united blows of all its antagonists. The collapse of the old fabric may bring into prominence those factions which remain loyal to a circumscribed program, and even the more aggressive elements may temporarily concur in the presence of a strong counter-revolutionary danger. But once the moorings of old loyalties are swept

aside, anti-authoritarian drives are released and factions champion more drastic measures, as they did during the French and the Russian revolutions. The old authority reinforced the individual's conscience, which forbade him to violate the conventional and moral standards of the society. When the outer evidences of authority perish, the conscience is no longer supported from without, and the asocial impulses within the personality may assert themselves with decisive strength and lead to wrecking expeditions against the whole social order.

Viewed in the perspective of history factions were the predecessors of the modern parties. When authority was in a few hands and active politics was the private affair of a limited circle, factional cleavages occurred over the advisers of the sovereign. As rivalry for power widened the proportion of the community which actively participated in political life and electoral practices developed, self-conscious groups undertook to maintain their organization from one electoral crisis to the next and to present candidates in their own names for the available posts. Under such conditions the factions became parties. Within each party new factions appeared occasionally breaking away and forming new parties. In some states a two or three-party system became the rule. Whenever a change of the effective executive, as distinguished from the ceremonial or formal executive, involves a direct popular vote or a new parliamentary election, a premium is placed upon the maintenance of the two or three-party system, which involves the subordination of factionalism to party unity. In the United States it requires a tremendous electoral organization to win a presidential election, and the hope of a majority or a substantial plurality keeps the factions from secession. The importance of the machine lies in the fact that active popular interest is essentially episodic and that the winning of an election depends on stimulating apathetic voters to participate, except in those rare moments when a sense of crisis prevails. During the intercrises the prestige and the machinery of the old parties are enough to deter factions from carrying their divergences to the point of separation. Even under the multiple-party system, where effective executive authority can usually be changed without running the risk of a parliamentary dissolution or of a direct popular vote, minute parties labor under many handicaps and show a high mortality rate.

A superior international organization like the

Communist International or the Catholic church can discourage factionalism by conferring a sense of importance upon national units and by utilizing various weapons of inducement and coercion. Wherever the state creates a monopoly of legality for one party, which is the present position of the communists in the U.S.S.R. and of the Fascists in Italy, an unusual deterrent exists from carrying factional struggles to the point of withdrawal, although internal tension may be acute.

The term faction has been employed as an opprobrious epithet in the political field since Roman days: the word arose from the name given to the divisions into which Roman charioteers were separated. A ruling group finds it convenient to stigmatize its rivals within the organization, and the epithets which are most effective convey the innuendo of wilful self-seeking. Those who are in power have the benefit of the assumption that they represent the collective interests in substance as well as in form. A faction seems to subordinate the public good to private gain, and thus the term takes its place in the dialectic of the political struggle, especially as a means of defense and counter-attack by those in power. The epithet is quickly taken up by those who concur in the established policies or who are loyal to the ruling personnel, and hurled against the dissenters. The intensive study of individuals has repeatedly demonstrated the ambivalent attitudes which characterize so many human relationships. Those who acquiesce in any authoritarian regime repress more or less successfully their own hostility against that regime. If authority is challenged from without it tends to reactivate a struggle within the personalities of the loyal, who seek to protect themselves from this struggle by attacking the dissenter. Casting opprobrium on the challenger is a protective reaction which externalizes the individual conflict and hastens the removal of the disturber from the environment.

FACTORY LAWS. See LABOR LEGISLATION.

FACTORY SYSTEM. Most persons would describe the factory system as a modern form of production which developed in western Europe in the eighteenth century and has since spread over the world. This description is true of the

factory system, but it is not true of the factory. Little is known of the organization of textile production in ancient Egypt, Assyria and Phoenicia, but it is clear that in those early civilizations textile production was not merely a domestic industry. The term factory is applied to three different kinds of establishment which existed before the eighteenth century. Princes and rich men at different times and in different places set up great establishments in order to provide for their own needs and those of their courts and households. Well known examples are the factories in Constantinople which supplied Justinian's palaces with silk and the factories of Louis XIV which supplied Versailles, St. Germain and Marly with tapestry and other decorations. Side by side with such establishments and sometimes developing from them there existed factories producing not for a domestic estate or household, but for sale. There were such factories in the Roman Empire producing glass, pottery, articles of bronze and other commodities for export. In the Middle Ages Antioch and Tyre had great silk factories, and when silk production was acclimatized in Europe factories were set up at Genoa and other places. In England factories were not quite unknown in the days of Henry VII; a rich cloth merchant, John Winchcomb of Newbury, who collected workmen carding, spinning and weaving wool in a large establishment, made so strong an impression on the imagination of his time that his exploits were described in a popular poem. France had factories created and fostered by Colbert, but they were dependent on the support of the state and declined under Louis XV. In the third place the term factory was applied to establishments of a kind differing from both of those already mentioned: to the houses and settlements built by European companies in the seventeenth century for the protection and convenience of traders with Persia, Japan, India and the islands. The commercial rivalry between the European peoples took the form of a struggle over these factories. In the Spice Islands the Dutch got the better of the British; in India the British gained the advantage, and their few factories on the coast of Hindustan marked the beginning of their eastern empire.

Thus there were factories before the factory system. What is more, there were factories using water power to economize and supplement human labor. In the fourteenth century there were spinning mills in Bologna and paper mills in Nuremberg driven by water power. If capital

had been more plentiful and markets larger and easier of access, a factory system in the modern sense might have grown up at that time. But these conditions were not fulfilled until after the discovery of the Atlantic routes. That discovery brought fresh markets within the reach of Europe; it led to a great increase of wealth; it stimulated invention and organization. Hence it created the conditions under which the factory ceased to be a rare and interesting example of human ingenuity and became a normal feature of social life. The factory in the modern sense was the response of industry to the new demands made by commerce. It was the organization of effort on a plan which applied the principle of the division of labor in such a way as to make the fullest use of the resources of science.

The new opportunities of industry and the general spirit of the time had given invention a great stimulus, and it was natural that the early observers of the factory system should regard the use of machinery as its distinguishing feature. "The Factory System," says Ure in his *Philosophy of Manufactures* (London 1835), "designates the combined operations of many orders of work-people, adult and young, in tending with assiduous skill, a series of productive machines, continuously impelled by a central power."

On the other hand, a definition was given by Carroll D. Wright in his report on the factory system of the United States in 1883, which concentrates on the economical organization of effort without reference to machinery. "A factory is an establishment where several workmen are collected for the purpose of obtaining greater and cheaper conveniences for labor than they could procure individually at their homes; for producing results by their combined efforts which they could not accomplish separately, and for preventing the loss occasioned by carrying articles from place to place during the several processes necessary to complete their manufacture." But the economies described by Wright were of course immensely aided by machinery. Although factories which were essentially assembling plants using little machinery were not uncommon at one stage, the history of factory development is largely the history of progressive economies rendered possible by the development of machine production.

The earliest English factory in the modern sense is believed to have been a silk mill set up in Derbyshire about 1718 by a merchant named Lombe who had secured employment in a mill in Italy and brought back its secrets. But the

significant history of factory development begins with the inventions that revolutionized the cotton industry half a century later. When Arkwright patented a water frame in 1769, the decisive step in making the spinning of cotton a factory process was taken. In 1785 Watt's steam engine was used for the first time in a cotton mill, and as steam power gradually replaced water power all the spinning processes passed into the mill. The change in weaving was slower. But although these first steps were all taken in England, the first factory in which all the processes involved in the manufacture of goods were carried on by power in one establishment was set up in the United States. This was the factory at Waltham, Massachusetts, built in 1814.

The story of the spread of the factory system throughout Europe and the East belongs to the history of the industrial revolution (*q.v.*). With the introduction of railways the factory system developed on the continent of Europe. Toward the end of the nineteenth century it spread to the East, and the World War gave a great stimulus to its expansion in Japan, China, India and the countries of South America. The construction on a large scale of factories grouped in federations occupies an important place in the economic plans of the Soviet Union.

The factory system spread not only from country to country, but from industry to industry. During most of the nineteenth century the textiles, especially cotton, were the characteristic factory products. Gradually leather goods, metal goods, machinery, furniture, food and most of the other products of modern society have been drawn within the orbit of the factory system. Moreover, methods of work and principles of organization and management developed in the factory are being widely adapted to the extractive industries and even to agriculture.

Concurrently there have been changes in the nature of the factory itself. Thus the improvement of the early factories led first to a great increase in their size. Between 1860 and 1890, for instance, the number of cotton factories in the United States declined from 1091 to 905, but the value of their products increased by 179 percent and the number of spindles per mill by 227 percent. Such growth depended, however, on local conditions. Thus in Germany, where the domestic worker held his ground much longer than in Great Britain, as late as 1882 only 38 percent of the factory workers were in

factories employing more than 50 persons and 42 percent of all textile workers were in establishments employing less than five persons. In general the trend has been toward increasing size of plants especially in industries using heavy machinery, but smaller units have persisted in many types of operation. Concentration has gone furthest in the United States, where in 1923 one half of the wage earners in the country were employed by less than 4 percent of all the industrial establishments.

What is perhaps the most characteristic feature of modern factory production also had its beginning and has had its greatest development in the United States. In 1851 visitors to the great exhibition in London were struck by the exhibits from the United States, and two years later a report on American factory methods was drawn up for the British government by commissioners who made a tour of the industrial districts. The commissioners noted as a novelty the production in large numbers of standardized articles on a basis of repetition in factories characterized by ample workshop room and admirable system. Mass production of standardized articles, so conspicuous a feature of modern industry, had already begun. The World War stimulated the development of new methods of factory organization both in the United States and elsewhere. The introduction of automatic machinery had already made possible the elimination of many processes and many workers. War demands encouraged the further development of the production of standardized articles or parts. This was accompanied by a widespread development of the principles of scientific management (*q.v.*), a new attention to the importance of cost accounting systems and further study of the technical efficiency of the factory set up.

In earlier days there was a movement toward concentration of all processes under one roof, but in many industries today it is found to be more economical to separate processes and to employ different factories for the production of different parts. Thus the factory tends more and more to be a unit in vast organizations, the unit representing all that science and method can accomplish toward making one particular process as efficient and economical as it can be made.

The early British factories using water power were built beside streams in country places. These country factories, like the collieries and ironworks of the time, were the center of the social life of the district. The capitalist often

housed his workpeople, kept shops for their needs and provided apprentice houses for the pauper children who worked in his mill. The extreme example of this type of community in the modern world is the mill village in the southern states of America, where the mill owner owns the village, the dry goods store and the cinema and pays not only the parson, the doctor and the school teacher, but the policeman. Many of the factories in China, Japan and India, especially those owned by foreign capital, have been and are the center of similar mill villages. Such a system provides opportunities both for oppression and benevolence. One of the evils of factory life has been the frauds practised by employers in paying their workpeople not in money but in goods from their shops in spite of laws forbidding such practises. It has been still more difficult to restrain the power which the employer wields as a result of owning the houses where his workpeople live. On the other hand, this power was used sometimes for benevolent purposes even in the early days of the system. Robert Owen, the Ashtons, the Strutts and other early Lancashire families were able to raise the standard of social life in their neighborhood by providing schools, libraries, playgrounds and other amenities. When the factory passed into the town it ceased to be a self-contained society, but to some extent this tradition survived. Factory owners have often been pioneers in the provision of services later supplied by the public authorities. The extension of welfare activities was greatly stimulated by most governments during the World War, both in establishments, such as those of the British munition industry, which had been taken over by the government and in those still in private hands. The use of the factory as a center of social life has been developed most fully in Soviet Russia, where the government uses all its powers of organization and discipline to create a particular type of community.

Certain other social consequences of the factory system can be indicated only briefly. The factory system may be said to have abolished the problem of famine and to have substituted for it the problem of unemployment. Under the factory system as it exists in capitalist countries production is frequently ahead of consumption, and man's facility in making boots or window frames or motor cars has created a problem that human ingenuity has not mastered or even explained. The factory has brought with it changes in the nature of work: some agreeable, others

the reverse. Critics of the factory system point to the loss of pleasure in work consequent upon the change from handicraft to mechanical routine. The individual worker puts less of himself, his taste and his character into his task. This has given a special force and importance to the demand for shorter hours. The shorter working day has led in turn to greater attention to the amusements of life and the organization of leisure. A peasant people works long hours and finds its interest in its farm work, enjoying saints' days and festivals as diversions. A factory population works short hours and finds its interests in the occupations of its leisure. The factory then begins to provide for those occupations; gramophones and wireless sets are produced by mass production; and leisure, like work, becomes standardized.

The rise of the factory system and the dissolution of older forms of social regulation created a number of problems calling for new types of national and international regulation. Women and children were ruthlessly exploited in the early factories. But public opinion was more easily drawn to abuses in factories than to abuses in domestic workshops and hence parliaments and governments were persuaded to intervene. The first effective, although not the earliest, factory act in any country was that passed by the British Parliament in 1833, which provided for factory inspection. All industrial countries have followed the example of Great Britain. Even a late comer like Japan has a factory act for all factories employing more than fifteen persons or engaged in dangerous and unhealthy industry. A factory code has spread from country to country, much as the *Code Napoléon* spread a century ago. The establishment of the International Labour Office under the League of Nations made it easier to watch, record and stimulate this progress. It is less difficult to regulate conditions of employment inside factories than outside; the factory thus introduced new opportunities for improvement. Factory legislation, which began a century ago for the protection of women and children, has developed into a system of law for the protection of all factory workers, and it has been followed in recent years in certain countries by legislation for the protection of workers in agriculture and domestic industry.

All observers have pointed out that the factory system made combination among workmen much easier and thus led to a great development of trade unions. In a highly organized industry

at the present day the whole industry may be covered by organizations of employers and employed. In recent years there have grown out of the relations of these originally hostile bodies methods of consultation and even of self-government, which bring employers and employed together in the conduct of industry.

Not the least important of the changes created by the factory system is the change in the position of women, for whom it has provided employment on a large scale. Critics of the system in its early days denounced the employment of women as one of its chief evils, laying stress on their ill treatment but arguing also that such employment took them away from their homes and their natural occupations. When the worst abuses of the early factories were suppressed by law a different view began to prevail. Women gained in independence, they earned higher wages than in other occupations, and in time they took their place by the side of men workers in the trade unions.

In the western world there has been a partial adjustment to the dissolution of the older family ties involved in this change. In the East, where the family basis of social organization has been more essential, the factory system remains a disruptive element and its possible future social effects can hardly be estimated.

FAHLBECK, PONTUS ERLAND (1850–1923), Swedish political scientist, sociologist and statistician. Fahlbeck studied at the University of Lund, where he subsequently taught history, political science and statistics. From 1903 to 1911 he served as a conservative member of the Riksdag. In 1897 he founded the *Statsvetenskaplig tidskrift* (Journal of political science), which he edited from 1900 to 1918. In 1918 he established the Fahlbeck Foundation for the study of political science, statistics and economics.

Fahlbeck began his scientific work with a historical study of the social and political structure of the earliest Frankish kingdom. In subsequent studies in political science he used the historical and typological methods to discover the realities in the various types of constitutional government. In *Sveriges författning och den moderna parlamentarismen* (Lund 1904; tr. into French as *La constitution suédoise et le parlementarisme moderne*, Paris 1905) he pointed out contrasts between the Swedish and English systems and some interesting analogies between the constitutions of Sweden and the United States. Fahlbeck introduced modern statistics as an independent science in Sweden. His most important work was a study of the noble families of Sweden and Finland, *Sveriges adel* (2 vols., Lund 1897–1902; German ed. Jena 1903). His first contribution to sociology was *Stånd och klasser* (Orders and classes) (Lund 1892), in which he criticized socialist doctrines and advocated a positive program of social reform similar to that of German socialism of the chair. His last and unfinished work, *Klasserna och samhället* (The classes and society) (Stockholm 1920; German ed. Jena 1922), maintains that social differentiation accompanies and is a product of the development of culture. Fahlbeck's writings exhibit a wealth of ideas and a brilliant style.

GUNNAR ASPELIN

Consult: Wallengren, Sigfrid, in *Statsvetenskaplig tidskrift*, vol. xxvi (1923) 211–28; Widell, Louis, in Institut International de Statistique, *Bulletin*, vol. xxii, pt. i (1926) 318–20.

FAIDHERBE, LOUIS LÉON CÉSAR (1818–89), French colonial administrator. Faidherbe was made a lieutenant in the engineers in 1842,

and after discharging duties at Guadeloupe and in Algeria that fitted him for a colonial career he went to Senegal in 1852 and was made governor at the request of the colonists. He became governor of Senegal in 1854, serving until July, 1865, except for an interval of eighteen months. When he reached Senegal European occupation of tropical Africa was still largely confined to declining trading posts on the coasts. Colonial policy was dominated by a spirit of indifference or even retreat. The French possessions on the west coast comprised the city of St. Louis at the mouth of the Senegal and the isle of Gorée, near Cape Verde. For the right to trade with the natives of the interior France paid a tribute called custom (*coutume*) to a certain number of chiefs, who failed to maintain the peaceful obligations they had undertaken under an ineffective treaty making policy adopted by France. Faidherbe determined to put a stop to this situation and to establish French authority throughout Senegambia. By force of arms or negotiations he subjugated the left bank of the Senegal River, a key to the continent, as far as Medina, the head of navigation. He subjugated similarly Cayor, a region that extends along the coast from St. Louis to Cape Verde. Visualizing a French empire in the interior he made preparations for linking the upper Niger with the Senegal and for acquiring the Sudan. The extent of the subject territories when he left Senegal almost equaled that of France. The foundations of French West Africa, a vast territory whose coast line France shares with other powers, had been laid. He put into effect a broad program of colonial improvements, transformed the city of St. Louis, established a port at Dakar and village settlements for liberated slaves, endowed the colony with schools to train natives to aid the French in governing, with post and telegraph offices, hospitals and even a museum. He urged the policy of native proprietorship which France has adopted in west Africa. He accomplished this work with the aid of but few troops: there were never more than a thousand white soldiers at his disposition. In 1865 he returned to Algeria for five years. He was commander of the army of the north in 1870–71. Faidherbe became a deputy in 1871 and in 1879 a senator. He is the author of numerous books on geography, ethnology, colonization and military technique.

FAIR RETURN. The concept of fair return on property is a compound of two variables, the value of the property and the rate of interest or profit. The first is the rate base; the second is the rate of return on that base.

In all the regulative opinions regarding either the rate base or the rate of return there is in the background a concept which in law is the principle of "a willing buyer and a willing seller" and in economics is the concept of a "normal" competitive price. The courts or commissions set up the ideal of mutuality, absence of duress and stability of expectations, which is substantially the individualistic ideal assumed by the classical and hedonic economists in their notions of natural law, liberty of the individual, private property, marginal utility and normality. When this normality is disturbed by the substitution of corporations for individuals or by the expansion of "natural" monopolies or by the extraordinary circumstances of war or by the general inflation or deflation of prices, then not only do the public or the property owners demand but legislatures, commissions and courts attempt to enforce some kind of standard of fair return. Such a standard is at first sought in the precepts of the common law, derived from the customs of the time or from the ideals of free competition among equals on which economists based their theories. But with the modern concepts of "going value," "going concern value" and the bargaining power of concerted action, along with the controversial testimony of engineers and accountants, the wide and fluctuating differences between prices, risks, rates of interest, and between bonds, common stocks, preferred stocks and "watered" stock as well as the extremely long term periods of investment, the simpler ideas of the common law and free competition call for revision in the midst of nationally conflicting interests and the urgency of fitting the early ideas to the high complexity of the new capitalism.

One of the first encounters of the old simplicity with the new complexity appeared in the decision of the Supreme Court in the case of *Smyth v. Ames* [169 U. S. 466 (1898)] relative to the rate base. That decision, notwithstanding its ambiguity and contradictory economic prin-

ciples, served to declare confiscatory and unconstitutional an act of the Nebraska legislature reducing freight rates on a certain railway. The court declared that a "fair return upon the value of that which [the company] employs for the public convenience" should take into consideration such matters as original cost, cost of improvements, market value of stocks and bonds, cost of reproduction, probable earning capacity under the prescribed rates, operating expenses, all of them "to be given such weight as may be just and right in each case." The problem of determining the rate base in accordance with the ambiguous rule laid down in this case still remains (*see* VALUATION).

Besides the difficulty of determining the rate base in the face of inflation and deflation of prices there is another complexity in the concept of fair return introduced by the methods of financing corporations. If the rate of return allowed by a commission is 7 or 8 percent on the rate base and if in a hypothetical financial structure one half of the money is represented by bonds paying 5 percent and one quarter by preferred stock paying 6 percent, then the rate of return allowed on the risk bearing common stock is 12 or 16 percent.

This indicates the importance of certainty of return in reducing the rate of return. This is especially true of public utilities where the investment is large compared with sales income and where therefore interest is a large part of the cost of service. It is for this reason that in providing for fair return in public utilities both the states and the federal government have endeavored to reduce or eliminate competition and to give to the companies a legal monopoly free from competition or even threats of competition. It is altogether unlikely that the idea of a fair return can be reduced to administrative measurability if actual or potential competition is allowed to interfere in the calculations. Because of the complexity of corporate securities and the ups and downs of business cycles there is nothing that can be said to be a fair return in normal circumstances in a competitive business. Something can be said of changing averages but nothing of norms. Of approximately 70,000 manufacturing corporations in the United States the average net income for common stockholders as calculated by the writer from the Internal Revenue Statistics on Corporate Taxable Incomes has ranged from about 7 percent profit on sales in 1919 to 3 percent loss on sales in 1921. This includes individual corporations whose rate of

profit may have been 50 or more percent. There is evidently no possibility of figuring out a normal rate of return in competitive business to be used as a standard for fair return in the regulation of public utilities. Yet by eliminating competition and by the investigation of each utility on its own merits something of an approach to the idea of a fair return may be calculated.

The first principle developed in these investigations is the "capital inducement" principle. A rate of return is fair if it will induce investors to transfer their capital from other enterprises to the particular utility in sufficient quantities to serve the public convenience. With security for bondholders the rate of inducement on that class of capital may be reduced. So with the rate of inducement on preferred stock. There remain for common stock, when relieved of the risks of competition, only the risks of efficient or inefficient management.

Here the problem of a fair return slips into the realm of immeasurable opinion, for the capital inducement principle becomes also a principle of managerial inducement requiring the prospects of a return adequate to reward efficient management and discriminating against inefficient management. To the extent to which common stock is found on investigation to represent actual investment the capital inducement principle may be applied by reference to the rate of yield on the market value of bonds; but to the extent to which common stock represents management the highly variable and fluctuating managerial inducement is a matter of opinion.

To meet this uncertainty a sliding scale has been adopted in a few cases, the principle being that a given reduction in price to consumers shall be accompanied by a specified increase in dividends to stockholders. Under such arrangements the fair return to managerial capital (the voting stock) is calculated in advance as a precise sharing of increased efficiency between management and the public.

The sliding scale has not been adopted generally, although it might be further extended where competition is wholly eliminated. But in many cases competition cannot be eliminated owing to alternative inventions. These are evident in the increasing competition of the motor bus and the automobile with railways and street cars. A fair return on the capital invested in railways and street cars cannot usually be maintained if the public is to have the advantage of the new inventions. The reasons here, however, are partly historical, going back to the financial

structure of the past, which failed to take into account obsolescence as a factor in the rate base, thereby reducing the amount of capital instead of maintaining it on the books. Or, if cost of reproduction is used as the measure of the rate base, the same factor of obsolescence is not adequately considered in reducing the estimate of capital required to the point where a fair return upon it can be maintained. Barring this factor of obsolescence, the method of writing down capital in a competitive economy is the method of bankruptcy or reorganization; but including this factor, the method of writing down capital in a regulated economy is an administrative process of controlling the accounts, the sales of stock, the allowances for depreciation and obsolescence and the like.

In whatever way the rate base is calculated there emerge the concepts not only of fair return but also of excess return and inadequate return. Three methods of dealing with excess returns have been adopted in the United States, depending upon the social interest involved. If the excess return derives from ordinary competitive business under exceptional circumstances, such as war, then the "excess profits tax" is adopted as a means of distributing to all taxpayers the excess in the form of lower taxes on the others. If the excess return derives from a natural or legal monopoly then it is distributed to consumers in a reduction of prices. But if the excess return develops from the public policy of fixing uniform rates for a small number of competing companies, as in the case of competing railways, then the excess is loaned from a revolving fund to the companies whose returns are inadequate at the rates fixed by law.

The latter method is exemplified in the "recapture clause" of the Transportation Act of 1920. Evidently the amount of excess recaptured depends on the rate base; and the O'Fallon case turned on this point, the Interstate Commerce Commission adopting the split inventory appraisal, or modified prudent investment theory, which at that time yielded a larger excess profit than the reproduction cost theory adopted by the Supreme Court [124 I. C. C. 3 (1927); 279 U. S. 461 (1929); I. C. C., Finance Docket 3898, Richmond, Fredericksburg and Potomac R. R. Co. (1931)].

Evidently the intricacy of the problem of fair return has emerged in the change of the constitutional meaning of property which the United States Supreme Court introduced in 1890 (*C. M. and St. P. Ry. Co. v. Minn.*, 134 U. S. 418),

and which gave the Supreme Court jurisdiction over the issue. Confiscation of property after that date became the "taking" of property by reducing prices; and since fair return depends partly on prices charged, the Supreme Court in *Smyth v. Ames* included as one of the factors in its definition of fair return "the probable earning capacity of the property under particular rates prescribed by statute."

On account of the judicial supremacy in the United States the practices of countries having legislative supremacy include little or nothing which is parallel to the American effort to ascertain a fair return on capital. The legislatures adjust the rates of public utilities according to other principles of public policy; or, as in the case of cartels, the matter of obtaining a rate of return is left to the concerted action of private parties. Fair return is not a major issue.

Nor is it in the various schemes proposed or practised for the nationalization or socialization of public utilities. At the one extreme is the public policy of distributing the benefits to the wage earners or consumers (as in the form of post offices or free highways) with no return whatever to the taxpayers as investors who furnish the funds. At the other extreme is the policy of using the public monopoly as a profit making enterprise to relieve the taxpayers at the expense of consumers. In neither case does the issue of fair return arise.

FAIR VALUE. *See* VALUATION.

FAIRS are institutions established to centralize supply and demand of merchandise at a particular place and a particular time. The main

differences between fairs and ordinary daily or weekly markets are that fairs take place at much greater intervals and last for longer periods, that they are of importance to buyers and sellers over a far greater area and that, although retail trade is by no means excluded from them, they mainly serve for wholesale trade. They are considerable events in the life of the districts where they take place, for people come to them from remote regions to buy and sell and to visit the various side shows which accompany them. Fairs differ from the modern produce exchanges in that they are occasional rather than daily and in that the goods to be sold are brought to fairs and acquired there after preliminary inspection to ascertain quantity and quality, whereas on exchanges goods are dealt in on a basis of samples or defined grades of given wares usually set in conformity with established standards. In the course of time, however, transactions at fairs have also come to be effected on the basis of samples, so that goods need no longer be transported to the fair. Trading at fairs, however, has never come to be based on standards, since the goods dealt in are chiefly finished products to which the standard system cannot readily be applied.

Fairs also have some points in common with expositions and sometimes expositions are called fairs. The main distinctions between them are that expositions generally take place at far greater intervals than fairs, last longer and are intended more as a mode of advertisement to acquaint people with the latest technical achievements and industrial progress rather than for immediate trading. In recent times special sales of individual business concerns in Europe have been called fairs, but properly speaking a fair is a large scale enterprise involving numerous interests and under some form of public or group regulation. The American or English county fair is not a fair in the technical sense but rather a produce and livestock exposition combined with public amusements.

Fairs arose not only because they offered special facilities for trading but also because trade when still little developed could not be carried on continuously but only at such times as quantities of goods had accumulated. Although the origin of fairs goes back to remote times, it is difficult to use the term to characterize the exchange of property in primitive society, which usually took place incidentally on festive occasions to which neighboring tribes came with their goods. Borderland markets were adopted

by some North American Indian tribes and were sometimes comparable to fairs.

In the ancient world annual fairs as well as boundary markets were held at neutral sites, in or near temples at a time of religious feasts and under the control of priests, chiefs or officials in order to guarantee security of exchange. Many of the religious feasts of Syria, Palestine, the Mesopotamian valley, Egypt and Arabia were visited by caravans of Phoenician merchants. In ancient Greece, besides the daily, weekly or monthly boundary markets mentioned by Demosthenes and sacred because they were under the protection of market gods, there were held once or twice a year fairs closely connected with the feasts celebrated in honor of the principal gods. Merchants coming to them were regarded as protected by these gods and thus security was guaranteed them during travel and for the duration of the fair. Pausanias describes the spring and autumn fairs held at Tithorea during the feasts in honor of Isis. On the second day of the feast merchants opened their wooden booths and stalls and on the third traded in slaves, cattle, garments, gold and silver. The Olympian and Isthmian feasts were similar. In the Roman era fairs connected with feasts and multitudinous gatherings took place on the Aventine hill, near the temple of Voltumna in Etruria and in the holy grove of Feronia.

Among the ancient Germans trade seems to have been largely an exchange of gifts by kings, popes, bishops and abbots. Before the eleventh century in so far as trade went on it was effected by the wandering merchant or peddler (*mercator cursorius*) and presented the characteristic features of boundary trade (*commercium in ripa*). Under Charlemagne markets were held on the *limes*. Denizens seldom took to trade, and originally the bulk of the trade of these countries was in the hands of Arabs, Jews, Saxons and other foreign merchants. Exchanges were effected either in or before churches (*ecclesia forensis*, *ecclesia mercatorum*), under the protection of the peace of God (*pax Dei*) or the king's peace (*pax regis*), at particular times (*constituta mercata*) when the usual animosity toward aliens did not display itself, as on days when divine service was celebrated, especially Sundays, or on days when merchant caravans (*manus negotiatorum*) arrived. This practise found symbolic expression in the cross (or some other object, as a sword, a flag or a glove) displayed on the opening of the market (*mercatus*) and left there till its close to indicate that it was under royal or divine pro-

tection. Bargains were concluded in the presence of a royal official and of witnesses, as ordered by the capitularies of Charlemagne. To those who traded in these places the protection of the king and of the church (hence "king's merchants") was vouchsafed anywhere within a mile of the market place (the so-called *Bannmeile*) and on the road to the market ("king's roads") as long as the market lasted and for a fixed time, usually forty days, after its close. Every infraction of the rules was immediately and severely punished by the judge there present.

Fairs came into existence at some local markets—those, for instance, situated in places where merchant caravans had to halt to change their means of transportation or those where multitudes of people assembled at particular times, as for religious feasts. The very terms employed (fair and *foire* from *feriae*, *Messe* from *missa*, *dult* from *indultum*) bear evidence of the close connection between fairs and the Christian church. Similarly, in the Arabian world pilgrimages and commercial traveling were closely connected; such places as Mecca to which people flocked for the sake of relics there preserved became centers for fairs.

The fair of St. Denis near Paris was chartered in 629 and soon became important; in the eleventh century the Easter fairs of Cologne flourished. The oldest Italian fair was that of Ferrara.

Fairs of merely local significance (the German *Jahrmarkt*) at which trade was to a large extent retail must be distinguished from those where trade was chiefly wholesale (the German *Messen*). The latter concentrated the trade of large areas and sometimes were of international significance. Some fairs, while mainly for wholesale trade, served a small area like retail fairs. This type, however, differed from both other groups in that merchandise of only one or two types was dealt in, as at the English cloth fairs in Leeds, Exeter, Halifax, Bradford and Wakefield. In England and France the same term (*foires*) was used to designate all types.

From the middle of the twelfth until about the middle of the fourteenth century the most important fairs were those of Champagne. In the county of Champagne, situated on the borders of Germany, France and Italy, converged the main roads leading from the Mediterranean up the Rhone valley to Germany and England. Still more important, Champagne was politically neutral, being independent of France, and did not suffer from the prevalent and devastating wars. In this neutral zone six annual fairs were

held, two at Troyes and the others at Brie, Provins, Bar-sur-Aube and Lagny. Here merchants from Italy and southern France offered to those of northern Europe the drugs, spices and perfumes of the Orient in exchange for Flemish and, later, English cloths, the linen of south Germany, the furs and other raw products of Russia. The prosperity of the Champagne fairs was largely due to the policy of the counts of Champagne, who did much to regulate trade, to assure the merchants security and to guarantee the rapid settlement of commercial disputes by a special court. The latter, composed of the *custodes nundinarum* (*gardes des foires*) recruited by the counts' officials among the heads of the merchant corporations at the fairs, was highly respected and its judgments on the payments of debts concluded at the fairs did not, as was frequently the case in that day, remain on paper but were strictly enforced. Towns whose merchants did not yield to these judgments were officially banned from visiting the fairs; such proud and mighty towns as Florence, Lucca and Cologne had at times to submit to this measure. From the beginning of the fourteenth century the Champagne fairs began to decline. Champagne, now a part of the French kingdom, shared in the devastations of the wars with the Flemish dukes and with England. These wars also prevented Italian (Lombard) and German merchants from visiting the Champagne fairs as regularly as before. Moreover, the royal tolls and dues imposed on foreign, especially Italian, merchants were much heavier than those levied previously by the counts of Champagne, and the Italians were now repeatedly banished or expropriated. Trade between northern and southern Europe therefore largely shifted to the sea route leading from Italy through the Straits of Gibraltar. In 1314 the first Venetian galley safely arrived at Antwerp, and soon regular voyages were made between Italy and Flanders. Antwerp, Bergen op Zoom and Bruges all became important centers of trade and held fairs.

In the fourteenth and the early fifteenth centuries the Geneva fair, first mentioned in 1234, partly replaced those of Champagne. Geneva benefited from its favorable geographical situation near the borders of France, Italy and Germany where the routes from Basel, Constance, northern Italy and England converged. In 1420 a fair was established at Lyons which soon began to compete sharply with Geneva. Any privilege which the French king granted to the Lyons fair was balanced by some favor given by the

duke of Savoy to the Geneva fair, but by the close of the fifteenth century Lyons had the upper hand.

Although the bulk of the trade formerly effected at the Champagne fairs was thus distributed among many places and merchants now traveled much more than formerly, most fairs still had but local significance. In France the most important after that of Lyons were those of Rouen, Châlons-sur-Marne, Nîmes, Toulouse and, particularly, Beaucaire at the mouth of the Rhone. The most important local Flemish fairs were those of Messines, Lille and Ypres. The largest German fairs were at Frankfort, Nördlingen, Strasbourg and Bozen. In Italy the fair of Ferrara was declining and the great fairs were those of Piacenza, Pavia and Milan. One of the chief Swiss fairs was held at Zurzach. The most important English fair, that of Stourbridge, attracted Italian, Spanish and Flemish merchants; other large fairs were those of Westminster and Winchester.

Since the essential features of a fair—the periodic accumulation of wares, the temporary gathering of merchants and the granting of special privileges to them—were withheld by Venice and the Hanseatic towns, which wanted to play an active trading role, these towns cannot be said to have had fairs, although trade went on and merchants were assembled in them throughout the year.

The main grants given to foreign and native merchants at fairs consisted in permission to deal among themselves (*von Gast zu Gast*) and to sell at retail, practises strictly forbidden at ordinary times. In the course of time a code of international merchant law gradually adopted by all fairs grew up. According to this law fairs were an asylum where no one was liable to prosecution for offenses committed elsewhere. Hence debtors could not be arrested at fairs nor their merchandise be seized. Moreover, the so-called right of reprisals was abolished at fairs; i.e. merchants at fairs were not responsible for debts contracted or offenses committed by their countrymen elsewhere. The most important privilege granted merchants was that their disputes were expeditiously settled by a special court without observance of the usual complicated procedure. In England this court was called the court of Piepowder (*cour des pieds poudrés, curia pedis pulverizati*) from the dusty feet of traveling merchants.

As merchants met at fairs regularly, the payment of debts even if contracted elsewhere was

usually set for fair time. Money changers and bankers (*cambiatores*, *campsores*, *bancherii*, *tabularii*), mostly Italian, gathered there to conduct a business as lucrative as it was difficult and intricate because of the chaotic state of currency, the repeated debasement of money, the variety of coins circulating and the quantity of false money issued. Frequently exchange did not take place on the spot (*cambium manuale*), but payment was effected at another time and in another place (*cambium per litteras*). The fairs thus stimulated the use of the bill of exchange as an important currency instrument in inter-local trade. At the Champagne fairs strict rules were set up for the presentation, acceptance and payment of bills of exchange. In the sixteenth century credit operations became prevalent at Lyons, Medina del Campo in Castile and some other fairs. They formed the bulk of business at the "Genoese fairs" (so named because they were mainly visited by Genoese bankers) held four times a year from the beginning of the sixteenth century at Besançon and Chambéry (Savoy), later at Rivoli and Asti and finally at Piacenza and Novi. The credit operations effected at these and at the Castilian fairs were chiefly concerned with Spanish royal finances. Large sums were paid out by the kings' bankers, who were repaid in Spain when the silver flotillas arrived from America. In dealings among themselves the bankers made use of "clearing" or *riscontro* (*scontro*) by simply making book transfers, a method already used in Champagne.

By the close of the eighteenth century permanent, non-periodical trading centers (shops and markets) especially in manufactured wares rapidly increased, chiefly through the development of canals, regular posts and other improvements in communications. Nevertheless, periodical concentration of trade in particular places and at fixed times remained necessary, as only thus could supply and demand be concentrated on a large scale, the situation of the general market be investigated and prices fixed in accordance with it. Besides, such mediaeval restrictions as those on the carrying on of trade by aliens, by craftsmen not belonging to local guilds and by peddlers were still enforced except at fair times. Thus the fairs, where everyone, denizen or stranger, might sell wares of any kind and origin, at wholesale or retail, appeared as supports of freedom of trade and in every town of importance were held once or twice a year.

During the seventeenth and eighteenth centuries most European countries had from ten to

fifteen wholesale fairs of national importance, the principal of them being held at Stourbridge and Bristol in England, at Beaucaire, Bordeaux, Rouen and Lyons in France, at Leipsic, Frankfort on the Main, Frankfort on the Oder and Bozen in Germany, at Novi and Senigaglia in Italy. The fairs of Antwerp and Geneva still prospered and important fairs were held at Puerto Bello, Vera Cruz and Havana whenever ships arrived from Spain. The local, retail fairs were much more numerous.

Of all fairs held during the seventeenth and eighteenth centuries the most important were those of Stourbridge and Leipsic. The latter were established in 1507 and held three times a year. At Leipsic the main roads of central Europe converged; Hungarian, Russian and Polish merchants came there to meet Italians, Dutch, English and Greeks. In the eighteenth century even Frankfort on the Main, an important fair center since the thirteenth century, was eclipsed by Leipsic, chiefly because of the realization of principles of freedom of trade and equal treatment for natives and aliens, who were even allowed to trade in the intervals between the three annual fairs. An annual fair trade of between 5,000,000 and 8,000,000 thaler was done. At Leipsic credit operations were but an auxiliary of merchandise dealings, while at Frankfort they were the chief item.

Especially in the eighteenth century much business formerly done at fairs was diverted from them by the increase of peddling through the countryside; the rise of settled urban retail trade; the growth of new forms of wholesale trade, such as the purchase of raw and manufactured goods direct from the producer's storehouses; and by the establishment of auctions. The latter were similar to fairs in that they took place at fixed times and in regular places but differed from them in that the time was not set long in advance but according to the arrival of goods for sale. Moreover, late in the eighteenth century commercial travelers began to visit towns and villages carrying samples with them and offering to deliver wares to the home or shop of the buyer, thus making a trip to a fair unnecessary. With the development of modern industry, modern roads and railroad systems the purchase of goods after a preliminary examination was more and more replaced by contracts based on the examination of samples of standard goods to be delivered by railroads. With the development of postal communication, telegraph and telephone fairs declined more and

more. Moreover, in the course of the nineteenth century the restrictions which made fairs appear as asylums of freedom of trade were abolished and free competition became universal.

Fairs soon lost importance for credit operations, which began to be performed at stock exchanges, banks, clearing houses and post offices. A rapid decrease in merchandise trading followed and many fairs ceased to exist, until by the end of the nineteenth century the only important fairs of the traditional type were to be found at Hardwar in India, Tanta in Egypt, Mecca in Arabia and in Russia.

In Russia, which had a slow economic development, the numerous fairs remained important longer than in other European countries. In the seventeenth century important fairs were held at Archangel, when English and Dutch vessels arrived to exchange their cargoes for Russian products. The ancient fair originally held at the cloister of St. Makariev and transferred to Nizhni Novgorod in 1817 became the center of Russian internal trade as well as of trade between Russia and Asia. Originally and for a long period tea brought by caravans from Kiakhta on the Siberian highway appears to have been the principal object of trade at this fair. Later textiles became prevalent. Moscow manufactures were sold at wholesale and retail and large transactions were made by dealers in flax, hemp, wool, leather, feathers, horsehair and the products of artisans working on the "domestic system." At the close of the nineteenth century these fairs were still prospering, the bulk of business being in textiles, furs, cotton, silk, leather and wool. With the first development of railroads the volume of Russian fair trade increased and the fair of Nizhni Novgorod continued to be the "fair of fairs," supplying local fairs. Gradually, however, the development of the railroad system and the rise of commercial travelers brought about steady trade of the modern type and the fairs of Nizhni Novgorod began to dwindle. Dealings began to be effected on the basis of samples, and goods were purchased at the place of production or at the center of trade, Moscow. Nevertheless, the reluctance of provincial merchants to give credit to new customers enabled numerous small local fairs to grow up and preserved for the fairs of Nizhni Novgorod some importance as a center where buyers and sellers met to cement existing commercial relations and to establish new ones. Moreover, the fair remained a center for the delivery of goods and the clearing of accounts.

But by 1914 it had entirely lost its former importance for the cotton, sugar and iron trades, while dealings in tea, silk and tobacco were rapidly decreasing. The average general turnover of this fair dropped from 220,000,000 rubles between 1875 and 1880 to 204,000,000 between 1906 and 1910. Of the other Russian fairs those of Irbit, Orenburg, Kiev, Kharkov, Poltava and of Ishim and Tyumen in Siberia were important. At the Irbit fair, established in 1643, the bulk of the business was in tea, metals, leather, wool and furs; for the last named ware it remained important even after the building of the Trans-Siberian Railway, and Leipsic and London obtained their fur supplies there.

During the nineteenth century the fair in western Europe underwent a change. The wholesale division became increasingly important and the practise of bringing to the fair samples rather than a store of goods for immediate sale became general. Only the Leipsic fair remained important and this only for a limited number of wares (chiefly furs and leather) requiring preliminary examination and as a sort of permanent exposition of vast collections of samples, drawings and models where orders might be placed. As such it was an important instrument of German commercial expansion, drawing several hundred thousand visitors, many from abroad, each year. In 1894 the Leipsic fair became definitely an international sample fair (*Mustermesse*). During and just after the World War a renaissance of fairs occurred throughout Europe because of the wartime goods shortage and the difficulties of communication. The Leipsic fairs, suspended in the first years of the war, recovered their former prosperity and smaller fairs were held at Kiel and other German cities. To fight Germany on the economic front and to foster new industries, mainly those for which the Entente states formerly depended on Germany, fairs were established during the war in London, Birmingham, Glasgow, Lyons, Paris, Bordeaux (largely for colonial trade) and elsewhere. Thus the World War among other ways compelled a return to the economic system of bygone days by resuscitating the once typical fairs, which again appeared as asylums of free trade due to the relaxing of the innumerable wartime prohibitions and restrictions imposed on trade, the right of residence of foreigners and the like. All these fairs were chiefly sample expositions. For dealings in such standardized, half finished and finished products as could be sold on a sample basis they replaced or supplemented

traveling salesmen. The prolonging of many trade restrictions after the war, the fact that until 1924 or later commercial treaties were concluded for short periods only and the necessity for renewing old commercial connections broken by the war as well as establishing new ones led to the continuation of these fairs; during or just after the war there were three such fairs in England, six in France, three in Italy, seven in Germany, seven in Austria-Hungary and others in Sweden, Belgium, Switzerland, Holland, Poland, Czechoslovakia, Finland, Spain and Rumania. In 1920 the French industries held a sample fair in Basel to attract foreign trade. Some fairs have been transformed into expositions limited to particular merchandises and accessible only to visitors concerned with the given industry. There are today about 160 such fairs in Europe, of which that in Leipsic remains the most important. The German *Ostmesse* established in Königsberg in 1920 has the special aim of building up German trade in eastern Europe and of helping to maintain German control of East Prussia. Outside Europe few fairs, in any strict sense of the word, are held, although special trade fairs (for tobacco products, automobiles, radio materials, textiles and the like) are common in the United States. The Royal Easter Show of Sydney, Australia, and the Canadian National Exhibition of Toronto, both annual events, are in part sample fairs. Fairs are held annually at Bandung, Batavia and Surabaya in the Dutch East Indies.

As a result of the revival of fairs there arose a number of pressing problems concerning the application of tariff regulations to international shipment of fair samples, the conflict of fair dates and an overabundance of fairs, which was threatening to become a burden on trade. In order to rationalize exhibition practises an agreement was drawn up by an international conference in 1928, ratified by Albania, France, Germany, Great Britain, Italy, Rumania, Sweden and Switzerland and put into force on January 17, 1931. While this agreement does not regulate fairs, because of the attitude of the International Chamber of Commerce, which opposes government interference with what it regards as purely economic markets, the International Committee for Exhibitions and Fairs has made proposals for regulation and the chamber is attempting to facilitate voluntary international action to rationalize the holding of fairs. In 1924 and 1925 Latvia, Lithuania, Finland and Poland undertook to fix fair dates in such a

way as to avoid conflicts, and to facilitate and reduce rates on shipments of goods to fairs.

In Soviet Russia after a three-year interval (from 1919 to 1921) fairs, especially that of Nizhni Novgorod, were again held; but their utility was slight in a system in which private trade plays a small part in comparison with state trade, and in 1930 all Russian fairs were abolished.

In most European countries today fairs are managed by a bureau of public or semipublic character. The Leipsic fair, for example, is recognized by law, governed by an official bureau and financed by contributions from the federal and state governments and the Leipsic Chamber of Commerce and by fees paid by exhibitors. In addition to providing technical management for the fairs such bureaus undertake publicity campaigns to attract both exhibitors and visitors. The publicity of the Leipsic fair is perhaps the most extensive. In addition to issuing several publications the fair bureau utilizes all the forms of modern advertising in every important communication center both in Germany and abroad. Several foreign offices are maintained to distribute publicity and assist foreign manufacturers in making arrangements to send exhibitions to the fair. These offices are supplemented by the services of honorary officials throughout the world. The latter are business men of standing in their communities, generally persons in the employ of a German business firm or engaged in exporting to Germany, who volunteer to push the interests of the fair.

National governments have recently lent their assistance to the development of fairs. Whereas the English Fairs acts passed between 1868 and 1871 provided machinery through which useless fairs might be abolished, the Department of Overseas Trade now contains an Exhibitions and Fairs Division which is interested in promoting fairs wherever possible. Similarly the German government has established the *Reichskommissariat für das Ausstellungs- und Messewesen* and in 1920 it cooperated in a conference of fair officials and representatives of chambers of commerce which endeavored to systematize fair practises. Numerous other countries have either official fair bureaus or national associations established by commercial interests to promote and regulate fairs.

FALLMERAYER, JACOB PHILIP (1790-1861), German historian. Fallmerayer traveled extensively in the Orient and devoted himself chiefly to the study of the history of the Near East. His *Geschichte des Kaiserthums Trapezunt* (Munich 1827) laid a firm foundation for the study of the Trebizond empire and revealed many interesting social problems which have not yet been satisfactorily solved. His famous *Fragmente aus dem Orient* (2 vols., Stuttgart 1845; new ed., 1 vol., 1877) presents a charming picture of the life, customs and manners of many countries of the Near East. The most important work of Fallmerayer is his *Geschichte der Halbinsel Morea während des Mittelalters* (2 vols., Stuttgart 1830-36). In this work he advanced the astounding theory of the complete extermination of the ancient Greeks in the Middle Ages and their replacement by new and alien ethnographic elements chiefly of Slavic and Albanian origin. He stated that "the Hellenic race in Europe is completely exterminated" and that "not a single drop of pure Hellenic blood flows in the veins of the Christian population of modern Greece." Fallmerayer's work aroused a storm of discussion chiefly because it was published at a time when all Europe was watching, with a sympathy which was largely a result of the belief in the racial identity of the Greeks with the ancient Hellenic peoples, the struggle of the modern Greeks to maintain their independence. Fallmerayer's theory as a whole cannot be accepted. Its importance rests on the fact that it called the attention of many scholars for the first time to the Slavic penetration as well as to the later vast Albanian immigration into Greece. These new ethnographic non-Greek elements in Greece have considerably affected the local conditions and created new problems concerning the social and economic intercourse between the ancient local population and the newcomers.

FAMILY

PRIMITIVE. The organization of the family among primitive peoples has usually been studied with the primary objective of reconstructing forms which are antecedent to existing types. Hypothetical sequences have been developed by the use of three principal lines of inquiry; the Christian monogamous family has been regarded as the end product and ideal type and other existing types of family organization have been scaled and dated chronologically according to the degree to which they differ from this ideal; analogues from the animal kingdom have been made with special reference to the mating behavior of the anthropoids; and by the use of peculiar and anomalous aspects of contemporary primitive social organization as clues reconstructions have been attempted of early stages of family organization which are without existing representative examples. Lewis Henry Morgan, with the theoretical naïveté of the early evolutionists, constructed an evolutionary scheme according to which promiscuity was followed by group marriage, group marriage modified into polygamy in which matriliney preceded patriliney, and monogamy was the final stage. Westermarck in refuting Morgan's position argued that man was originally monogamous, relying for proof upon selected examples of monogamy among the anthropoids and the fact that hunting and food gathering peoples, whom the social evolutionists consider most primitive economically, were pre-vaillingly monogamous. Briffault, who has recently revived the discussion, uses all three methods of inquiry to produce a scheme less crudely evolutionary than Morgan's but open to the same fundamental objections. He utilizes the evidence of survivals, arguing that such institutions as the sororate, the levirate, sex hospitality and the exchange of wives point to an early stage of group marriage upon which matriarchal institutions were superimposed, that due to the exigencies of property rights patriarchal institutions followed and that finally monogamy was established as a matter of religiously sanctioned morality. He dismisses monogamic institutions found among economically simpler peoples as different in kind by explaining them as economically, not morally, determined. As Westermarck selected evidence of monogamy

from among the anthropoids, Briffault draws heavily in support of his thesis from conflicting data on anthropoid behavior which supplied evidence for the existence of horde life and no permanent unions.

All of these attempts to reconstruct the earlier forms of organization of the family remain at best only elaborate hypotheses. Contemporary refutations of these hypotheses rest upon criticisms of the evolutionary position with its arbitrary postulation of stages and upon a methodological refusal to admit the discussion of a question upon which there is not and cannot be any valid evidence. Customs previously considered survivals are not interpreted as evidence of previous and vanished states of social organization but are studied as functioning institutions. Evidence from animal behavior is not judged as conclusive concerning human behavior on the ground that human beings as a distinct species may have developed or discarded any part of the instinctive equipment of cognate species.

There is no such institution as the "primitive family"; many and diverse types of family organization exist, some of them close analogies to modern forms. Realistic contemporary discussions of the family among known primitive and civilized peoples have assumed that the biological family—father, mother and children—has been the fundamental unit, overstressing the conspicuous importance of this unit in an attempt to refute the early views which regarded the clan not as extensions of the primary family group but as a primary group from which the family had become differentiated. This point of view has resulted in such analyses of social organizations as Malinowski's treatment of the aboriginal Australian family, in which he ignores completely the class systems regulating marriage. Lowie's discussions also assume the omnipresence of the biological family as a social unit. Material from Mentawai and Aua shows that this is not completely justified. The most articulate balance has been achieved by Radcliffe-Brown, who regards the biological group, with primary emphasis upon the parent-child relationship, as the chief point of reference in any discussion of social organization but gives due weight to the importance of the more complex developments characteristic of many primitive societies. He has also made the most distinguished contribution to the hypothesis that forms of social organization develop tendencies toward particular dénouements and compromises, and that these are dictated not by the exigencies of individual

psychology but by the nature of the social forms themselves. From this point of view a class system, as in Australia, with its peculiarly artificial regulation of family composition is seen as a formal compromise between matrilineal and patrilineal forms, an interpretation which is in marked contrast to Malinowski's psychological treatment in which analogous formal compromises are viewed as the result of conflict between mother right and father love.

The family has also been regarded primarily as a status giving group, a device by which society defines the social affiliations of the members born into it. This aspect of the institutionalized family is particularly marked in systems like that of the Mentawai, where a child is formally adopted by the maternal grandfather and economically supported by the maternal uncles until the biological father, who hitherto has assumed no responsibility, upon his marriage in middle life adopts his own children and gives them their final status in the community. The family as a functioning group in the Mentawai community is often therefore actually a pair of grandparents, their sons, their daughters and their daughters' children, while many mating couples have no social existence as a family group.

The interest in forms of marriage as the clue to the historical development of the family has led to an overemphasis upon the marriage relationship and to discussions of the polygamous, polyandrous, matriarchal or patriarchal aspects of the family. The different forms of the family can be viewed somewhat more comprehensively by considering which of a series of possible relationships is made the basis for familial and social organization. These relationships are those of father to son, mother to daughter, father to children of both sexes, mother to children of both sexes and the relationship which follows from these last two at the death of the parents, brother to sister and that relationship which lays emphasis not upon kinship but upon a mere alliance of husband and wife who are members of different kin groups. All the familiar forms of primitive social organization can be derived by the elaboration of one or more of these relationships. In a strict patrilineal system, such as is found in parts of Africa, the primary emphasis is upon the relationship between a man and his male children. Wife purchase is particularly congruent in such a system, for the status of a woman is stressed neither in relation to her father nor to her husband; her primary social

function is to produce sons. In contrast to such a patrilineal system is a matrilineal system like that of the Zuni, where the important relationship is that of mother to daughter. Here women desire not male but female children; the house is owned and administered by women, the residential unit is a group of women and their more or less transitory husbands, who become even less institutionalized as members of their spouses' households than do wives under a system of wife purchase. Patrilineal and matrilineal emphasis may be combined in various ways; conditions under which an individual's status is twice defined, once in terms of the mother and differently in terms of the father, result in class systems like those of Australia and the New Hebrides. A different result obtains when the original modification is made within the family group and the relationship of one parent to children of both sexes is made the subject of formal elaboration. This is a familiar condition in Oceania, where instead of wife purchase there are exchanges validating marriage and a married woman remains an important and functioning member of her father and brother's kin group. If the system has a patrilineal emphasis, as in Tonga, Samoa and Manus, the father's sister has an important role; or if the system has a matrilineal emphasis, as in the Trobriands and in Dobu, the married man is permitted to play a more extensive social role in his sister's household, especially in regard to her children, than he could play among the Zuni. Ramifications of this system in west Africa spring from the inclusion of children of both sexes in the relationship to a parent of one sex and after the death of that parent appear as a social expression of brother and sister solidarity. Among the Dobuans the brother disciplines his sister's children, while the father of the children plays a less permanent role in their lives than in the lives of his sister's children. Conversely, among the Tongans the father's sister exercises a different type of authority in the lives of her brother's children than she does in the case of her own children.

All of these developments are in contrast with the type of family in which there is a strong emphasis upon the husband-wife relationship. Such institutions as the sororate, in which a man marries his wife's sister or sisters either before or after his wife's death, and the levirate, in which a man inherits his brother's widow, or the form of fraternal polyandry in which a group of brothers share one wife do not emphasize the conjugal relationship; they rely rather

upon the important ties within the group which make it possible to substitute one member for another primarily as a function of intrakin solidarity, whether in making good a bride price or in caring for a brother's widow. Polygamy is not so much an elaboration of the husband-wife relationship as the reflection of rank or wealth in a system which puts little emphasis upon the husband-wife relationship.

A primary stress upon the husband-wife relationship results in a bilateral kinship system and a very simple kinship structure which lacks the continuity of descent groups. Each family comes into existence from the alliance of adults who are themselves without the definite and binding ties of unilateral societies. This condition is found among many of the very simple peoples, such as the Indians of interior Canada, and paradoxically in modern industrial society. In both cases the societies have to rely upon other types of social groups for permanent form, as the family founded upon the husband-wife relationship is too unstable and discontinuous a form of organization to provide the type of firm structure which is given by social groups based upon blood relationship. It is possible to show in the case of modern society that the conjugal stress and bilateral kinship grouping has developed from more complex kinship forms based upon blood groupings. For the simplest human societies, however, there is no evidence of any such historical background and it is more correct to explain the similarity of form between such family forms and contemporary forms on the basis of a similar emphasis upon the husband-wife relationship.

As the contemporary family is often discussed from the standpoint of loss of the functions which the family discharged in earlier periods of western European history, it is worth noting that in primitive society there are also very different degrees of dependence upon the family as a focusing point of social, religious, political and economic activities. There are societies where the men take meals entirely outside the home; others in which religion is entirely socialized; others in which the economic unit is far larger than the biological family. The degree to which the family serves as the transfer point of civilization differs depending upon whether religious instruction is given by the father to the son, as among the Omaha Indians, or is made a group function with formal initiation ceremonies; whether children learn crafts from their parents or receive formal instruction from ex-

perts, as in Samoa and among the Maori. Some societies rely heavily upon the family group to dispense economic and social instruction to the children; others rely upon age groups, special ceremonies or formalized instruction. The family may comprise almost the entire social world of the child, as among some particularly nomadic groups. The biological family may be obliterated by a much larger group, so that the child is required to adjust itself to a group of some fifteen or twenty persons. Male club houses may result in boys leaving home at an early age and in the realignment of old and young along sex lines. Social institutionalizations of the old may give the grandparent generation a decisive part in the training of the young, as among the Plains Indians. Residential exclusiveness of parents and minor children, coupled with an educational convention whereby adults devote time to the care and training of young children, may result in making the child's character and temperament dependent upon that of one or both parents. In Manus, where the father plays the most important part in the life of young children, the temperament of the boys corresponds to that of the fostering male, whether he is the true or adoptive father. Under conditions of diffused family life, as in Samoa, where the child is reared as one member of a large household and is cared for not by adults but by the older children, the family plays a less determining role in the development of specific personality traits.

MARGARET MEAD

SOCIAL ASPECTS. The word family has been taken over into modern European languages from Roman law, where it denoted the community of producers and consumers formed by the largely self-sufficing household which included slaves and other servants as well as members connected by common descent or marriage. The family tends to reach beyond blood relationship, either in the form of adoption or otherwise, and to embrace more than one unit of monogamic parents and their children in the form of the so-called "large" or "joint" family. Both tendencies are rooted in social conservation, economic division and union of labor. In so far as they prevail, the boundary between the family as the narrower and the sib or clan as the wider group of blood relationship may be fixed by the external difference of living together in a household rather than in a settlement or grouping consisting of more than one household. On the other hand, the tendency toward monogamy,

even when in the form of the polygyny of one husband or the polyandry of one wife, makes strongly for the limitation of the family to the small unit of parents and children. This, the chief social nucleus of occidental Christian civilization in the Middle Ages, in modern times still resists the dissolving forces brought to bear on it by the ever increasing separation and market organization of the processes of production and consumption.

The hostility shown to the family by some modern socialists is based chiefly on its alleged character as the social and jural upholder of private property and consequently as an individualistic if not antisocial body. Its more important functions, however, are as the seat of parental authority and as the most tangible incarnation of the succession of generations. It has thus served as the most persistent factor in the education of mankind for the national community.

The nature and development of the family have deep roots in the physiological conditions of human mating, reproduction and education. The exceptional prolongation of infancy as a state of helplessness and immaturity is one of the most distinctive features of mankind generally. Through it the role of the parents as well as of other relatives in nourishing, protecting and educating offspring is of the utmost importance for the individual and for society. However fixed the inherited traits and gifts of the individual may be, the child's necessary social equipment is doubtless acquired only through a circumstantial and long continued process of artificial training and adaptation. The family has been the chief bearer and medium of this process, which also vitalizes the relations between the parents and in a wider sense between all the members of a blood relationship, for they are connected from generation to generation by the awareness of this social tradition. Parents and relatives remain together not only because the physical necessity that the female be protected and assisted under the peculiarly difficult conditions of human pregnancy, childbirth and child rearing is transformed into social customs and into laws of responsibility but also because of the mental and moral bonds arising from common propagation. The delicate structure of this complicated net of relations has often been lost sight of since modern individualism began pleading for freedom from social limitations of choice in mating and, through increasing facilitation of divorce, from legally enforced family

coherence. The continuous reemergence of concubinage as the expression of the limitation which differences in wealth and standards of living especially impose upon normal social intercourse proves that there has been no direct development away from the family.

The waning of the authoritative elements in the family is very probable in the light of economic changes which have occurred since the advent of capitalistic society. Production for the market instead of for the household tends to remove the center of production outside the family—from the artisan's workshop to the factory, from a desk in the home to an office. The far more persistent union of living and working among farming populations leads the family to play a different role in rural society. Capitalistic economy, furthermore, is not satisfied with the productive services of merely the father or some other leading and responsible member of the household; it attracts the labor of all adults and in many cases of the children. In Soviet Russia the creation of the five-day working week, as a result of which different family members often have a different rotation of workdays and holidays, is undermining the family in a manner comparable with that of industrialization in all modern civilized countries. The social and economic changes of modern society are likewise militating against the practise of domestic cooking as well as the family ritual of joint meals connected with it. German "house music" and the pastimes of the English drawing room are giving way more and more to amusements outside the home that unite each generation instead of the family. Although there have always been powerful community centers competing with the family, from the men's clubs of primitive societies down to the political and social clubs and coffeehouses of modern Europe, it is not until recently that leisure time activities as well as work have been quite generally transferred from the family to the larger social units. Civic or community centers in the United States appear to typify this transition.

Changes in the family have been accelerated by movements growing out of modern individualism and socialism. Feminism is one of them; social work as a concept comprehensive of all action for social reform is another. The program of the female emancipation movement of the nineteenth century was directed only against the dominance of men in society at large and especially in the family. The movement, however, while it improved the status of wives

and mothers and especially of the spinster, who had had a very precarious place in the family, could not but generate criticism, aloofness and hostility toward the traditional family. In these respects it was assisted by the extension of the slogan of emancipation to include the position of children in the family, through such books as Ellen Key's *The Century of the Child* (1900). The revolt of children against the old time family became particularly insistent as the acceleration of social change before, during and after the World War united the younger generations against the authority and standards of the older generations in the consciousness and organization of youth movements, which are especially prominent in Germany.

The emancipation of women and the manifold objectives of child welfare work will put the modern family to a definite trial. The more rational and specialized methods of education for societies that have an ever growing division of labor were very early taken over from the family by the modern state and its subordinate corporations. This applied at first primarily to the upper rather than the lower classes of society, but with the advent of the industrial communities public action was evoked by the neglect, distress and delinquency of the children of the lower classes. The real force of neo-Malthusianism lies not in the rationalistic individualism of birth control which is provoking resistance on the part of churches and governments, but in its challenge to these institutions to provide economic and cultural living room for the passing prolific family. The system of social welfare promotion with its subdivisions of public education, sanitation, housing, relief and recreation hems in and detracts from the social status and authority of the family. But there are indications that as the older and more revolutionary ideas of emancipation from the family and of substitutes for it are followed and partly replaced by intensive efforts to combat its modern diseases and degenerations, its natural foundations and positive beneficent influences will more clearly reemerge. Such indications come in the shape of reactions of the working classes. The superiority of their family spirit over that of a large part of the so-called higher classes does not appear to be a mere residuum of an older social order, but rather a persistent habit of comradeship and cooperation which is fundamental for the modern labor movement. There is also evidence that in Soviet Russia the original government policy of eradicating the family is

yielding to the resistance of the rising generation.

Revolutionary socialism believed the family to have developed out of sexual promiscuity and economic communism. In reality the family as the last stronghold of the precapitalistic self-sufficient and patriarchal household offered a model to communism, just as the family was the pattern on which such forms of common life as the monasticism of the churches and the brotherhood of the sects were molded. At present the European-American family is vigorous not only in the Roman Catholic world, where the sacrament of holy orders is the counterpoise of the sacrament of matrimony, but also in the Protestant denominations, where the family life of the clergy has been intended to set a standard for the rest of the community. Even in Islamic and Buddhistic countries recent economic changes have frequently led from polygyny to monogamy. A conservative attitude with reference to the family is only partly due to the power of political and ecclesiastical domination and consequently its doom was not pronounced by the transference of marriage and divorce from clerical to secular jurisdiction. Modern French jurisprudence, even since the restoration of divorce in 1884 (it had been abolished in 1816), recognizes the family as an institution instead of as a mere contract relationship. In spite of the disintegrating forces operating in capitalist economy and mentality, counterforces toward family coherence assist the common household; for example, the voluntary labor and pecuniary contributions of grown up children. In Europe during and after the World War the voluntary relief of relatives alleviated at least partially the economic distress and dismemberment of the middle classes who were suffering under the burden of inflation and taxation.

Some of the earlier programs of social reform relating to the family appear not to be applicable to present day conditions. Contemporaneous with the development of lucrative female occupations the fight of the feminists for the limitation of the husband's lordship and guardianship in the family is being extended to prevent the husband's appropriation of current earnings, which, whether a regime of separate marital property exists or not, often takes place. Adoption, which formerly functioned chiefly as a means of legitimizing children and of equalizing the burden of education between different social classes, is now frequently being commercialized as an instrument for the acquisition of titles or other social good will. Marital status and the

number of children in the family, formerly private and individual responsibilities, are now made the subjects of elaborate government policies, especially in countries with a declining birth rate. Prizes and tax reductions are awarded to encourage childbearing; special taxes are often levied on celibates. Public and private policies of salary and wage fixing are now also partly determined by family status; family bonuses are offered. Prostitution, which has been regarded not without reason as a social by-product of strict family regulation, can no longer be interpreted merely as another obvious form of exploitation of the lower classes by the higher, for it has cropped up in the very midst of the degenerate plutocracy of the capitalistic countries. Illegitimacy, which was regarded as the most unjust, if unavoidable, corollary of the legal family, appears to be on the decline in Germany, although legislation has been passed to soften its disadvantages.

FAMILY ALLOWANCES. The system under which the workers' wages are supplemented by sums proportional to the size of the family is known as the family allowance system. Such a system may replace or modify the system of wage remuneration according to output by the principle of remuneration according to need.

The supplementary payments may be made voluntarily by employers as individuals or in groups, compulsorily as contributions to state systems or by the state itself entirely out of its revenues. Of the systems operating at present in more than twenty countries and affecting over ten million workers those of continental Europe covering workers in private industry are mainly voluntary employers' schemes, with state

paid allowances applying only to public employees.

The supplementary payment may be regarded by the worker as an integral part of his wages and therefore due to him as his right; this view is usually expressed in collective agreements embodying family allowance systems such as exist in Germany. These payments may, on the other hand, be considered as the right of the parent, particularly the mother in return for her services to the state in bringing up her children, in which case the payment should be made directly by the state. Although the assumption by the state of the obligation thus to supplement wages involves a comparatively new and extremely controversial principle, the state has in other and various forms assisted in the economic burden of maintaining a family. A tax on bachelors and graduation of taxation according to the number of the taxpayers' dependents are negative forms; a positive form is the encouragement of larger families by bounties in countries such as France, where decline in population is viewed with concern; other public benefits in money or in kind are mothers' pensions, additional social insurance benefits based on the number of dependents, free education, housing subsidies and the like.

The allowance may be regarded not as a right of the worker and an obligation of the employer but as an act of Christian social justice; this motive has somewhat influenced the introduction of the scheme in countries influenced by the Catholic social doctrines. Or the employer may regard the payment of the allowance as a gift on his part and use it without consulting the workers as a form of welfare activity to reduce turnover.

On the whole, the family allowance system is a post-war method of wage remuneration in industrial establishments. Isolated instances on a small scale existed in the factories of social Catholic employers in France prior to 1914. In agriculture supplementary allowances in kind are a common practise of long standing in many countries. The extensive application of the system in industry developed from the practise of meeting the wartime rise in prices by supplementing wages with cost of living bonuses varying in amount according to family needs. This mitigated the worst effects of the fall in real wages during the period of inflation without any admission of the necessity for adjusting basic wages. Subsequently to stabilization, how-

ever, the practise declined in importance in private industry.

By 1921 in the Scandinavian countries and in Switzerland it was almost entirely abandoned by private industry but was continued in some of the public services. In the central European countries of Czechoslovakia, Austria, Poland and Germany, even though currency stabilization was followed by a pronounced decline in the extent of application of the system, it was continued by collective trade agreements in various industries, particularly coal mining and metal trades and for clerical workers in commerce and banking. By 1929 family allowance clauses were included in collective agreements covering about 3,000,000 workers in private industry in Germany. In all of these countries and in Italy, Holland, Latvia, Estonia, Hungary and several other countries the system is in effect for all or some of the persons employed in the public services. In France and Belgium it developed steadily during the decade after the war. In France in 1930 approximately 4,260,000 persons in private industry and public services, central and local, were employed in enterprises which paid family allowances. In Belgium the corresponding number for 1929 was over 800,000. In both these countries legislation requires employers engaged on state contracts to pay family allowances.

An important post-war application of the system has been in Australia and in New Zealand; in New South Wales particularly it developed out of the difficulties arising in compulsory arbitration over the definition of a living wage and in distinguishing between the wages paid to women, to unmarried men and to married workers. Women's wages were influenced by the fact that here as elsewhere women were considered to be without dependents. Moreover, there was considerable controversy over the size of the "average family." In Australia allowances paid directly out of state revenues had been made to the lower paid grade of federal officials since 1920. In New Zealand under the act of 1926 allowances are paid for each child under fifteen years from the third child onward in families of small incomes; in 1928-29 there were 3763 families benefiting and allowances totaled over £54,000. New South Wales introduced a system in 1927 based on a tax on employers; in 1929 the scope of the system was extended, and in 1930 the tax was reduced to 1 percent of the annual wage bill. Extension of the system to all states of the com-

monwealth with coordination between the basic wage and the allowances has been a burning question for several years, but after a detailed investigation a majority report of the Royal Commission early in 1929 recommended against its general compulsory adoption.

Since the advocates of the family allowance urge it as a method of redistributing the amount available for wages according to need, thus eliminating the poverty which is serious among workers with large families and low earnings under a system of uniform wages, it is relevant to raise the question of what effect the system has—first, on the total wage bill; second, on the actual allowances paid to the married workers; and third, on the possibility of discrimination against the worker with a family.

The payment of the allowances may involve an increase in the wage bill or perhaps merely a redistribution so that those with large families receive a greater proportion, or it may be so introduced that the total wage bill is reduced. The effect of the introduction is closely related to the sponsorship and administration of the system. When the system was adopted during periods of severe inflation in certain European countries, there was an actual reduction of the total wage bill, which gave the employers a competitive advantage over their rivals who increased the wages of all their workers. Workers with large families received allowances which compensated for the increase in the cost of living, but those with few dependents lagged behind and consequently the total real income of the workers was reduced. This is less likely to occur in more normal times, especially if the fixing of scales and allowances is part of a system of negotiation between trade unions and employers or where the allowances are paid by the state. Recently in New South Wales, where the state fund is created by compulsory employers' contributions, there has been acute controversy as to whether the adoption of the system should be accompanied by a reduction of the basic wage of all workers.

On the whole, the amounts of allowances, the scales of which differ both in type and amount, have rarely been adequate for the full maintenance of the children for whom they have been paid. In France and Belgium they are usually paid only for children but, mainly because of the definite purpose of increasing the birth rate, on an ascending scale, i.e. with a larger amount for each succeeding child. Descending scales are rare. Sometimes allow-

ances are paid only for children after the second or third; less frequently they are paid for the first two, three or four children but not for succeeding children. Often, especially in France, the allowance for families with two or three children represents an addition of 4 to 10 per cent to the worker's wage. For some grades of public servants and banking officials, especially in Germany, the addition to the wage or salary is considerably higher, sometimes as much as 20 to 30 per cent.

To meet the problem of discrimination in favor of the worker with few or no children equalization funds have been established in France and Belgium. These are funds for the payment of allowances established by employers of a given industry or district into which each employer pays at regular intervals amounts based on some criterion other than the number of the children of his employees, the most usual criteria being the total wage bill and the total number of workers. In 1930 there were in France 232 funds covering 1,820,000 employees. In Belgium in 1929 there were 40 funds covering 600,000 workers. The equalization fund system has also been tried in one or two other countries, particularly in Holland.

The question of the effect of family allowances on the birth rate is highly controversial. The fact that it is introduced in some countries as a definite incentive to that end and the belief that the allowance system of the poor law relief of the nineteenth century resulted in an increase have led to opposition in those countries already sufficiently populated. French and Belgian statistics seem to show some tendency toward an increase in the birth rate among families receiving allowances and a definite diminution in child mortality among families covered by equalization funds, probably as a result of the advice of doctors and visiting nurses, for which many funds provide. But this effect will vary not only with the size of allowances and the kind of scale but with the extent to which family limitation is a conscious policy.

When the system was first introduced into private industry in France and Belgium it was strongly opposed by the socialist unions, who considered it a means of withholding increases in wages which should have accompanied the rise in prices. There was also the fear of dividing the interests of the workers. But as the system spread, the unions found it difficult to prevent its acceptance by the rank and file. Neverthe-

less, they demanded instead a compulsory state system to be paid out of revenues or from joint contributions of employers and the state. Attempts to make the payment of allowances compulsory for industry in France have been unsuccessful. Similarly, in various central European countries the socialist unions oppose allowances on a private basis; the Christian unions, however, are not hostile to the system.

In Great Britain, where the subject is a matter of considerable interest, most of the proposals are for the introduction of such a system by the state. Although generally the British trade unions seem to prefer other methods of compensating for inequalities in wage remuneration, the family endowment scheme has considerable support among the group interested in the application of the principle of equal pay for equal work between men and women. Those proponents of the scheme who consider the matter one primarily of community interest suggest payment out of state revenues. Joint contributions of employers, workers and the state are also proposed to create a form of social insurance against need, although the applicability of the term insurance is a matter of doubt. There has been evidenced even less public interest in the family allowance system in Canada and the United States, where neither trade unions nor employers have espoused the system.

FAMILY BUDGETS. Interest in family budgets had its beginning in England at the close of the eighteenth century and followed the industrial revolution across the channel to the continent. Beginning as a study of poverty and social distress, with an immediate aim of modifying or justifying existing poor laws, schemes of taxation and the like, it gradually became wider and more objective, especially after the development of the science of index numbers, sought to include more social classes and today tries to make itself a tool of general social investigation.

The first attempts were rudimentary. Thus Arthur Young (*Farmer's Letters*, London 1767, 3rd ed., 2 vols., 1771, especially Letter v), intent upon showing that the wages of the agricultural laborer actually permitted a surplus over subsistence needs, drew up a budget based upon "the actual outgoings" of four families. On the other hand, the rector of Barkham, David Davies, collected a number of actual budgets from his own and other parishes to prove that wages were insufficient and that "it is but little that . . . the belly can spare for the back" (*The Case of Labourers in Husbandry*, London 1795). Sir Frederick Eden, anxious to prove in the years of distress which attended the high price of corn that increases in the poor rate were not necessary, gathered his returns on a large scale and with the beginnings of a scientific technique. He collected more than one hundred estimated budgets from many English counties, sending about at his own expense "a remarkably faithful and intelligent person" to obtain the "exact information" according to a schedule. Eden's schedule in addition to a great deal of miscellaneous information called for the "usual diet of labourers" and "earnings and expenses of the labourer's family for a year: distinguishing the number and ages of the family and the price and quantity of the articles of consumption."

The most significant pioneer contribution, however, and one which influenced many subsequent budget studies both extensive and intensive, was that made by the French engineer Le Play, who after twenty years' study of individual working class families scattered over many European countries published the budgets of thirty-six of them in his monumental *Les ouvriers européens* (Paris 1855). Le Play carefully selected his families after consultation with local clerical,

educational and other authorities so that they might be "typical" and then lived with each himself for months at a time. He wished to discover what were the conditions that made for the *famille souche* and what were some of the factors in its disintegration. Hence his limitation to a purely monographic method and his emphasis upon the whole configuration of each family's economic life—its treasured possessions quite as much as its income, its working habits and the collaboration of the members with one another as well as their physical consumption. He believed that every act of a family's life can be expressed in an income or an outgo, and each item of his budgets was most carefully computed as to quantity and price. In the second edition of his work (6 vols., Paris 1877-79) Le Play added twenty-one additional budgets. In the meanwhile the Société Internationale des Études Pratiques d'Économie, founded by him in 1856, pursued similar studies, publishing family monographs periodically and serving as the center for European students who later carried on the work begun by Le Play. In 1890 appeared the "Budgets comparées de cent monographies de familles" (in Institut Internationale de Statistique, *Bulletin*, vol. v, 1890, p. 1-157), in which two of his disciples attempted to treat comparatively a hundred of the highly diverse budgets amassed by Le Play and his school.

Meanwhile the first of the extensive governmental budget studies, instigated by admirers of Eden, had been begun on the continent. Following the years of distress, 1850 and 1851, the Belgian central statistical bureau, of which Quételet was a member, hastily improvised a study for the consideration of the first international statistical congress held in 1853, for which it secured the auspices of the government and the direction of Édouard Ducpétiaux, whose report appeared in the same year as did Le Play's work (*Budgets économiques des classes ouvrières*, Brussels 1855). In order to make its data comparable, the bureau had sought what it considered the typical family—a man, wife and four children, two wage earning, aged sixteen and twelve, and two dependent, aged six and two. Its schedules, distributed through the medium of local statistical bureaus, attempted to distinguish between "material necessities," "cultural goods" and "luxuries and waste" and required quantity as well as cost estimates. It demanded that in each locality families be selected at three economic levels: the dependent, the barely self-supporting and those with a little saving. Over a thousand

schedules were returned but only 199 later proved usable. Ducpétiaux' study was thus decidedly limited. Moreover, he himself gave his results in francs only, content to show how much poorer was the Belgian worker's standard than that of the soldier, sailor or even prisoner.

It remained for the German statistician Ernst Engel, a disciple of Quételet and originally of Le Play, to evolve a statistical basis which would render comparable budget studies made at different times and places, despite variations in the composition of the family in age, sex and number. In 1857 he had reduced 199 of Ducpétiaux' budgets and thirty-six of Le Play's to a percentage and per capita basis. From his results, which he confirmed by later investigations, he deduced the law of consumption which bears his name: the greater the income per family, the smaller the proportion spent on bare subsistence necessities; or, stated somewhat more fully, as the family income increases, a smaller percentage is spent on food and the expenditure for clothing remains approximately the same, as does the percentage for rent, fuel and light, whereas a constantly increasing percentage is expended for education, health and other "cultural" items. At this time he was content to differentiate between children and adults, as Ducpétiaux and others had done before him, by merely calling a child equivalent to half an adult. Somewhat later as chief of the Prussian statistical bureau interested in calculating the incidence of Bismarck's social insurance program Engel sought a more exact scale of measurement. In *Der Werth des Menschen* (Berlin 1883) he drew up a scale for measuring family composition in terms of consumption units, *Gliedeinheiten*, in which he took as his unit (later named the "quet" in honor of Quételet) the hypothetical costs of the child at birth and on the basis of Quételet's height-weight tables increased these costs by annual increments of 0.1 up to the age of twenty for women and twenty-five for men, at which times they rank at 3.0 and 3.5 respectively. This quet scale, which he employed in further studies, is still widely used on the continent (as in the Swiss survey of 1912, the Hungarian of 1917 and the Belgian of 1921). Engel believed in combining with the extensive method the technique of the carefully supervised account book (see *Das Rechnungsbuch der Hausfrau*, Berlin 1882). The most successful continental surveys of later years have followed this plan.

Equipped with the tools of comparison provided by Engel, European governmental statis-

tical bureaus undertook a number of extensive budget surveys in the eighties and nineties, most of which were, however, rather perfunctory. An outstanding exception was the study undertaken by the Danish governmental statistician Marcus Rubin in 1897. Unofficial investigators, on the other hand, confined themselves for the most part to limited monographic studies in the Le Play manner. In Germany especially the gathering of individual household accounts went on apace. The leaders of the movement were Gottlieb Schnapper-Arndt of Germany and Carl Landolt of Switzerland.

In the United States unusually extensive government surveys were begun at an early date (1874-75) by Carroll D. Wright, then head of the Massachusetts Bureau of Statistics of Labor. Later as federal commissioner of labor in his annual report for 1891 Wright, who was apparently ignorant of the quiet scale, developed one of his own, avowedly arbitrary, to represent both food and general consumption at different ages. In the surveys made by the United States Bureau of Labor in 1890, 1891 and 1901 Wright emphasized, as had Ducpétiaux, the "normal" family, but he reduced it to an average of three children (one to five allowed), none of them wage earning. These surveys, the last of which covered more than 25,000 families, over 11,000 of which were "normal," were all carried on by field agents using the single interview method.

Early in the twentieth century a number of useful studies of the poverty line and above were undertaken by various non-governmental agencies in England and America. Outstanding among these was the work of B. S. Rowntree of England, who, beginning with his survey of York (*Poverty, A Study of Town Life*, London 1901) sought to follow out and deepen the lines laid down by Booth (*Labour and Life of the People*, 3 vols., London 1889-91) a decade earlier. Whereas Booth in the first volume of his survey had incidentally used some budget material of an outline sort, Rowntree stressed it and began a system, continued in his subsequent publications, of introducing detailed actual as over against standard budgets, carefully gathered by field agents, in the body of his work. In the United States Mrs. L. B. More working through the medium of a settlement house made a survey of the Greenwich section of New York, covering some 200 families, by supervised schedules, which were supplemented by a number of more or less successful actual household accounts kept for brief periods by families (*Wage-*

earners' Budgets, New York 1907). Although her survey was in the main extensive, Mrs. More attempted some approach to the monographic method of Le Play through the oft repeated visits of charity visitors, nurses, teachers, clergy, etc. for the period of a year or more. Comparing her work with previous American studies Mrs. More showed some modifications of Engel's law. An even more valuable study was that made by R. C. Chapin for the Russell Sage Foundation of New York (*The Standard of Living among Workingmen's Families in New York City*, New York 1909). Chapin placed more reliance upon the single interview, but combined it with an unusually full and well organized schedule and worked up his material in excellent comparative form.

Later American studies of living standards have added further refinements of computation. An unusually accurate study was that undertaken by the Philadelphia Bureau of Municipal Research under the direction of William C. Beyer (*Workingmen's Standard of Living in Philadelphia*, New York 1919) in the midst of the wartime rise of prices. It not only successfully combined the agent schedule method with the check up furnished by supervised account books, but it succeeded in separating out the quantitatively expressible material in its returns in the simplest form for future recalculation. In its final quantity cost standard budget this "specified" portion amounted to four fifths of the total expenditure. The remaining "unspecified" fifth was then assumed to vary in price in the same proportion as the specified.

In Europe today budget study has progressed furthest in Germany, Belgium, Holland and the Scandinavian countries. With the one outstanding exception of the study by the Institut Solvay in Belgium (Slosse, A., and Waxweiler, E., *Enquête sur l'alimentation de 1065 ouvriers belges*, Brussels 1910) the surveys have all been undertaken by national or municipal authorities. In all of them actual family accounts were secured, running for from two weeks to two years and carefully supervised; in many cases the studies included under separate classification lower middle class groups as well as wage earners.

Outstanding among this continental group have been the German studies of 1907-08 and 1927-28. They not only covered an unusually large number of cases with a high degree of accuracy by the long time account book method, but they included two significant groups, public officials and salaried employees (the earlier study

included school teachers), and gave their results in comparative tables arranged carefully for each group by size of family as well as by income class. In England, on the other hand, the method of collecting returns appears to have been relatively casual. The British Board of Trade even in its extensive 1904 and 1918 surveys depended largely upon unsupervised answers to questionnaires, which were distributed by friendly societies, secretaries of trade unions and the like. In Ireland the distribution was by school teachers and in Australia apparently largely by mail; as a result only a small proportion of the returns were usable.

The period of the World War brought about an extensive movement for budget surveys in all the leading countries to establish cost of living indices, followed in the immediate post-war period by a widespread move to resurvey (see *COST OF LIVING*). Not only England and the continent, the United States and Canada, Australia and New Zealand (where budgets of one sort or another had long been used for wage arbitration), but Japan, India and the Dutch East Indies began to publish budget data. The 1918-19 survey by the United States Bureau of Labor Statistics of over 12,000 families was especially valuable. The schedules were greatly elaborated, handled by experienced agents and checked to within 5 percent accuracy or else discarded. The survey, however, continued to concentrate upon one class only, the "typical" industrial workers in each selected community. Middle class and rural families were not touched. Indeed the only noteworthy attempt so far in America to deal with middle class budgets inductively has been by certain private groups in university centers, which have undertaken small scale studies of professors' expenditures. Other lesser studies by the bureau and by private agencies, especially by trade unions, have dealt with special occupational groups. Special surveys for health purposes have also been undertaken. An extremely exact as well as extensive study was that made by the United States Public Health Service in 1916-17 in seven South Carolina mill villages; it covered 4000 persons and had as its point of departure the question of the relation of income to pellagra incidence (United States, Treasury Department, *Public Health Reports*, vol. xxxv, pt. ii, 1920, p. 2829-46).

One of the latest steps in American post-war development has been the beginning of the study of farm family budgets. Intensive study of farm families had long ago been developed by zemstvo

statisticians in Russia as a means of casting light on the condition of the liberated peasantry (see especially the work of F. A. Shcherbina, *Krestianskie budjeti*, St. Petersburg 1900); and various continental countries had made extensive surveys. In the United States, however, it was not until 1922 that the Department of Agriculture in conjunction with a number of land grant colleges, particularly Minnesota and Iowa, began to make a series of farm budget studies, highly suggestive although of an uneven statistical value (see Kirkpatrick, E. L., *The Farmer's Standard of Living*, New York 1929). Agricultural county agents were used to supplement the work of the special budget personnel. Most of the studies divided the families according to their property status, as owners, tenants or share croppers, but in a survey of Virginia urban and farm communities the division was kept on a purely income basis for the sake of comparability.

The accounting side of farm budget study presents special problems. Here the family is both producer and consumer, and the budget gatherer has not only to disentangle net income from production costs but to allocate to the latter a proportion of what would ordinarily be accounted household expenditure (e.g. the telephone, the automobile). On the other hand, home grown food although in large part a by-product of production for the market takes the place of retail purchases that would otherwise have to be made and so is usually assessed at its retail purchase price. Some experimental work has been done in the farm surveys to estimate the relative value of the agent schedule as over against the account book method. Here as elsewhere in American experience the weight of evidence is in favor of the interview method when properly applied. Short time supervised accounts can then be used as a check up. The correct technique in the case of farm families of course requires an interview with the farm operator as well as with the housewife. The schedule must be extremely detailed.

In attempting to set up "standard" budgets for any group the statistician is confronted by this dilemma: shall he simply portray "average" existing conditions, or shall he cut loose from those moorings here and there to portray conditions as he would have them—e.g. such as would be required for good health? Usually the result is a compromise with its direction determined by the purpose for which the budget is drawn. Thus during the war, with labor greatly

in demand and the government pledged to preserve industrial peace, the content of American standards was distinctly scaled up. Standards originally considered "subsistence plus" were now accounted merely "subsistence," while below them came "poverty" and above, "health and decency" and even "comfort"—the last a conception new to the cost of living world. Government agencies actually drew ideal budgets adjusted to these levels (*see STANDARDS OF LIVING*).

A constantly recurring problem in budget study is that of devising the best unit of measurement of individual consumption by sex and age. Engel's quet scale was abandoned in Germany as long ago as the 1907-08 study, for it was considered, when applied to items other than foods, to run too high for children. An arbitrary scale of sharper inclination was therefore chosen to combine the hypothetical effects of food and other costs. In the 1927-28 study this was in turn abandoned in favor of two separate scales—a food scale and another, far lower one for other items. In the United States the even more arbitrary Wright scale continued to be used by the Bureau of Labor Statistics for general purposes, although for food requirements it had early been replaced here as in England by the Atwater scale. The latter, drawn up in 1895 by W. O. Atwater, was based on the number of calories found to be required at different periods of physical development and under varying requirements of muscular activity in varying types of occupation. Still another, simpler scale of food requirements was that devised by Professor Lusk of Cornell in 1907, adopted by the Inter-Allied Scientific Food Commission and used in the British family budget inquiry of 1918, the Egyptian inquiry of 1920 and the Bombay inquiries of 1921-22. All these later scales take the adult male as the unit of consumption.

The use of different requirement scales naturally produces widely varying results. Thus the investigation of the Agricultural Wages Board in Great Britain in 1919 disclosed that its "standard" family of five contained 3.8 units when calculated according to a modified Atwater scale and 4.4 units under the scale of the Inter-Allied Relief Commission. A more recent attempt to improve on these scales of food requirements is that devised by Edith Hawley ("Dietary Scales and Standards for Measuring a Family's Nutritive Needs," United States, Department of Agriculture, *Technical Bulletin*, no. 8, 1927).

In the realm of expenditures other than food the one outstanding scale arrived at inductively is that of Sydenstricker and King, devised in the course of the United States Public Health Service study in 1916-17. Seeking to classify the population of cotton mill villages by per capita income—the only significant standard for health purposes—and having to take all the population as it came they first built up a food expenditure scale in adult male units. This so-called "ammain" scale differed slightly from the Atwater scale, particularly in the case of aged persons. They then segregated the major items of individual expenditure other than food—clothing, education, amusements, health, etc.—by sex and age of the individuals and found this scale to run far lower for women, children and the aged than the corresponding food scale. Finally, combining the two, they secured a general "adult male maintenance," or "ammain," scale that still fell off far more sharply than the Atwater for age and sex. In less poverty stricken communities these differences, particularly in regard to women, would certainly prove less marked.

Once a series of satisfactory scales for successive income levels has been built up, it should prove possible to leave behind the restricted field of the "normal" family and to test out the expenditures of actual family groups as they occur in the general population—young wage earners and aged dependents included. Moreover, it should be possible to trace out inductively what Engel and Rowntree long ago suggested, the moving costs of a family from the birth to the death of its members.

FAMILY DESERTION AND NON-SUPPORT. Family desertion as a problem of the court and of the social agency is generally accepted to mean desertion by a husband of his wife or by a father of his children in cases in which the question of support arises. The two aspects are always linked together, so that cases of non-support under separation or divorce agreements or decisions which do not involve desertion are rarely included in the term. On the other hand, desertion by the wife or mother or even desertion of aged parents is excluded because of the absence of the element of support. In most countries there is a distinction between the rights of legitimate and illegitimate children to support, and family desertion usually covers only the former.

In so far as it becomes known to courts of domestic relations and social agencies family

desertion is largely a phenomenon found among the low income groups, not necessarily because desertion as such is mainly due to economic pressure, but more probably because men in this group choose the informal freedom of desertion rather than the more conclusive and expensive methods of formal separation or divorce when family discord has reached the breaking point. The extent to which such desertion finally culminates in legal separation or divorce varies according to a number of factors, among them the provisions in the various states regarding desertion as a cause.

There is little accurate information as to the extent of desertion in the entire population. Many deserted wives do not resort to the courts or to charitable agencies and those who do frequently conceal their true state by calling themselves widows. On the other hand, the statistics of desertion and non-support of wives as a basis for divorce are no accurate index, as this allegation may be a convenient cloak for other reasons.

Several studies have been made of all aspects of desertion in the United States by the agencies which over long periods found that the burden of caring for deserted families formed a considerable percentage of their entire task. Early attempts to study the causes of desertion are numerous and there exist elaborate tables which attempt to fix the preponderance of one cause or another. In later years such attempts were abandoned. In their stead were listed the causal factors found or explanations of desertion given by the clients themselves, and with the more searching study of the family as a social institution desertion has been recognized as only one of the possible results of behavior patterns which relate to the much wider problem of family discord and disorganization.

From these studies it is safe to say, however, that desertion, like other manifestations of family disorganization which come to public attention, is preponderantly a problem of the city. This seems true as well of countries other than the United States. Desertion increases with the increased mobility of the head of the family as a wage earner. Although it is not markedly affected by racial origins or by religious affiliations, in this as in other types of family discord "mixed marriages" in either of these particulars have been shown to yield a high rate of desertion and divorce. In one study recently made in Boston it was disclosed that contrary to the popular impression the native born population

Family Budgets — Family Desertion and Non-Support 79

formed the largest single group of disorganized families; these figures do not, however, indicate the race of the native born group. In the immigrant group desertions are probably high in comparison to the rate of desertion in the "old country"; the quicker adjustment of the husband to certain American manners and standards is often a cause for discord, while, on the other hand, American standards of feminine freedom are slow to be accepted by immigrant husbands. Families left behind in the "old country" are frequently deserted, and this causes special legal and social difficulties.

Conclusions as to the effect of economic factors must be similarly qualified. For instance, while it is true that the cases which come to the attention of the court and social agency fall in low income groups, a positive correlation between desertion and periods of economic depression is hard to establish and the figures of the (Jewish) National Desertion Bureau show that in neither 1914 nor 1921 was there an unusual increase in new cases. The period of depression did bring additional applications for relief from self-supporting deserted wives who had previously needed no assistance, but, on the other hand, in several instances, particularly where adultery had been the cause of desertion, unemployment and hard times caused a return of the husband to the home.

More positive statements can be made of financial and social costs to the community which result from desertion. The studies made show a surprising uniformity in the ratio of deserted families to the entire load of dependent families carried by family welfare agencies. Figures presented by E. E. Eubank in *A Study of Family Desertion* (Chicago 1916) show that up to that year they formed about 10 percent of the burden. According to the more recent Boston study, covering the period from 1918 to 1928, the load still remains fairly constant. The latest attempt to estimate the financial cost of desertion to the social agencies of a city was made in Cleveland in 1929, when a careful statistical study was made of all deserted families coming under the care of social and health agencies, courts and institutions during a six-month period. The total cost of assistance rendered, including direct relief, cost of service and institutional care for 533 families, was estimated at \$158,000 annually.

Of greater significance is the relation between non-support or desertion and juvenile delinquency. Of a group of 1323 Philadelphia fam-

ilies dealt with in non-support or desertion cases involving children between the ages of ten and twenty 230, or 17 percent, had one or more children known to the municipal court at some time because of delinquency or crime. Of a group of 284 families with children to which divorces were granted in Philadelphia during a period in 1923 and 1924 selected for study 13 percent were known to the municipal court almost entirely through its domestic relations division during the year in which applications for divorce were filed; and 47 percent had been known in that year or previously.

Figures obtained by the United States Children's Bureau showed that of 5286 families dealt with in Cincinnati in 1923 by the courts and by the Ohio Humane Society (with or without court action in the municipal or other court) covering cases of desertion, divorce, non-support and delinquency 13 percent involved more than one of these types of case during the year. Among the children's cases dependency and neglect were most likely to occur in combination with other types of case; 41 percent of the families known in dependency or neglect cases were known also in cases of other types, usually non-support or desertion or divorce; 28 percent of the families dealt with in cases of non-support or desertion were dealt with in cases of other types also—for the most part children's cases or divorce cases; and 26 percent of the families dealt with in divorce actions were known in cases of other types, chiefly non-support or desertion.

Juvenile court statistics compiled by the Children's Bureau for children dealt with in dependency and neglect cases by fifty-three courts during 1928 show that only 28 percent of the children were living with their two legitimate parents. Not only the lack of proper support and care but the failure of parental companionship and guidance, the shocks of family discord, the fear induced by abandonment, are here apparent.

The various family welfare agencies interested in the problem in the United States have devoted considerable attention to its remedial aspects as well as to the matter of immediate monetary relief. As a result of their efforts considerable progress has been made in improving the laws on desertion and non-support. Probably because it represented a startling departure from previously maintained family standards in their group and because of the complexities involved in desertion among immigrants the Jewish social agencies were among

the first to institute studies of the problem. As a result of persistent study and agitation by the National Conference of Jewish Charities the National Desertion Bureau was established in 1919. It has prosecuted vigorously the work of locating and apprehending deserters, preventing fraudulent actions for divorce and representing in this country the interest of Jewish wives and children abandoned in Europe. It handles about 2500 cases annually. William H. Baldwin, a member of the Board of Managers of the Washington, D. C., Associated Charities, between 1905 and 1921 published a number of pamphlets dealing with various phases of non-support law, particularly with the injustices and inequalities in the interstate and international extradition laws and treaties and with the desirability of making allowances for the support of the wives and children of men imprisoned for non-support.

The common law recognizes only the civil right of tradesmen to recover from the husband debts contracted by the wife for reasonable living expenses and does not recognize a right by the wife to sue her husband for failure to support her and her children. The statutes of the several states do recognize this right but appear with some exceptions to be based on the premise that the abandoned wife and children are "likely to become public charges," although in no case is it demanded that they shall have become such before suit for support can be started.

Nevertheless, there is still a great variance in the laws of the various states as to the degree of criminality involved in desertion or non-support and even more variability in their administration. In 1910 the Commissioners on Uniform State Laws developed and recommended for adoption by the several states a Uniform Desertion and Non-Support Law. This has been adopted in part by several states, but its terms are necessarily quite general and it does not make a clear pronouncement on several troublesome points; for instance, whether desertion should be classed as a misdemeanor or a felony.

The decision whether a man shall be prosecuted for non-support, which is usually classed as a misdemeanor, or for child abandonment, which is usually a felony, may rest on the extraneous consideration of whether he has or has not left the jurisdiction of the state. Although the offense would seem of equal magnitude in either case, in order to obtain his extradition

it may be necessary to proceed on the more serious charge.

Other discrepancies are found in many states on such questions as the length of time that must elapse before the wife may take out a warrant, the right of a childless wife to sue for support, the status of the pregnant wife and the child *in utero* as to support. There is great variance among the states in their willingness to extradite for desertion and much confusion as to whether the wife may sue in the state where she happens to be, in the state where her husband is or in the state where the desertion took place, if these happen to be different. In some states no satisfactory court decision has ever been rendered as to whether desertion is or is not a "continuing offense"; that is, whether a man who has been arrested and has served a sentence for abandonment can be rearrested after release if he persists in failure to support.

There is also wide variation in the legal treatment of cases of desertion and in the kind of courts to which they are assigned. The ordinary procedure, when court action is to be resorted to, is for the wife to make the complaint. In some states a social agency which has assisted her is allowed to enter the complaint. States which permit mothers' pensions to be paid to deserted wives usually insist that the wife appear as complainant as a prior condition to granting the allowance. If the husband is in the city he is summoned to appear; a warrant for his arrest is not usually issued unless he fails to answer summons or has left the jurisdiction. If his whereabouts are not precisely known, most enforcement officers will customarily take no steps toward his apprehension, placing upon the woman or the social agencies interested in her the task of locating him before steps are taken for his arrest. There is often further official inertia to be overcome on the ground that it will cost the state too much to send for him, or that if convicted and sentenced he will be of no more use to his family than if he remains at large. This argument is of less avail in states which have a provision for payment to the families of imprisoned men of sums earned or saved during the period of their sentence. When released on probation the man is often placed under court order to pay an inadequate amount as alimony toward his family's support, on the ground that if forced to give up too much of his earnings he will break probation and leave the jurisdiction. Pressure is often exerted in

Family Desertion and Non-Support — Family Law 81

courts to bring about a reconciliation as the quickest and easiest way of disposing of the case. Experience has taught social workers that these coercive reconciliations are not likely to be durable. All this has discouraged social agencies from relying on legal procedure except where a good court of domestic relations is in operation.

The problem of desertion is an extremely difficult one for the social agencies. A high percentage of deserters (39 in the Boston study) cannot be located; a very small percentage support their families. The necessity for relief is likely to begin soon after desertion—in the Boston study referred to, four out of five families deserted had to seek aid before the end of the first year—and it has frequently to be continued over long periods.

FAMILY ENDOWMENT. *See* FAMILY ALLOWANCES.

FAMILY LAW, or the law of domestic relations, as it is more usually called in Anglo-American law, is in all modern legal systems a

branch of private law. An independent system of family law does not exist. The individual and not the family is the basic unit of the legal order. In truth, however, the continuous operation of the forces of individualism in western society has produced a system of family law which is without any consistency of conception, and it is now private law, now public law. The modern family thus has no organic law. However much its legal constitution is intended to realize individualistic ends, the interest of the state always remains paramount.

In a sense there never existed a family law. The ancient patriarchal family, which in the historical period may be considered the general type of family among the Indo-European races in the West, was a law unto itself. Family law existed only in the sense in which international law does today. It was an interfamily law. The political organization embraced the families, but the head of each was sovereign. The paterfamilias was a benevolent despot. He was the priest of the family cult. So exclusive was the family bond that the solidarity of the family was recognized as the basis of the criminal law. The early patriarchal family was not simply a biological family composed of husband, wife and children, but a larger multiple family or family community variously called *domus*, *Hausgenossenschaft*, *maisonnée* or household, in which were included the married children of the head together with their descendants and domestic slaves. Such a group represented a defensive and offensive alliance.

In both the Latin and Germanic languages the supreme authority of the house lord was expressed in terms of the most obvious symbol of power, the hand. The Roman *manus* and the Germanic *munt*—later Latinized into *mundium*—were the basic concepts of family law and custom. They embraced not only the descendants but all members of the household. In Roman law the term *manus* later became restricted to the power over the wife, and *patria potestas* is now commonly used to express the whole authority of the head of the Roman household.

In the early history of Rome birth did not create the right of membership in the family. A newborn child had to be ceremoniously acknowledged by the paterfamilias, who if he chose could expose the child. The wife *in manu* was completely under the control of her husband; in fact, in contemplation of law she was a sister of her own children in her own household. The

paterfamilias held the power of life and death over all the members of the household, and he could sell or enslave any one of them or yield any wrongdoer in noxal surrender. Not only the family goods but the members of the family were property. Only the paterfamilias was *sui juris*; all the other members of the family were *alieni juris*. Not even sons became emancipated when they reached majority. They might then acquire civil and political rights but they could not hold property or found a new household. For it was the most fundamental rule of the Roman family organization that the *patria potestas* endured as long as the paterfamilias lived.

The later history of the Roman family law under the stress of a growing individualism is of particular interest to the westerner because the modern family in a general way has only repeated it. The dissolution of the ancient Roman patriarchal family, begun under the republic, was fairly complete by the time of Justinian. Custom had long interdicted the absolute rights of the paterfamilias before imperial rescripts restricted domestic rights to powers of chastisement. Caracalla forbade the sale of children except in case of extreme poverty. The *lex julia, de adulteriis*, abolished the husband's power of life and death over his wife. When Justinian suppressed noxal surrender the last *causa mancipii* disappeared. Marriages *sine manu* were made possible through the device of the *trinoctium abesse*. The wife *sine manu* could reserve independent property rights—the *parapherna*—and the dotal system protected the property a wife brought in marriage. Although the *patria potestas* remained perpetual it was undermined through a number of devices, such as a fictitious sale by mancipation which made the son free altogether, or through other devices which made it possible for the son to hold property, such as the extension to the professional classes of the *peculium castrense*, originally property to which the son was independently entitled because it was acquired in consequence of military service. A long development in favor of cognate relationship was completed by the Novels 118 and 127 of Justinian. When the paterfamilias lost the right to constitute the family as he wished, it was plain that the ancient patriarchal family had become simply a legal family.

The modern western family is descended more directly from the Germanic than from the Roman, and it has sometimes been contended that the German *mundium* implied a conception of protection rather than of power; but

this view has little to support it. In early family law rights are generally without reciprocal duties and are intended to profit their holder. Traces of the possession of the power of exposure, sale and life and death are indeed to be found in the very early Middle Ages. Nevertheless, it is true that in the historical period the German house lord was never as absolute a master as the Roman paterfamilias. Doubtless Christian influences had their due effect. Indeed the power of the church must be reckoned as the most important factor in the development of western family law as late as the nineteenth century. Until then family law was largely a branch of canon law. A weakened *mundium* can be traced in the Germanic laws in the early recognition of family joint ownership but especially in the fact that it did not endure during the whole life of the father. While majority did not itself emancipate, a son could by leaving the household establish a new one. On the other hand, with some interruption toward the end of the Middle Ages sex guardianship of adult women prevailed. Still the mother with the growing recognition of cognate relationship often became at least the assistant of the father in his role of family head. In the Anglo-Saxon period in England the wife thus occupied a far more favorable position than she did later under the classic common law.

Despite the general reception of the Roman law in western Europe, the Germanic family law was not greatly affected. To be sure many Roman family law doctrines made their way in the process of "early reception" which was represented by infiltration through the canon law—for instance, the rule *consensus facit nuptias*—and, while the Roman law influenced the family law of persons hardly at all, it did to a measurable extent affect the family law of property, particularly in adding the dotal system and imposing almost the whole law of guardianship. In France in the *pays du droit écrit*, which were the regions of the Roman law, the result was that sons had to be expressly emancipated. It is significant that if Roman law ideas were received they were often such as tended to strengthen the unity of the family. Nevertheless, the growing individualism of Europe toward the end of the Middle Ages was also soon reflected in the acceptance of rules of a contrary character.

The general tendencies in the history of the family law in the orbit of Germanic-Romanic civilization may be summarized as a movement from the patriarchal household, based upon a

rigorously held concept of the solidarity of the family, to the modern biological family which is legally protected because it rears the citizens of the state. In this process agnatic relationship has first given way to bilateral relationship. Restrictions upon alienation of the family property have generally tended to become increasingly attenuated, but here perhaps change has least followed any single pattern and family property systems have shown great variety. The intervention of feudalism alone for a long time arrested the effects of individualism. Children became emancipated before wives, finally simply by reaching majority, and powers of correction over even minor children became very mild. An exception is to be noted in the oldest of the great modern codes, the French *Code civil*, which has retained although in a milder form a father's power to cause the imprisonment of a recalcitrant child, a power that was notoriously exercised under the *ancien régime*. The modern wife has not yet achieved everywhere complete legal independence of person and property but is rapidly doing so under the impulse of the feminist movement. Under the French civil code the wife is still incapable of exercising parental power. Under the more recent German and Swiss civil codes the husband is still the legally recognized head of the family, but the mother shares the parental power and upon the husband's death may exercise it exclusively. The post-war German constitution declares that marriage shall rest upon the concept of equal rights for both sexes but the provision still remains programmatic.

Thus the progress of individualism has not always been either continuous or uniform. It is in the nature of individualism to breed a multiplicity of forms. On the whole, the individualization of the family law has been carried farther under the common law than under the civil law despite the generally more individualistic private law conceptions of the latter. The original implications of status in the very term domestic "relations" has for a long time had no reality. As far as husband and wife are concerned the classic common law abandoned almost completely all ideas of relation. Its most marked characteristic became the rigorouslyness with which it worked out the conception of the unity of husband and wife and made it the basis of the family relation. It was applied not only in the fields of contract and tort but in the criminal law. The wife was not merely subordinated to the husband, as was generally the case in civil law countries. During

coverture—a polite euphemism—her legal personality became absolutely suspended. The relaxation of this system, however, was soon accomplished through equitable channels by means of the trust and the married women's separate estate, which substantially procured for the married woman of the wealthier classes all the rights of property that women generally secured in common law jurisdictions considerably later through the married women's property acts, the foundation of the extreme individualism of the common law of domestic relations.

On the other hand, the civil law countries still retain more of the early Germanic legal conceptions of the family. More than any other European code, perhaps, the French *Code civil*, which was inspired by Napoleon, attempts to realize the idea of the solidarity of the family and also, perhaps more than any other, it has emphasized filial duty. European codes have generally retained the old institution of the family council, but except under the French code its functions are now practically confined to the guardianship of minors. The systems of dotal and community property in European countries undoubtedly help to maintain the integrity of family life, but on the other hand it must be remembered that the codes generally allow the ordinary property system to be varied by contract. Under the law of western countries family rights are thus sometimes based upon the idea of contract, sometimes upon the idea of status. Common law courts too, while they say that marriage is based upon contract but is itself a status, often allow its incidents to be controlled.

Perhaps some importance attaches to the fact that in European countries the family law exists in codified form, which makes it easier for the jurist to formulate its rules and conceptions. Unlike the French civil code the German and Swiss codes have separate books of family law. The Anglo-American law of domestic relations has not really been authoritatively stated since Blackstone. There is room for debate in this third decade of the twentieth century as to who is the legal head of the American family. It is not the husband merely because the law gives him the right to determine the matrimonial domicile. The husband also has this right under the continental codes, but the headship of the family is separately defined. The family law, which is of great popular interest, might well be made available in clear, compact and definite form. From this point of view the codification of family law has much to recommend it, al-

Encyclopaedia of the Social Sciences

though this is not to imply that the family code should become every matrimonial couple's *vade mecum*. The particular advantage of a codified family law is that it proceeds from the normal, not the abnormal. It states positive rules of family obligation under the conditions of family harmony. On the other hand, the fact that Anglo-American law is only precipitated in controversial decisions has tended to make it a law of breach—an emphasis that is too predominantly negative.
